PREFACE

The American Year Book is not a new-comer in the field of publication. Ten volumes appeared covering the years from 1910 to 1919; then for five years publication was suspended. The generous interest of Adolph Ochs has smoothed away difficulties in the way of resuming the work on a larger scale and with a wider survey of American affairs.

The prime motor behind this publication is the forty-five national societies whose representatives constitute an Advisory Board incorporated under the name "American Year Book Corporation." Acting in joint council as a body, and through a Board of Directors, this organization is ultimately responsible for the plan of the work, its scope, its lay-out, and its general point of view. Members of the board have acted as individual representatives in contributing or advising each for his own society in the field of his special knowledge and interest. Without such a general council, and this aid in securing contributors, it would have been impossible to bring together the variety of materials by competent hands necessary for such a work.

The principles of assemblage and subdivision of the Year Book are made clear by the Table of Contents. The whole range of events and discoveries and advances is subdivided into 40 so-called Divisions. These Divisions are all subdivided into sections, aggregating 360. While intended to include a general survey of American matters, it is impossible in the space to include all the fields of intellectual effort and accomplishment; and still more to deal with many additional topics which might be serviceable to readers and users of the book.

Many organizations and individuals, not directly represented in the forty-five societies, have given valued coöperation to the work, and have aided in the selection of contributors. To the volume of 1919, 118 persons contributed. The space in the new volume has been enlarged by about one-third, and the number of contributors has been raised to 256. The list of contributors reveals a broad range, both of subjects and of writers. It has been the aim of the editors throughout to find men and women of standing in their particular fields, who also possessed the gift of statement in literary form.

The plan has been followed of adding, at the end of each Division, a brief statistical survey of the field, where the subject admitted of such treatment; and then a brief list of selected books and periodical articles which appeared upon that general subject during the year 1925. Many references have been added dating from 1923 and 1924, because no Year Books were printed for those years. In future issues it is expected that the statistical and bibliographical data will be enlarged for all divisions.

597765

When the lay-out of the book was under discussion, the question came up whether any effort should be made to fill the gap between the volumes of 1919 and 1925. That could be done, however, only by reducing the space for 1925; and it was decided not to attempt any detailed treatment of events which occurred previous to that year.

The extension of space has made it possible to include several new and important fields. American History has been broken up into American Political History, American Government and American Relations to other Countries. Aëronautics has been made the subject of a Division. American Literature has been separated out of the former title of Literature and Language. A special Division has been created for the Work and Progress of Women. The last few years has seen the development on a great scale of a new type of education; hence the 1925 volume contains a special Division on Vocational Education.

The American Year Book is not intended to be an almanac of various concentrated information and statistics, but a general survey of the advance of the nation for each year, in its succession. It deals, therefore, not simply with political and governmental events, but with the progress of literature, art, science and education. It is intended to bring out particularly the new ideas and to chronicle the new results of scientific and other intellectual activity. It should be a sort of conspectus of the nation's progress.

At the same time it is meant to be a convenient hand-book for the reader and the expert who wish to know in brief what is going on in their own fields and in other fields; or who desire a quick and easy access into the things that have been done in a year. It is hoped that the book will be useful to writers in a great variety of subjects; to the users of libraries, to editors of the periodic and daily press, to publishers, to organizers of public institutions. It is intended to serve the general reader and also to be useful to the specialist who wishes to step outside of his detailed field of interest. It should serve as a hand-book for busy men of all kinds—editors, contributors, professional men, teachers, scientific workers, artists of many kinds, engineers, educators and business men, who wish to verify or confirm points that arise in their minds or to refer to a handy book of reference material, settling questions of fact. To facilitate such use the Table of Contents shows at a glance the Divisions and the Sections. A full and carefully analyzed Index opens up the connections and relations of any desired topic. At the head of every section is the name of the contributor who takes the responsibility.

The process of improving the lay-out of the book can doubtless go much further and the editors will at all times be glad to receive suggestions as to subjects that are not now treated but ought to be included, as to improvements in the classification, and as to general betterments of the plan and its organization. The expectation is that this series will continue indefinitely, so as to form a permanent consecutive record of events and progress in the United States of America.

TABLE OF CONTENTS

PAGE

PREFACE v

CONSTITUENT SOCIETIES AND SUPERVISORY BOARD xiii

CONTRIBUTORS xix

PART ONE: HISTORICAL

I AMERICAN POLITICAL HISTORY 1

Political History.—Presidential Policy.—The President's Views.—Events in Federal Administrative Commissions.—Federal Prosecutions.

II INTERNATIONAL RELATIONS AFFECTING UNITED STATES . . 33

Diplomatic Personnel.—New Diplomatic and Consular Service.—Important Negotiations.—Treaties Completed and Ratified.—European Affairs Interesting to America.—The League of Nations.—The World Court.—Latin-American Relations.—Oriental Relations of the United States.—Influence of the United States on General World Affairs.—The Institute of Politics at Williamstown, Massachusetts.

PART TWO: AMERICAN GOVERNMENT

III CITIZENSHIP AND PERSONAL RIGHTS 76

Rules of Citizenship and Naturalization.—Dual Citizenship.—Limitations on Naturalization.—Freedom of Opinion and Expression.—Bolshevism.—Statistics of Naturalization and Citizenship.—Changes in Electoral Laws.

IV THE NATIONAL GOVERNMENT 97

Changes in the Constitution.—The President and Vice-President.—Unofficial Advisers.—Cabinet Changes.—Federal Administration.—Congress.—Members of the Senate and the House of Representatives.—Personnel of Congress.—Congressional Rules.—The Supreme Court and Constitutional Law.—The National Civil Service.

V STATE AND COUNTY GOVERNMENT 159

National and Inter-State Relations.—State Legislatures.—State Executive and Administration.—State Functions.—Centralization of State Authority.—County Government.—Popular Government.

PAGE

VI MUNICIPAL GOVERNMENT 188

Expansion of Cities.—Zoning and City Planning.—Organizations for City Government.—City Politics.—Municipal Home Rule.—City Manager Government.—Miscellaneous Municipal Problems.—Billboards.—Fire Prevention.

VII TERRITORIES AND DEPENDENCIES 210

Organized Territories and Governments.—The Philippines.—The Island Dependencies.—Land Condemnation.—Water Rights and Water Uses.—The Twelve-Mile and Hour-Run Limits.—Statistics of Territories and Dependencies.—Select Territorial References.

VIII LAW AND JURISPRUDENCE 231

Constitutional Changes in European Countries.—Governmental Developments in Other Countries.—Select Decisions in the Law of Property and Contracts.—Select Decisions in the Law of Torts.—Administrative Law.—Important Legislation.—Prohibition Enforcement.

PART THREE: GOVERNMENTAL FUNCTIONS

IX PUBLIC RESOURCES AND PUBLIC WORKS 253

Public Lands.—Irrigation and Reclamation.—Federal Geological Surveys.—State Geological Surveys.—Public Buildings.—Waterways and Harbors.

X PUBLIC SERVICES AND UTILITIES 276

Public Service Commissions.—Municipal Ownership.—Parks.—Street Traffic.—Water Supply.—Identifications.—Electric Lighting and Power.—Sewage Disposal.—Refuse Collection and Disposal.

XI PUBLIC FINANCE 304

National Income and Outgo.—Taxation.—Revenues of the States.—Expenditures and Indebtedness of the States.—City Finance.—The Budget System.—The Debt of the United States.—The Allies' Debt to the United States.—Statistics of Public Finance.

XII TAXATION 329

Tax Legislation.—Property Taxes.—Income Tax.—Corporation Taxes.—Inheritance Taxes.—Bank Taxation.—Automobile and Licence Taxes.—Publicity of Taxes.—Statistics of National Revenue from Various Taxes.

XIII DEFENCE AND ARMAMENTS 350

The United States Army.—Military Recruiting.—Military Education and Training.—Statistics of Expense and Personnel.—Artillery and Ordnance.—Military Aëronautics.—Military and Naval Pensions.—United States Veterans.—Coast Artillery.—Statistics of the Army.—The United States Navy.—Naval Aëronautics.—Naval Recruiting.—Naval Education and Training.—Warship Construction.

PAGE

PART FOUR: ECONOMICS AND BUSINESS

XIV ECONOMIC AND BUSINESS CONDITIONS 397

The State of Business.—The Iron and Steel Trade.—The Copper Trade.—Foreign Trade.—Building Operations.—Business Failures.—Railroad Traffic and Earnings.—Check Transactions.—The Securities Market.—Financing and Incorporation.—The Money Market.—Index Numbers and the Cost of Living.

XV ORGANIZATION AND CONTROL OF BUSINESS 416

Control of Production.—Price Fixing.—Control of Stock Exchanges.—Blue Sky Laws.—Control of Futures in Wheat, Cotton, etc.—Control of Foreign Trade.—Business and Commercial Statistics.

XVI BANKING AND CURRENCY 437

The National Currency.—The Status of Gold.—Banking.—National Banks.—State Banks.—Trust Companies.—Federal Reserve Banks.—Farm Loan Banks.—Savings Banks.—Postal Savings Banks and Banking.—Consolidation of Banks.—Branch Banking.—Foreign Exchange.—Banking Legislation.—Statistics of Banking.

XVII INSURANCE 460

Life Insurance.—Accident, Health and Disability Insurance.—Fire Insurance.—Marine Insurance.—Automobile Liability Insurance.—Casualty Insurance.—Workmen's Compensation.—Miscellaneous Insurance.

XVIII AGRICULTURE AND FISHERIES 473

Conditions of Agriculture.—Production of Grain Crops.—Live Stock.—Dairying.—Farm Machinery and Progress.—Diseases of Plants.—Diseases and Pests of Animals.—Horticulture.—Forestry.—Fisheries.—Marketing of Crops and Produce.—Agricultural Legislation.—Agricultural Statistics.

XIX MINERAL INDUSTRIES 510

Mining and Ore Dressing.—Coal and Coke.—Petroleum.—Copper.—Gold and Silver.—Iron and Steel.—Zinc.—Lead.—Mineral Statistics.

XX MANUFACTURES 542

General Conditions.—Shipbuilding and Shiprepairing.—Inventions and Patents.—Administration of the Tariff.—Activities of the Tariff Commission.—Magnitude and Progress of Manufacturing.

XXI TRANSPORTATION AND COMMUNICATION 566

Imports and Exports.—Conditions of Internal Commerce.—Highways and Motor Roads.—Railroads.—Railroad and Other Consolidations.—Waterways and Coastwise Commerce.—Merchant Marine.—Urban and Inter-Urban Traction.—Aëronautics.—Motor Bus Service.—Radio Communication.—Express Business.—Telephones and Telegraphs.—Automobile Traffic and Regulation.—Legislation and Court Decisions on Transportation.—Statistics of Transportation and Communication.

PART FIVE: SOCIAL CONDITIONS AND AIMS

XXII JUSTICE AND MAINTENANCE OF ORDER 61

Crime Conditions in the United States.—Mob Violence and Lynchings.—Movements to Check Crime.—Administration of Criminal Justice.—Prisons and Prison Administration.—Institutional Treatment for Defective Delinquents.—New Lights on Crime and Delinquency.—Preventive Work in Delinquency.

XXIII WOMEN'S WORK AND PROGRESS 635

Women's Organizations.—Women in Politics.—Women in Public Life.—Women's Relations to Politics and Government.—Occupations and Conditions of Woman Labor.—Women's Work for Peace.—Literary Achievements of Women.

XXIV SOCIAL PROBLEMS 665

Family Life.—Organized Social Work.—Recreation.—Child Welfare.—Child Labor.—Social Hygiene.—Mental Hygiene.—Social Work of Religious Organizations.—Individual Housing.—Socialism.

XXV IMMIGRATION AND RACES 699

Race Conditions in the United States.—Receiving and Sifting Immigrants.—The Quota System of Admitting Immigrants.—Selection of Immigrants Over-Seas.—Chinese, Japanese and Mexican Immigration.—Deportation of Aliens.—The Registry Plan.—Relation of Immigration to Citizenship.—Statistics of Immigration.

XXVI LABOR AND LABOR LEGISLATION 725

Conditions of Labor in the United States.—Labor Organizations.—International Relations of Labor.—Labor in Politics.—Strikes and Lockouts.—Mediation and Conciliation.—Employment.—Wages and Hours of Labor.—Workmen's Compensation and Health Insurance.—Old Age Pensions.—Labor Representation in Business Management.—Collective Bargaining.—Labor Legislation.

XXVII RELIGION AND RELIGIOUS ORGANIZATIONS 752

The World War and The Churches.—Protestant Activities and Controversies.—Actions of Denominational Bodies.—Baptist Bodies.—Lutheran Bodies.—Methodist Bodies.—Presbyterian Bodies.—Protestant Episcopal Bodies.—The Roman Catholic Church.—Judaism and Jewish Communal Activities.

PART SIX: SCIENCE—PRINCIPLES AND APPLICATION

XXVIII MATHEMATICS AND ASTRONOMY 779

Mathematical Monographs.—Chauvenet Prize.—Recent Advances.—History of Mathematics.—Personal Notes.—Astronomy.—International Astronomical Union.—Southern Observatories.—Eclipse of the Sun.—Comets.—Mars.—Nova Pictoris.—Relativity.—Atomic Theory and Stellar Constitution.—Evolution of the Stars.

PAGE

XXIX ENGINEERING AND CONSTRUCTION 796
Civil Engineering.—Electrical Engineering.—Mechanical Engineering.—Automotive Engineering.—Commercial Aviation.—Naval Architecture and Marine Engineering.—Materials of Engineering.—Standardization.—Statistics of Engineering.

XXX GEOLOGY, METEOROLOGY AND GEOGRAPHY 857
Dynamic and Structural Geology.—Earthquakes and Volcanoes.—Economic Geology.—Mineralogy and Petrology.—Terrestrial Magnetism.—Meteorology and Climatology.—Physical Geography of American Land Areas.—Oceanography and Ocean Exploration.—Cartography.—Explorations in the Americas.—Other Explorations Affecting America.

XXXI CHEMISTRY AND PHYSICS 884
Inorganic and Physical Chemistry.—Biological and Food Chemistry.—Sanitary Chemistry.—Agricultural Chemistry.—Electrochemistry.—Industrial Chemistry and Chemical Engineering.—Physics.—The Atomic Theory.

XXXII BIOLOGICAL SCIENCES 915
Organic Evolution.—Vertebrate Zoölogy.—Invertebrate Zoölogy.—Economic Entomology.—Systematic Entomology.—Vertebrate Paleontology.—Economic Botany.

XXXIII MEDICAL SCIENCES 939
Physiology.—Pharmacology.—Pathology.—Bacteriology.—Medicine.—Surgery.—Public Health and Hygiene.—Vital Statistics.

XXXIV PHILOSOPHICAL AND SOCIAL SCIENCES 966
Philosophy.—Psychology.—Anthropology and Ethnology.—Sociology.—Sociology Applied to History and Government.—Mental Tests and Measurements.

PART SEVEN: THE HUMANITIES

XXXV AMERICAN LITERATURE 989
Interests and Tests.—Fiction.—Biography.—Poetry.—Belles Lettres.

XXXVI LITERATURE AND LANGUAGE 1002
English Language and Literature.—Germanic Languages and Literature.—Romance Languages and Literature.—Ancient Literature and Philology.—Latin.—Greek.—Semitic Languages and Literature.—Indo-European Philology.—International Auxiliary Language.—Modern Languages.—Book Publishing.

XXXVII THE ARTS 1032
Painting.—Sculpture.—Architecture and Architectural Affairs.—Landscape Architecture.—Classical Archæology.—Art Sales and Exhibitions.—Statistics of the Arts.

XXXVIII MUSIC AND DRAMA 1055
Radio and Music.—Radio and the American Composer.—Opera.—Jazz Opera.—Symphonic, Choral and Other Novelties.—Musical Literature.—The Theatre.—Notable Plays.—Moving Pictures.—Notable Films.

XXXIX Academic Education 1073

Modern Methods in Education.—Immigrant Education.—Health, Physical and Sex Education.—Primary and Grade Schools.—High Schools.—Colleges and Universities.—Professional Schools.—Training and Tenure of Teachers.—Exchanges of Teachers and Students with Foreign Countries.—Educational Statistics.

XL Vocational Education 1093

Concepts in Vocational Education.—Relation of the Federal Government to Vocational Education.—State Vocational Training.—Semi-Public and Philanthropic Schools.—Groups Served by Vocational Education.—Purposes of Vocational Education.—Opportunities of Vocational Education.—Vocational Education Statistics.

CONSTITUENT SOCIETIES AND SUPERVISORY BOARD

SOCIETIES REPRESENTED

1. **ACADEMY OF POLITICAL SCIENCE IN THE CITY OF NEW YORK.**
George W. Ochs Oakes, New York Times.

2. **ACTUARIAL SOCIETY OF AMERICA.**
Wendell M. Strong, 32 Nassau Street, New York.

3. **AMERICAN ACADEMY OF POLITICAL AND SOCIAL SCIENCE.**
Dr. Ernest M. Patterson, University of Pennsylvania, Philadelphia.

4. **AMERICAN ANTHROPOLOGICAL ASSOCIATION.**
Prof. George Grant MacCurdy, Yale University, New Haven.

5. **AMERICAN ANTIQUARIAN SOCIETY.**
Waldo Lincoln, Worcester, Massachusetts.

6. **AMERICAN ASSOCIATION OF ECONOMIC ENTOMOLOGISTS.**
E. Porter Felt, State Entomologist, Albany, New York.

7. **AMERICAN ASSOCIATION FOR THE ADVANCEMENT OF SCIENCE.**
Prof. Edward G. Conklin, Princeton University, Princeton.

8. **AMERICAN ASSOCIATION FOR LABOR.**
Prof. Henry W. Farnam, Yale University, New Haven.

9. **AMERICAN ASTRONOMICAL SOCIETY.**
Prof. Henry N. Russell, Princeton University, Princeton.

10. **AMERICAN BANKERS ASSOCIATION.**
W. E. Knox, President, Bowery Savings Bank, New York.

11. **AMERICAN BAR ASSOCIATION.**
Associate Justice Harlan F. Stone, Washington.

12. **AMERICAN CHEMICAL SOCIETY.**
Col. Marston T. Bogert, 422 W. 154th Street, New York.

13. **AMERICAN ECONOMIC ASSOCIATION.**
Prof. Edwin R. A. Seligman, Columbia University, New York.

14. **AMERICAN FEDERATION OF ARTS.**
Herbert Adams, 131 W. 11th Street, New York.

15. **AMERICAN HISTORICAL ASSOCIATION.**
Prof. Albert Bushnell Hart, Harvard University, Cambridge.

16. **AMERICAN INSTITUTE OF ARCHITECTS.**
C. Grant La Farge, 101 Park Avenue, New York.

17. **AMERICAN INSTITUTE OF CRIMINAL LAW.**
Dr. George W. Kirchwey, 105 E. 22nd Street, New York.

18. **AMERICAN INSTITUTE OF ELECTRICAL ENGINEERS.**
Edward Caldwell, 370 Seventh Avenue, New York.

19. **AMERICAN INSTITUTE OF MINING ENGINEERS.**
Prof. Bradley Stoughton, Lehigh University, Bethlehem, Pa.

20. **AMERICAN INSTITUTE OF RADIO ENGINEERS.**
Dr. A. M. Goldsmith, Radio Corporation, Van Cortlandt Park South, New York.

21. **AMERICAN LIBRARY ASSOCIATION.**
James I. Wyer, Jr., State Librarian, Albany, New York.

22. **AMERICAN MATHEMATICAL SOCIETY.**
Prof. E. B. Wilson, Columbia University, New York.

23. **AMERICAN MEDICAL ASSOCIATION.**
Dr. Alexander Lambert, 43 E. 72nd Street, New York.

24. **AMERICAN ORIENTAL SOCIETY.**
Prof. A. V. Williams Jackson, Columbia University, New York.

25. **AMERICAN PALEONTOLOGICAL SOCIETY.**
Dr. William D. Matthew, American Museum of Natural History, New York.

26. **AMERICAN PHILOLOGICAL ASSOCIATION.**
Dr. John C. Rolfe, University of Pennsylvania, Philadelphia.

27. **AMERICAN PHYSICAL SOCIETY.**
Prof. Edward L. Nichols, Cornell University, Ithaca, New York.

28. **AMERICAN POLITICAL SCIENCE ASSOCIATION.**
Prof. W. W. Willoughby, Johns Hopkins University, Baltimore.

29. **AMERICAN PUBLIC HEALTH ASSOCIATION.**
Dr. Milton J. Rosenau, 65 Naples Road, Brookline, Massachusetts.

30. **AMERICAN SOCIETY OF INTERNATIONAL LAW.**
Prof. George G. Wilson, Harvard University, Cambridge.

31. **AMERICAN SOCIETY OF MECHANICAL ENGINEERS.**
Calvin W. Rice, Engineers Building, 29 West 39th Street, New York.

32. **AMERICAN SOCIETY FOR TESTING MATERIALS.**
F. M. Farmer, 1315 Spruce Street, Philadelphia.

33. **AMERICAN SOCIOLOGICAL SOCIETY.**
Prof. Franklin H. Giddings, Columbia University, New York.

34. **AMERICAN STATISTICAL ASSOCIATION.**
Prof. Walter F. Willcox, Cornell University, Ithaca, New York.

35. **ARCHÆOLOGICAL INSTITUTE OF AMERICA.**
Ralph Van Deman Magoffin, New York University, New York.

36. **BOTANICAL SOCIETY OF AMERICA.**
Dr. George T. Moore, Missouri Botanical Gardens, St. Louis.

37. **GENERAL FEDERATION OF WOMEN'S CLUBS.**
Mary Garrett Hay, 171 Madison Avenue, New York.

38. **GEOLOGICAL SOCIETY OF AMERICA.**
Prof. William M. Davis, Harvard University, Cambridge.

39. **NATIONAL AÉRONAUTIC ASSOCIATION.**
Godfrey Cabot, 16 Highland Street, Cambridge, Massachusetts.

40. **NATIONAL CONFERENCE OF SOCIAL WORK.**
Dr. Hastings Hornell Hart, Russell Sage Foundation, Lexington Avenue and 22nd Street, New York.

41. **NATIONAL EDUCATION ASSOCIATION.**
Chancellor Elmer E. Brown, New York University, New York.

42. **NATIONAL GEOGRAPHIC SOCIETY.**
Dr. Gilbert Grosvenor, National Geographic Society, Washington.

43. **NATIONAL MUNICIPAL LEAGUE.**
Clinton R. Woodruff, 719 North American Building, Philadelphia.

44. **NATIONAL SOCIETY OF VOCATIONAL EDUCATION.**
L. H. Dennis, State Director of Vocational Education, Harrisburg, Pennsylvania.

45. **THE SOCIETY OF NAVAL ARCHITECTS AND MARINE ENGINEERS.**
Capt. W. M. McFarland, 85 Liberty Street, New York.

REPRESENTATIVES OF SOCIETIES

HERBERT ADAMS, 131 West 11th Street, New York.
American Federation of Arts.

COL. MARSTON T. BOGERT, 422 W. 154th Street, New York.
American Chemical Society.

CHANCELLOR ELMER E. BROWN, New York University, New York.
National Education Association.

GODFREY CABOT, 16 Highland Street, Cambridge.
National Aëronautic Association.

EDWARD CALDWELL, 370 Seventh Avenue, New York.
American Institute of Electrical Engineers.

PROF. EDWARD G. CONKLIN, Princeton University, Princeton.
American Association for the Advancement of Science.

PROF. WILLIAM M. DAVIS, Harvard University, Cambridge.
Geological Society of America.

L. H. DENNIS, State Director of Vocational Education, Harrisburg, Pa.
National Society of Vocational Education.

F. M. FARMER, 1315 Spruce Street, Philadelphia.
American Society for Testing Materials.

PROF. HENRY W. FARNHAM, New Haven, Connecticut.
American Association for Labor.

E. PORTER FELT, State Entomologist, Albany, New York.
American Association of Economic Entomologists.

PROF. FRANKLIN H. GIDDINGS, Columbia University, New York.
American Sociological Society.

DR. A. M. GOLDSMITH, Radio Corporation, Van Cortland Park, South, New York.
American Institute of Radio Engineers.

DR. GILBERT GROSVENOR, National Geographic Society, Washington.
National Geographic Society.

PROF. ALBERT BUSHNELL HART, Harvard University, Cambridge.
American Historical Association.

DR. HASTINGS HORNELL HART, Russell Sage Foundation, Lexington Ave. and 22nd St., New York.
National Conference of Social Work.

MARY GARRETT HAY, 171 Madison Avenue, New York
General Federation of Women's Clubs.

PROF. A. V. WILLIAMS JACKSON, Columbia University, New York.
American Oriental Society.

PROF. GEORGE W. KIRCHWEY, 105 East 22nd Street, New York.
American Institute of Criminal Law.

W. E. KNOX, President Bowery Savings Bank, New York.
American Bankers Association.

C. GRANT LA FARGE, 101 Park Avenue, New York.
American Institute of Architects.

DR. ALEXANDER LAMBERT, 43 East 72nd Street, New York.
American Medical Association.

WALDO LINCOLN, Worcester, Massachusetts.
American Antiquarian Society.

PROF. GEORGE GRANT MAC CURDY, Yale University, New Haven.
American Anthropological Association.

CAPT. W. M. McFARLAND, 85 Liberty Street, New York.
The Society of Naval Architects and Marine Engineers.

RALPH VAN DEMAN MAGOFFIN, New York University, New York.
Archæological Institute of America.

DR. WILLIAM D. MATTHEW, American Museum of Natural History, New York.
American Paleontological Society.

DR. GEORGE T. MOORE, Missouri Botanical Gardens, St. Louis.
Botanical Society of America.

PROF. EDWARD L. NICHOLS, Cornell University, Ithaca, New York.
American Physical Society.

American Statistical Association.

PROF. W. W. WILLOUGHBY, Johns Hopkins University, Baltimore.
American Political Science Association.

PROF. E. B. WILSON, Columbia University, New York.
American Mathematical Society.

PROF. GEORGE G. WILSON, Harvard University, Cambridge.
American Society of International Law.

CLINTON R. WOODRUFF, 719 North American Building, Philadelphia.
National Municipal League.

JAMES I. WYER, Jr., State Librarian, Albany, New York.
American Library Association.

CONTRIBUTORS

P. G. Agnew, B.L., A.M., Ph.D.: STANDARDIZATION.
Secretary, American Engineering Standards Committee.

Carroll S. Alden, B.A., Ph.D.: NAVAL EDUCATION.
Professor of English at U. S. Naval Academy.

Charles R. Allen, B.Sc.: VOCATIONAL EDUCATION.
Editor and Educational Consultant, Federal Board for Vocational Education.

Mary Anderson: WOMAN LABOR.
Chief of Women's Bureau, U. S. Department of Labor; chairman of conference of all national organizations of women; member, Academy of Political and Social Science, American Association for Labor Legislation, Women's Trade Union League.

Clement W. Andrews: BIOLOGICAL SCIENCES.
Librarian, John Crerar Library, Chicago.

Irene Osgood Andrews, A.B.: LABOR LEGISLATION.
Assistant Secretary, American Association for Labor Legislation.

John B. Andrews, A.B., A.M., Ph.D.: UNEMPLOYMENT.
Secretary, American Association for Labor Legislation.

Wallace W. Atwood, B.Sc., Ph.D.: PHYSICAL GEOGRAPHY.
President, Clark University and Clark College; fellow, Geological Society of America; member, Association of American Geographers, Commission Internationale de l'Atlas des Formes du Relief Terrestre.

Leonard S. Austin: COPPER.
Mining engineer, Los Angeles, California.

Peter Bain: NAVAL CONSTRUCTION; SHIPBUILDING; MERCHANT MARINE.
Editor, *Shipping*, New York.

Jennie Loitman Barron, A.B., LL.B., LL.M.: WOMAN CITIZENSHIP.
Member of the Massachusetts Bar, and of the Bar of the U. S. Supreme Court; chairman of Courts Committee on Legal Status of Women, Massachusetts League of Women Voters.

George A. Barton, A.B., A.M., Ph.D., LL.D.: SEMITIC LANGUAGES AND LITERATURE.
Professor of Semitic Languages at University of Pennsylvania.

William N. Bates, A.B., A.M., Ph.D.: CLASSICAL ARCHÆOLOGY.
Professor, and Head of Department of Greek, University of Pennsylvania; editor-in-chief, *American Journal of Archæology;* member, American Philological Association.

John Bauer: PUBLIC SERVICE COMMISSIONS.
City Law Department, New York.

Albert Croll Baugh, Ph.D.: ENGLISH LANGUAGE AND LITERATURE.
Assistant Professor of English at University of Pennsylvania.

Ethel L. Baxter: BANKING BIBLIOGRAPHY.
Librarian, American Bankers' Association.

Harold R. Bayley: FOREIGN EXCHANGE.
Bayley & Mills, foreign exchange brokers, New York.

May Lamberton Becker: BIBLIOGRAPHY OF WOMEN'S WORK; LITERARY CONTRIBUTIONS OF WOMEN.
Contributing Editor, *The Saturday Review of Literature;* lecturer on contemporary literature.

D. D. Berolzheimer, Ph.D.: BIBLIOGRAPHY OF CHEMISTRY AND PHYSICS.
Consulting Bibliogapher; member, American Chemical Society.

Morris Bien, Ph.B., LL.B., LL.M.: PUBLIC RESOURCES AND PUBLIC WORKS.
Civil Engineer; Attorney and Counsellor at Law, Washington.

Archibald Black: COMMERCIAL AVIATION.
Consulting Aëronautical Engineer; member, Society of Automotive Engineers, Aëro Chamber of Commerce, National Aëronautic Association.

Henry W. Blake, Ph.B.: URBAN AN INTERURBAN TRACTION.
Senior Editor, *Electric Railway Journal*, New York; member, American Institute of Electrical Engineers, American Electric Railway Association.

L. E. Bowman, A.B.: RECREATION.
Instructor in Sociology at Columbia University; secretary, City Recreation Committee, New York.

S. J. Brandenburg, Ph.D.: LAND CONDEMNATION; WATER RIGHTS.
Professor of Economics and Sociology at Clark University.

Hugh A. Brown, Ph.D.: RECLAMATION AND IRRIGATION.
Chief, Division of Settlement and Economic Operations, Bureau of Reclamation, U. S. Department of the Interior.

Robert M. Brown, Ph.D.: EXPLORATIONS.
Professor, Department of Geology and Geography, Rhode Island College of Education.

C. A. Browne, B.A., M.A., Ph.D.: AGRICULTURAL CHEMISTRY.
Chief, Bureau of Chemistry, U. S. Department of Agriculture.

Andrew A. Bruce, A.B., LL.B.: CRIMINAL JUSTICE.
Professor at Northwestern University Law School; member, American Bar Association; vice-president, National Commission on Uniform State Laws.

Friedrich Bruns, Ph.D.: GERMANIC LANGUAGES AND LITERATURE.
Associate Professor of German at University of Wisconsin.

William E. Buffington: POSTAL BANKING.
Director of Postal Savings, U. S. Post Office Department.

W. Randolph Burgess, A.B., A.M., Ph.D.: FEDERAL RESERVE BANKS.
Assistant Federal Reserve Agent, Federal Reserve Bank, New York; member, American Statistical Association.

Allison Butts, A.B., S.B.: LEAD.
Assistant Professor of Metallurgy at Lehigh University; Associate Editor, *The Mineral Industry.*

Godfrey L. Cabot, A.B.: AIR NAVIGATION.
President, National Aëronautic Association of the United States of America.

W. F. Callander, Ph.D.: GRAIN CROPS.
Chairman, Crop Reporting Board, Bureau of Agricultural Economics, U. S. Department of Agriculture.

Leon Cammen, M.A.: MECHANICAL ENGINEERING.
Associate Editor of *Mechanical Engineering.*

Ernest W. Camp: TARIFF ADMINISTRATION.
Director of Customs, Division of Customs, U. S. Treasury Department.

H. K. Carroll, LL.D.: RELIGION AND RELIGIOUS ORGANIZATION.
Secretary, Ecumenical Methodist Commission; Corresponding Secretary, Francis Asbury Memorial Association.

C. C. Carstens: CHILD WELFARE.
Executive Director, Child Welfare League of America.

Harcourt L. Caverly, A.B.: TRANSPORTATION AND COMMUNICATION.
Assistant Professor of Economics at University of Michigan.

Howard L. Clark: MANUFACTURING STATISTICS.
Assistant to the Editor, *Manufacturers Record,* Baltimore.

F. A. Cleveland, Ph.B., Ph.D.: BUDGET SYSTEM.
Professor of Citizenship at Boston University.

H. Burdett Cleveland: REFUSE DISPOSAL.
Consulting Sanitary Engineer, New York.

F. W. Coe: FORTIFICATIONS.
Major General, U. S. A.; Chief of Coast Artillery, War Department.

Alzada Comstock, Ph.D.: INHERITANCE TAXES; PUBLICITY OF TAXES.
Associate Professor of Economics at Mt. Holyoke College.

Edwin F. Cone: IRON AND STEEL.
Associate Editor, *The Iron Age,* New York.

Milton Conover, Ph.D.: PERSONNEL AND RULES OF CONGRESS.
Assistant Professor of Government at Yale University.

Arthur E. Cook, LL.B.: IMMIGRATION.
Assistant to the Secretary of Labor.

R. A. Cooper: FARM LOAN BANKS.
Commissioner, Federal Farm Loan Bureau, Treasury Department.

Douglas F. Cox: MARINE INSURANCE.
President, United States Merchants' and Shippers' Insurance Company, New York.

Robert T. Crane, Ph.D.: CITY PLANNING.
Professor of Political Science at University of Michigan.

Harrison W. Craver, B.Sc.: MINERAL INDUSTRIES BIBLIOGRAPHY; ENGINEERING BIBLIOGRAPHY.
Librarian of Engineering Societies Library, New York.

Nelson Antrim Crawford, B.A., M.A.: AGRICULTURAL BIBLIOGRAPHY.
Director of Information, Bureau of Publications, U. S. Department of Agriculture.

Raymond P. Crist, LL.B.: RELATION OF IMMIGRATION TO CITIZENSHIP.
Commissioner of Naturalization, Bureau of Naturalization, U. S. Department of Labor.

H. Lamar Crosby, A.M., Ph.D.: GREEK LITERATURE.
Professor of Greek at University of Pennsylvania.

Joseph E. Cummings: RAILROADS, CONSOLIDATION.
Professor in the School of Business, University of Minnesota.

John Gould Curtis, A.B., LL.B.: WAGES AND HOURS OF LABOR.
Member of the Pennsylvania Bar; fellow, American Geographical Society.

Frank Cushman, A.B.: VOCATIONAL EDUCATION.
Chief, Trade and Industrial Education Service, Federal Board for Vocational Education.

Arthur H. Daniels, A.B., B.D., Ph.D.: PROFESSIONAL SCHOOLS.
Dean of Graduate School, University of Illinois; member, American Philosophical Association.

J. B. Davidson, B.Sc., M.E., A.E.: FARM MACHINERY.
Professor of Agricultural Engineering at Iowa State College; member, American Society of Agricultural Engineers, Society of Automotive Engineers.

Herbert Davis, M.D.: SURGERY.
Director of Laboratory of Experimental Surgery, University of Nebraska Medical School.

W. H. Davis, A.B., M.D.: VITAL STATISTICS.
Chief Statistician for Vital Statistics, Bureau of the Census, U. S. Department of Commerce.

J. H. Dellinger, A.B., Ph.D.: RADIO.
Chief of Radio Laboratory, Bureau of Standards, U. S. Department of Commerce; President, The Institute of Radio Engineers; member, American Geophysical Union.

Davis R. Dewey, A.B., Ph.D., LL.D.: PUBLIC FINANCE.
Professor of Economics and Statistics at Massachusetts Institute of Technology; managing editor, *American Economic Review;* fellow, American Academy of Arts and Sciences.

Emma H. de Zouche: WOMEN'S WORK.
Political writer and Feminist.

Paul H. Douglas, Ph.D.: WORKMEN'S COMPENSATION; OLD AGE PENSIONS.
Professor in School of Commerce and Administration, University of Chicago.

Raymond S. Dugan, B.A., M.A., Ph.D.: ASTRONOMY.
Professor of Astronomy at Princeton University; fellow, American Association for the Advancement of Science; member, American Astronomical Society.

F. Lowell Dunn, B.S., M.D.: MEDICINE.
Assistant Professor at University of Nebraska Medical School.

Gurden Edwards: BANKS AND BANKING.
Director, Public Relations Commission, American Bankers Association.

W. Elmer Ekblaw, B.Sc.: ECONOMIC GEOLOGY.
Managing Editor, *Economic Geography,* Clark University.

Ray H. Everett, A.B., LL.B.: SOCIAL HYGIENE.
Director, Department of Public Information, American Social Hygiene Association; managing editor, *Journal of Social Hygiene.*

E. Porter Felt, D.Sc.: SYSTEMATIC ENTOMOLOGY.
State Entomologist, State Museum, University of the State of New York; Editor, *Journal of Economic Entomology;* member, American Association of Economic Entomologists.

John F. Fennelly: CONTROL OF PRODUCTION.
Associate Editor, *Commerce and Finance,* New York.

Charles G. Fenwick, A.B., Ph.D.: INTERNATIONAL NEGOTIATIONS
Professor of Political Science at Bryn Mawr College.

Colin G. Fink, B.A., M.A., Ph.D.: ELECTROCHEMISTRY.
Professor, Department of Chemical Engineering, Columbia University; secretary, American Electrochemical Society; member, National Research Council, American Institute of Mining and Metallurgical Engineers.

CONTRIBUTORS

Morris Fishbein, B.Sc., M.D.: MEDICAL BIBLIOGRAPHY.
Editor, *Journal of the American Medical Association;* associate in the History of Medicine at University of Chicago School of Medicine.

Ralph Flint: SCULPTURE.
Art Critic for *The Christian Science Monitor.*

Richard W. Flournoy, Jr.: CITIZENSHIP AND NATURALIZATION.
Department of State.

Robert F. Foerster, A.B., Ph.D.: RACE CONDITIONS.
Professor of Economics at Princeton University; director of Industrial Relations Section, Department of Economics and Social Institutions; member, American Economics Association.

James Ford, Ph.D.: INDIVIDUAL HOUSING.
Associate Professor of Social Ethics at Harvard University; Executive Director, Better Homes in America.

George W. Fuller, S.B.: SEWAGE DISPOSAL.
Hydraulic and Sanitary Engineer, New York.

William Addleman Ganoe: THE ARMY.
Major, U. S. A.; Historical Section, Army War College.

Harry S. Ganders, Ph.D.: TRAINING AND TENURE OF TEACHERS.
Professor of Educational Administration at Colorado State Teachers College.

Frederick W. Gehle: STATUS OF GOLD.
Vice-President, Mechanics and Metals National Bank, New York.

John M. Gillette, A.B., A.M., Ph.D.: FAMILY LIFE.
Professor and Head of Department of Sociology, University of North Dakota; member, Advisory Board of National Child Labor Committee, American Sociological Society.

J. L. Gillin, B.Litt., A.B., A.M., Ph.D., B.D.: JUSTICE AND ORDER.
Professor of Sociology at University of Wisconsin; member, American Sociological Society; member, National Conference for Social Work.

Sheldon Glueck, Ph.D., LL.M.: CRIME AND DELINQUENCY.
Instructor, Department of Social Ethics, Harvard University; member of New York State Bar.

John M. Goodell: CIVIL ENGINEERING.
Consulting Engineer, New York; member, American Society of Civil Engineers.

Ernest P. Goodrich, B.Pd., B.Sc.: STREETS.
Consulting Engineer; Sage Foundation.

Thomas W. Gosling, Ph.D.: HIGH SCHOOLS.
Superintendent of Schools, Madison, Wisconsin.

Frank D. Graham, Ph.D.: CONDITIONS OF COMMERCE.
Professor of Economics at Princeton University.

Henry S. Graves, A.B., A.M.: Forestry.
Dean of School of Forestry, Yale University; honorary member, Royal British Arboricultural Society; fellow, American Geographical Society; honorary member, American Academy of Arborists.

H. Noyes Greene: Legislation and Jurisprudence.
Editor with The Edward Thompson Company, Northport, New York.

Sarah Greer: Public Utilities.
Librarian, Bureau of Municipal Research, National Institute of Public Administration.

R. Dawson Hall: Coal and Coke.
Engineering Editor, *The Coal Age*, New York.

C. L. Hall: Military Bibliography.
Major, U. S. A., Office of Chief of Staff, War Department.

J. M. Hall: Vocational Guidance and Placement.
Regional Agent, Federal Board for Vocational Education, Washington.

George L. Hamilton, A.B., A.M., Ph.D.: Romance Languages and Literature.
Professor of Romance Languages and Literatures at Cornell University.

Frank H. Hankins, A.B., Ph.D.: Bibliography of Social Problems.
Professor of Sociology at Smith College; member, American Sociological Society, Academy of Political Science, Sociological Society of London.

William E. Hannan: Tax Legislation.
Legislative Reference Librarian, New York State Library.

E. R. Hardy: Fire Insurance.
Assistant Manager, New York Fire Insurance Exchange.

J. Arthur Harris, A.B., A.M., Ph.D.: Statistics of Biology.
Professor of Botany at University of Minnesota; member, American Society of Naturalists, Botanical Society of America.

Albert Bushnell Hart, A.B., Ph.D., LL.D., Litt.D.: The National Government.
Eaton Professor of the Science of Government at Harvard University.

Helen Hart, A.B.: Immigrant Education.
Head Worker, East Side Settlement House, New York.

Hornell Hart, A.B., Ph.D.: Social Work.
Associate Professor of Social Economy at Bryn Mawr College.

R. J. Haskell, Ph.D.: Plant Diseases.
Assistant Pathologist in Charge, Plant Disease Survey, Bureau of Plant Industry, U. S. Department of Agriculture.

Robert A. Hatcher, Ph.G., M.D.: PHARMACOLOGY.
Professor of Pharmacology at Cornell Medical School; member, American Society of Pharmacology and Experimental Therapeutics.

Daniel L. Hazard, A.B.: TERRESTRIAL MAGNETISM.
Assistant Chief, Division of Terrestrial Magnetism and Seismology, U. S. Coast and Geodetic Survey.

James B. Hedges, Ph.D.: TERRITORIES AND DEPENDENCIES.
Associate Professor of American History at Clark University.

Margaret de Forest Hicks: DIPLOMATIC PERSONNEL.
Author and Political Expert in Military Intelligence Division, War Department General Staff.

Charles E. Hill, A.B., A.M., Ph.D.: TWELVE MILE LIMIT; TERRITORIES AND DEPENDENCIES.
Professor of Political Science at George Washington University.

Frank T. Hines, LL.D.: VETERANS.
Brigadier General, O. R. C.; Director, U. S. Veterans' Bureau.

Frederick L. Hoffman, LL.D.: CRIME CONDITIONS.
Consulting Statistician, Prudential Insurance Company, Newark.

Arthur N. Holcombe, A.B., Ph.D.: THE NATIONAL GOVERNMENT.
Professor of Government at Harvard University.

William A. Hooker, B.Sc., LL.M., D.V.M.: ECONOMIC ENTOMOLOGY.
Editor Department of Economic Entomology, *Experiment Station Record,* U. S. Department of Agriculture.

J. Edgar Hoover: IDENTIFICATIONS.
Director, Bureau of Investigation, U. S. Department of Justice.

H. L. Horning: AUTOMOBILE ENGINEERING.
President, Society of Automotive Engineers; President and General Manager, Waukesha Motor Company.

Frances R. Howard: STATISTICS OF ART.
Editor, *American Art Annual.*

Henry V. Hubbard, A.B., A.M., S.B.: PARKS.
Professor of Landscape Architecture at Harvard University; Chief Editor, *Landscape Architecture;* fellow, American Society of Landscape Architects; member, American City Planning Institute.

A. H. Hubbell: PETROLEUM.
Managing Editor, *Engineering and Mining Journal-Press.*

Solomon S. Huebner, B.S., M.S., Ph.D.: ECONOMIC AND BUSINESS CONDITIONS.
Professor of Insurance and Commerce at University of Pennsylvania; Associate Editor, *Annals of American Academy of Political and Social Science;* member, American Institute of Banking.

Merlin H. Hunter, Ph.D.: PUBLIC FINANCE.
Associate Professor of Economics at University of Illinois.

W. R. Ingalls, S.B., E.D.: ZINC.
Consulting Engineer, New York; member, American Institute of Mining and Metallurgical Engineers.

William M. Jardine, B.Sc., LL.D.: FARMING.
Secretary of Agriculture; fellow, American Association for the Advancement of Science; member, Executive Board, National Research Council; Advisory Council, Agricultural Commission of the American Bankers Association.

H. S. Jennings, B.Sc., A.M., Ph.D., LL.D., D.Sc.: ORGANIC EVOLUTION.
Henry Walters, Professor of Zoölogy and director of Zoölogical Laboratory, Johns Hopkins University; member, Society of Experimental Biology and Medicine.

Jens P. Jensen, Ph.D.: TAXATION.
Professor of Economics at University of Kansas.

W. L. G. Joerg: CARTOGRAPHY.
Editor, Research Series, American Geographical Society; member, Division of Geology and Geography, National Research Council.

F. Ernest Johnson, A.B., B.D.: PROHIBITION.
Executive Secretary, Department of Research and Education, Federal Council of Churches of Christ in America.

James Weldon Johnson, A.B., A.M., Litt. D.: MOB VIOLENCE AND LYNCHING.
Secretary, National Association for Advancement of Colored People; director, American Fund for Public Service.

Robinson G. Jones, A.B., A.M., D.Pd.: MODERN METHODS IN EDUCATION.
Superintendent of Schools, Cleveland.

Frank J. Katz: MINERAL STATISTICS.
Engineer in charge, Division of Mineral Resources and Statistics, Bureau of Mines, U. S. Department of Commerce.

Charles H. Keene, M.D.: HEALTH, PHYSICAL AND SEX EDUCATION.
Professor of Hygiene and Director of Physical Education at University of Buffalo.

James F. Kemp, A.B., D.Sc., E.M., LL.D.: BIBLIOGRAPHY OF BIOLOGY.
Professor of Geology at Columbia University; manager and scientific director, New York Botanical Gardens.

Theodore Reed Kendall, S.B., M.C.E.: WATER SUPPLY.
Engineering Editor, *American City Magazine;* associate member, American Society of Civil Engineers; member, American Water Works Association, New England Water Works Association.

E. H. Kennard, Ph.D.: PHYSICS.
Assistant Professor of Physics at Cornell University.

Roland G. Kent, B.A., B.L., M.A., Ph.D.: INDO-EUROPEAN PHILOLOGY; INTERNATIONAL AUXILIARY LANGUAGES.
Professor of Comparative Philology at University of Pennsylvania; Secretary, Linguistic Society of America.

Charles Kettleborough: ELECTORAL LAWS.
Director, Indiana Legislative Bureau.

James E. Kindred, Ph.D.: VERTEBRATE ZOÖLOGY.
Assistant Professor of Histology and Embryology at University of Virginia.

William A. Kinnan, B.Sc., M.D.: PATENTS AND INVENTIONS.
First Assistant Commissioner, U. S. Patent Office, Department of Commerce; member of the Bar of the U. S. Supreme Court; member, National Research Council.

Julius Klein, B.Litt., A.M., Ph.D.: FOREIGN TRADE.
Director, Bureau of Foreign and Domestic Commerce, U. S. Department of Commerce; member, American Economics Associatio American Historical Association.

C. F. Klinefelter: ORGANIZATIONS FOR VOCATIONAL EDUCATION.
Special Agent for Trade and Industrial Education, Federal Board for Vocational Education.

John A. Krout, A.B., A.M.: POLITICAL HISTORY.
Instructor in History at Columbia University.

Herbert S. Langfeld, A.B., Ph.D.: PSYCHOLOGY.
Professor of Psychology and Director of the Psychological Laboratory, Princeton University.

C. W. Larson, B.Sc., M.S., Ph.D.: DAIRYING AND LIVE STOCK.
Chief of Bureau of Dairying, U. S. Department of Agriculture; member, American Dairy Science Association, Washington Academy of Sciences.

Algernon Lee: SOCIALISM.
Educational Director, Rand School of Social Science; an editor of *The New Leader.*

M. M. Leighton: STATE GEOLOGICAL SURVEYS.
Chief, Illinois Geological Survey; Secretary, Association of American State Geologists.

Charles E. Locke, S. B.: MINING AND ORE DRESSING.
Professor of Mining Engineering at Massachusetts Institute of Technology; member, American Institute of Mining Engineers.

Owen R. Lovejoy, A.B., A.M., LL.D.: CHILD LABOR.
General Secretary, National Child Labor Committee; Editor, *The American Child;* director, Information Bureau, American Child Health Association; director, American Political Science Association.

A. H. MacCormick, Ph.D.: PRISONS.
Professor at Bowdoin College.

George Grant MacCurdy, A.B., A.M., Ph.D.: ANTHROPOLOGY AND ETHNOLOGY.
Research Associate in Prehistoric Archæology with Professorial Rank; Curator of Anthropology, Peabody Museum, Yale University; director of the American School of Prehistoric Research.

Thomas H. MacDonald, B.C.E.: HIGHWAYS AND MOTOR ROADS.
Chief, Bureau of Public Roads, U. S. Department of Agriculture.

Arch Mandel, A.B.: POLICE.
Director, Dayton Research Association; member, American Institute of Criminal Law and Criminology, National Municipal League.

Lawrence B. Mann: MANUFACTURES.
Acting Chief, Division of Statistical Research, Bureau of Foreign and Domestic Commerce, U. S. Department of Commerce.

H. A. Marmer, B.Sc.: OCEANOGRAPHY AND OCEAN EXPLORATION.
Assistant Chief, Division of Tides and Currents, U. S. Coast and Geodetic Survey.

J. Clyde Marquis, B.Sc., M.S.: AGRICULTURAL LEGISLATION.
Director of Economic Information, Bureau of Agricultural Economics, U. S. Department of Agriculture; economist with *Washington Herald.*

Arthur Richmond Marsh, A.B.: CONTROL OF FUTURES.
Editor, *The Economic World;* member, New York Cotton Exchange; President and Treasurer, The Chronicle Company.

Frederick H. Martens: MUSICIANS AND MUSICAL PERFORMANCES.
Writer on musical topics, Rutherford, New Jersey; Contributing Editor, *Art of Music.*

Thomas O. Marvin, B.D.: TARIFF COMMISSION.
Chairman, U. S. Tariff Commission.

Kirtly F. Mather, B.Sc., Ph.D.: DYNAMIC GEOLOGY; EARTHQUAKES.
Associate Professor of Physiography and Chairman of the Department of Geology and Geography, Harvard University; geologist, U. S. Geological Survey; fellow, Royal Geographical Society.

John M. Mathews, A.B., Ph.D.: STATE GOVERNMENT.
Professor of Political Science at University of Illinois; member, American Political Science Association, American Society of International Law.

W. D. Matthew, A.B., Ph.B., A.M., Ph.D.: VERTEBRATE PALEONTOLOGY.
Curator, American Museum of Natural History.

Howard Lee McBain, B.A., M.A., Ph.D.: FEDERAL JUDICIARY.
Eaton Professor of the Science of Government at Columbia University; Associate Editor, *National Municipal Review,* and *Political Science Quarterly.*

Frank McIntyre: TERRITORIES AND DEPENDENCIES.
Major General, U. S. A.; Chief, Bureau of Insular Affairs, War Department.

A. W. McKay: Farm Marketing.
Marketing Economist, Bureau of Agricultural Economics, U. S. Department of Agriculture.

Leila Mechlin, M.A.: Painting, Bibliography of Arts.
Secretary, American Federation of Arts; Editor, *The American Magazine of Art*; art critic, *Washington Evening Star.*

A. J. Miller, M.D.: Pathology.
Professor of Clinical Pathology at University of Nebraska Medical School.

George A. Miller, A.B., Ph.D.: Mathematics.
Professor of Mathematics at University of Illinois.

Gladys A. Mock: Art Sales and Exhibitions.
Of the American Federation of Arts.

W. A. Moffett: Naval Aëronautics.
Rear Admiral, U. S. N.: Chief, Bureau of Aëronautics, Navy Department.

John R. Mohler, V.M.D., D.Sc.: Diseases and Pests of Animals.
Chief, Bureau of Animal Industry, U. S. Department of Agriculture; member, Society of American Bacteriologists, American Veterinary Medical Association.

F. W. Mohlman, Ph.D.: Sanitary Chemistry.
Chief Chemist, Sanitary District of Chicago.

Parker T. Moon, B.Sc., Ph.D.: International Relations.
Professor of Political Science at Columbia University; Secretary and trustee of the Academy of Political Science in the City of New York; Managing Editor, *Political Science Quarterly.*

Joy Elmer Morgan, A.B., B.L.S.: Bibliography of Academic Education.
Editor, *National Journal of Education,* Washington.

Ruth Morgan: Women's Work for Peace.
Director, Research Division, National Education Association; Vice President, and Chairman of Department for International Coöperation to Prevent War, National League of Women Voters; member, Executive Committee, Foreign Policy Association.

Roland S. Morris, A.B., LL.B., LL.D.: European Affairs and America.
Member, American Bar Association, Pennsylvania Bar Association; Special Lecturer on International Law at University of Pennsylvania.

Denys P. Myers, A.B.: Influence of United States on World Affairs.
Corresponding Secretary and Librarian, World Peace Foundation; Editor, Source Materials, *Foreign Affairs.*

Walter Nelles: Freedom of Opinion.
Publicist: member of the New York Bar.

E. L. Newcomb, Ph.M., Ph.D.: ECONOMIC BOTANY.
Professor, School of Pharmacy, University of Minnesota; Editor, *Northwestern Druggist;* member, Committee of Revision of the Pharmacopœia of the United States of America.

Mabel Newcomer, Ph.D.: INCOME TAX.
Professor of Economics at Vassar College.

John K. Norton: PRIMARY AND GRADE SCHOOLS; STATISTICS OF EDUCATION.
Director, Research Division, National Education Association.

Howard W. Odum, A.B., A.M., Ph.D.: SOCIOLOGY.
Kenan Professor of Sociology, and Director of the School of Public Welfare, University of North Carolina.

H. M. Olmsted: MUNICIPAL OWNERSHIP.
Consulting Engineer-Accountant and Public Utility Rate Expert, New York.

A. Heath Onthank: BUSINESS STATISTICS.
Chief, Domestic Commerce Division, U. S. Department of Commerce.

William H. Park, A.B., M.D., LL.D.: BACTERIOLOGY.
Consulting Bacteriologist and Examiner in Bacteriology, Department of Health, New York.

H. C. Parmelee, B.Sc., A.M., D.Sc.: CHEMICAL ENGINEERING.
Editor, *Chemical and Metallurgical Engineering*, New York; member, American Institute of Chemical Engineers, American Chemical Society.

Thomas B. Paton: BANKING STATISTICS.
General Counsel, American Bankers Association.

Rudolph Pintner, M.A., Ph.D.: MENTAL TESTS.
Professor of Education at Teachers College, Columbia University; member, American Psychological Association.

L. B. Porterfield: NAVAL RECRUITING.
Captain, U. S. N.; Bureau of Navigation, Navy Department.

George K. Pratt, M.D.: MENTAL HYGIENE.
Assistant Medical Director, National Committee of Mental Hygiene.

M. M. Proffitt: VOCATIONAL EDUCATION.
Specialist in Industrial Education, U. S. Bureau of Education.

Harold S. Quigley, A.B., Ph.D.: ORIENTAL RELATIONS OF AMERICA.
Professor of Political Science at University of Minnesota.

John J. Quigley, A.B., A.M.: PRICE FIXING.
Columbia University.

Lewis Radcliffe: FISHERIES.
Acting Commissioner, Bureau of Fisheries, U. S. Department of Commerce.

W. H. Rastall: Engineering and Construction Statistics.
Chief, Industrial Machinery Division, Bureau of Foreign and Domestic Commerce, U. S. Department of Commerce.

A. Duncan Reid: Automobile Liability Insurance.
President, Globe Indemnity Company, Newark.

Calvin W. Rice, S.B.: Mechanical Engineering.
Member, American Society of Mechanical Engineers; fellow, American Institute of Electrical Engineers; member, Institute of Electrical Engineers (London); honorary member, Koninklijk Instituut van Ingenieure.

Stuart A. Rice, Ph.D.: Sociology Applied to History and Government.
Professor of Sociology at Dartmouth College.

Bernard G. Richards: The Jewish Church.
Executive Secretary, American Jewish Congress.

Theodore G. Risley, B.Sc., LL.B.: Immigration; Deportation; Registry.
Solicitor of U. S. Department of Labor.

David A. Robertson: Exchanges of Teachers and Students with Foreign Countries.
Assistant Director, American Council of Education.

R. S. Robertson: Armaments.
Lieutenant, U. S. N.; Historical Section, Navy Department.

Frederick B. Robinson, A.B., A.M., Ph.D.: Colleges and Universities.
Dean of the School of Business and Civic Administration, Director of the Evening Sessions, College of the City of New York.

Louis N. Robinson, A.B., Ph.D.: Movements to Check Crime.
Russell Sage Foundation; member, American Institute of Criminal Law and Criminology, American Economics Association, American Statistical Association.

W. L. Rodgers: The Navy.
Rear Admiral, U. S. N.; member, American Philosophical Society.

Lindsay Rogers, A.B., Ph.D., LL.B.: Governmental Development in America and Abroad.
Associate Professor of Government at Columbia University; associate editor of *Political Science Quarterly*, and of *American Political Science Review*.

John C. Rolfe, A.B., A.M., Ph.D.: Ancient Literature and Philology—Latin.
Professor of Latin Languages and Literature at University of Pennsylvania; member, American Philological Association.

Edward F. Rowse: American History.
Head, Manuscripts and History Section, New York State Library.

R. E. Saleski, Ph.D.: Modern Languages.
Professor at University of Delaware.

Herbert W. Schneider, Ph.D.: PHILOSOPHY.
Professor at Columbia University; assistant editor, *Journal of Philosophy.*

William M. Schuyler: THE INSTITUTE OF POLITICS.
Editor, Institute of Politics Bureau of Records, 1925.

Winfield Scott: PENSIONS.
Commissioner of Pensions, U. S. Department of the Interior.

James Lee Sellers, Ph.D.: POLITICAL PERSONALITIES.
Assistant Professor of History at University of Wisconsin.

William R. Shands: BLUE SKY LAWS.
Director, Securities Division, Virginia State Corporation Commission.

E. W. Sheets, B.Sc., M.S.: DAIRYING AND LIVESTOCK.
Chief, Animal Husbandry Division, Bureau of Animal Industry, U. S. Department of Agriculture.

Herbert N. Shenton, Ph.B., M.A., B.D.: SOCIAL WORK OF RELIGIOUS ORGANIZATIONS.
Instructor in Sociology at Columbia University; member, Executive Committee, Methodist Federation for Social Service, American Academy of Political and Social Science.

E. H. H. Simmons: CONTROL OF STOCK AND OTHER EXCHANGES.
President, New York Stock Exchange.

Francis S. Sisson, A.B., LL.D.: PUBLIC DEBTS; LOANS TO ALLIES.
Vice President, Guaranty Trust Company of New York; member, American Economic Association, Academy of Political Science.

R. O. Small: BIBLIOGRAPHY OF VOCATIONAL EDUCATION.
Director, Massachusetts Board for Vocational Education.

George Otis Smith, A.B., A.M., Ph.D., D.Sc.: FEDERAL GEOLOGICAL SURVEYS.
Director, U. S. Geological Survey, Department of the Interior.

George Soule, A.B.: LABOR CONDITIONS.
Director of Labor Bureau, Inc.; member, Editorial Staff, *The New Republic;* member, American Academy of Political and Social Science, American Association for Labor Legislation.

J. Duncan Spaeth, A.B., Ph.D., Litt.D.: AMERICAN LITERATURE.
Professor of English at Princeton University; member, Modern Language Association, American Dialect Association, American Academy of Social and Political Science.

William Spry: PUBLIC LANDS.
Commissioner, General Land Office, U. S. Department of the Interior.

Percy G. Stiles, M.D.: PHYSIOLOGY.
Professor of Physiology at Harvard Medical School.

O. C. Stine, Ph.B., Ph.D.: AGRICULTURAL STATISTICS.
In charge, Division of Statistical and Historical Research, Bureau of Agricultural Economics, U. S. Department of Agriculture.

Carl W. Stocks: MOTOR BUS SERVICE.
Editor, *Bus Transportation*, New York.

Benjamin Stolberg: BOLSHEVISM.
Journalist and Publicist, New York.

Wendell M. Strong, B.A., M.A., LL.B.: LIFE INSURANCE; ACCIDENT, HEALTH, AND LIABILITY INSURANCE.
Associate Actuary, Mutual Life Insurance Company.

Graham H. Stuart, Ph.D.: LATIN-AMERICAN RELATIONS.
Professor of Political Science at Stanford University.

James Swan: NAVAL ARCHITECTURE; MARINE ENGINEERING.
Editor, *Marine Engineering and Shipping Age*, New York.

Virginia Tanner: PAGEANTS.
Pageant Manager, Cambridge, Massachusetts.

Harry Taylor: WATERWAYS AND HARBORS.
Major General, U. S. A.; Chief of Engineers, War Department.

Hugh S. Taylor, Ph.D.: INORGANIC AND PHYSICAL CHEMISTRY.
Professor of Physical Chemistry at Princeton University.

William A. Taylor, B.S., D.Sc.: HORTICULTURE.
Chief, Bureau of Plant Industry, U. S. Department of Agriculture; member, American Society for the Promotion of Agricultural Science, American Pomological Society.

Aubrey Tealdi, Ph.D.: LANDSCAPE ARCHITECTURE.
Professor of Landscape Design at University of Michigan.

Walter M. Thayer, Jr., M.D.: DEFECTIVE DELINQUENTS.
Superintendent, State Institution for Defective Delinquents, Napanock, New York.

Arthur W. Thomas, Ph.D.: BIOLOGICAL AND FOOD CHEMISTRY.
Associate Professor of Food Chemistry at Columbia University.

H. J. Van Cleave, Ph.D.: INVERTEBRATE ZOÖLOGY.
Professor of Zoölogy at University of Illinois; secretary, American Microscopical Society.

Burton M. Varney: METEOROLOGY AND CLIMATOLOGY.
Assistant Editor, Weather Bureau, U. S. Department of Agriculture.

August Vollmer: PREVENTION OF DELINQUENCY.
Chief of Police, Berkeley, California.

M. W. von Bernewitz: GOLD AND SILVER.
U. S. Bureau of Mines, Pittsburgh, Pennsylvania.

C. Laurence Warwick, B.Sc.: MATERIALS OF ENGINEERING.
Secretary-Treasurer, American Society for Testing Materials.

Maurine Watkins, A.B.: MOTION PICTURES; THE DRAMA.
Associate Editor with The Macmillan Company; member of The 47 Workshop; Motion Picture and Dramatic Critic.

Roger H. Wells, Ph.D.: STATE AND COUNTY GOVERNMENT.
Professor of Economics and Politics at Bryn Mawr College.

Ray B. Westerfield, B.A., M.A., Ph.D.: NATIONAL CURRENCY.
Professor of Political Economy at Yale University; member, American Economics Association.

James A. Wetmore, LL.B.: PUBLIC BUILDINGS.
Acting Supervising Architect, U. S. Treasury Department.

C. N. Weyl, Ph.D.: ELECTRICAL ENGINEERING.
Assistant Professor of Electrical Engineering at University of Pennsylvania.

C. H. Whitaker: ARCHITECTURE.
Editor, *The Journal of the American Institute of Architects.*

Charles P. White, A.M.: LICENSE TAXES; AUTOMOBILE TAXES.
Instructor in Economics at University of Pennsylvania.

Herbert T. Whitlock, C.E.: MINERALOGY AND PETROLOGY.
Curator of Mineralogy, American Museum of Natural History.

Frank C. Whitmore, A.B., A.M., Ph.D.: ORGANIC CHEMISTRY.
Professor of Organic Chemistry at Northwestern University; member, American Chemical Society, American Electrochemical Society, Deutsche Chemische Gesellschaft.

Francis G. Wickware, B.A., B.Sc.: BOOK PUBLISHING.
Editor with D. Appleton and Company, New York.

Delos F. Wilcox, A.B., A.M., Ph.D.: ELECTRIC LIGHTING AND POWER.
Public Utility Expert, Grand Rapids, Michigan; member, American Economics Association, American Political Science Association, Academy of Political Science.

Malcolm Willey, Ph.D.: SOCIOLOGY APPLIED TO HISTORY AND GOVERNMENT.
Professor of Sociology at Dartmouth College.

C. E. A. Winslow, B.Sc., M.S., A.M.: PUBLIC HEALTH AND HYGIENE.
Professor of Public Health at Yale University; member, American Public Health Association; Chairman, New York State Commission on Ventilation.

Clinton Rogers Woodruff, A.B., Ph.B., LL.B.: CIVIL SERVICE; MUNICIPAL GOVERNMENT.
Member of the Pennsylvania Bar; Honorary Secretary of National Municipal League; Editor, *National Municipal Review.*

John C. Wright, B.Sc., A.M.: VOCATIONAL EDUCATION.
Director, Federal Board for Vocational Education; member, National Society for Vocational Education, Society of Automotive Engineers.

A RECORD OF EVENTS AND PROGRESS

PART ONE
HISTORICAL

DIVISION I
AMERICAN POLITICAL HISTORY

THE UNITED STATES

By John A. Krout
Professor at Columbia University

A POLITICAL SURVEY

Elements of Policy.—A survey of the political history of the United States during 1925 indicates that the nation has been still struggling with important problems of readjustment caused by its participation in the World War. In Administration circles the "return to normalcy" policy, originally voiced by President Harding, remained the central point in the program of President Coolidge and his advisers. It was particularly noticeable in the vigorous campaign for economy, a campaign designed to relieve the taxpayer from the burden of abnormally high taxes and to strengthen business by curtailing wasteful expenditures.

In Congress the more or less fruitless efforts to find a legislative remedy for the ills of the farmer revealed the fact that agriculture was but slowly recovering from the depression following the war years. In the interest of what seemed to be a sound financial readjustment between nations the Government turned its attention to the settlement of the debts owed to us by European countries. National defense on land and sea received a more careful consideration than was normally the case before our entrance into the war in 1917. Though the American people had apparently decided that, as a nation, they would avoid European complications in the future, there were numerous indications of governmental concern over the ultimate political and economic settlement across the Atlantic.

While the campaign for American entrance into the League of Nations seemed to lose ground, a strong demand in both parties arose for the immediate participation of the United States in the benefits and responsibilities of the World Court. More than six years after the Armistice, then, the nation was still grappling with problems growing out of the greatest war in history. That some of the most perplexing of these questions were slowly being answered will appear in the following pages.

Presidential Election of 1924.—The political situation during 1925 was to a large extent determined by the result of the 1924 elections. The victory of the Republican Party at the polls, while not as overwhelming as in 1920, was rather greater than even its optimistic leaders expected. President Coolidge's popular Republican vote was 15,718,789, nearly fifty-five per cent. of the total vote cast; as Democratic candidate Davis polled 8,378,962; and Senator La Follette, the Progressive leader, received 4,822,319. The outstanding feature of the election was the relative strength of the Democratic and Progressive candidates in the trans-Mississippi west. In twelve states the Democratic vote was less than the La Follette vote, Mr. Davis securing only about 10 per cent. of the total. In certain sections of the country the so-called third party had become temporarily the real party of opposition. However, any theory that the Progressive Party would succeed to the place in American politics occupied by the Democratic Party was clearly challenged by the failure of Senator La Follette to carry the grain-growing states of the northwest, and by the solidity of the southern states in their Democratic allegiance. Lesser parties, which appeared sporadically on the ballots, failed to secure any widespread support. The Workers' Party, which is avowedly Communistic, and the Socialist Labor Party each polled less than 35,000 votes while the National Prohibition Party surpassed them with 48,000. The Commonwealth Land Party, devoted to the Single Tax, secured a negligible vote, less than 3,000.

Congressional Elections of 1924.—A more effective control of Congress was one of the fruits of victory for the Republicans. After the results of the Congressional contests were finally tabulated it appeared that losses had been suffered by both the Democrats and the La Follette Progressives. In the Senate, for example, the new alignment for 1925-
1927 indicated that there would
50 Republicans, 40 Democrats, 5
Follette Republicans and 1 Farme
Laborite. The membership in t
next House included 232 Republica
183 Democrats, 5 La Follette Repu
licans, 3 Farmer-Laborites and 2 S
cialists. For the Democratic Par
this represented a net loss of t
Senators and twenty-four Represe
tatives. The Farmer-Labor Par
lost one Senator in the defeat
Magnus Johnson of Minnesota, b
gained two members in the Hous
The Regular Republicans gained f
teen members in the House and thr
Senators.

From the statistics of the vote f
president and for members of Co
gress it was evident that the Dem
cratic Party had not recovered fro
its overwhelming defeat in 1920, a
that the forces of Progressivism h
not succeeded in uniting their vario
blocs into a compact minority part
Some publicists, indeed, raised t
question of whether the future o
position to the Republican Par
would be a system of blocs rath
than a national party.

**Democrats Taking Account
Stock.**—The serious situation of t
Democratic Party was quickly sens
by national leaders of prominen
who sought some means of heali
the wounds which had resulted fro
the battle between the supporters
Alfred E. Smith of New York a
William G. McAdoo of California
the 1924 nominating convention. T
Chairman of the National Commi
tee, Clem Shaver, of West Virgini
who had managed the Davis ca
paign, was criticized for his failu
to reconcile the hostile element
Certain eastern leaders, who believe
that the party organization shou
be more active between national ca
paigns, joined Franklin D. Roosev
of New York in advocating a gener
conference of party workers, simil
to a national convention, for the pu
pose of discussing ways and mea
of strengthening the party throug
out the country. Mr. Roosevelt's su
gestion received the hearty endors
ment of Senator Walsh of Monta
and Senator Robinson of Arkansa
and was approved by Chairma

Shaver of the National Committee. It was not welcomed, however, by the rank and file throughout the south and west and the proposed conference did not materialize.

Discussion of the reasons for the Democratic defeat even reached the halls of Congress where Senator Bruce of Maryland and Senator Harrison of Mississippi, both Democrats, expressed conflicting opinions. To Senator Bruce the cause of the trouble was the abandonment of the principles of Jefferson and Cleveland. He insisted that the party which had once stood firmly against the encroachment of the national government on the powers of the states was now eagerly surrendering the constitutional rights of the state and local governments to federal bureaus, boards and commissions. Senator Harrison doubted the truth of this diagnosis, but believed that the Democratic Party had erred greatly in forming temporary alliances in western states with the forces of the Progressives. Senator Walsh of Montana challenged the idea that there had been coöperation between Democrats and Progressives in his own state. His view of the situation was far more optimistic than that of the other Senators and he announced that time would remove many of the factors which served to divide the Party. However, to most impartial observers, there seemed to be slight indication that the bitterness of 1924 would disappear in the immediate future.

Progress of Governor Alfred Smith.—During the past year there has been little diminution in the rivalry between Governor Alfred E. Smith and William G. McAdoo for control of the party machinery. From southern and western states came word that "McAdoo for President" clubs had not entirely disappeared; and it was rumored that the supporters of the former Secretary of the Treasury were quietly making plans for the 1928 campaign. At the same time the power and prestige of Governor Smith in the party councils was considerably enhanced. His spectacular triumph in being reelected governor of New York in a year when President Coolidge carried the state by almost 870,000 kept him prominently before the nation. In a long drawn out contest with the Republican legislature over income tax reduction he won a brilliant personal victory by appealing to the people.

July 4, a number of eastern Democrats united in honoring him at the annual celebration of the Tammany Society. Governor Alfred C. Ritchie of Maryland delivered one of the principal addresses in which he referred to Governor Smith's probable future success in reaching the White House. A letter from Governor Silzer of New Jersey expressed the hope that New York's governor would one day be president of the United States.

The Democratic primaries in New York City strengthened Smith's leadership, because he successfully brought forward State Senator James J. Walker as the Tammany candidate against Mayor John F. Hylan. The Mayor was endorsed by the Brooklyn Democratic machine and by the "Hearst interests" in the city, but he failed to win the approval of Tammany, then under the direction of Judge Olvaney.

In September Governor Smith was invited to visit Chicago, where he addressed an enthusiastic gathering of nearly 100,000 Democrats—from Illinois and neighboring states. Many political writers regarded this as an early move toward securing the Democratic nomination for president in 1928. Certainly, it indicated that the organization in Chicago under the leadership of George Brennan favored the Governor's political ambitions.

Attitude of Democratic Leaders.—But the Chicago meeting cannot be taken as an indication of the attitude of Democrats throughout the west and south. In both of these sections there is widespread opposition to any suggestion that Governor Smith is the man to lead the party to a national victory. It is an opposition based on several important considerations. In the first place outside of the eastern states the policies and methods of Tammany Hall are regarded with great misgiving, if not downright disapproval. Combined with this is a religious prejudice—Governor Smith is a Roman Catholic—difficult to estimate, but none the less evident in the rural communities of the middle western and southern states. In addition, the apparent opposition to prohibition in the eastern states rapidly diminishes west of the Appalachians and south of the Mason and Dixon line. Perhaps, more fundamental, however, is the profound distrust with which western Democrats, since the days of the late William Jennings Bryan's first presidential campaign, have regarded eastern leadership in their party. Some who are interested in a workable compromise have suggested that harmony cannot be restored until a leader is found free from all connection with the recent factional fights. They have pointed with some hope to the achievement of Governor Donahey of Ohio, who was re-elected in 1924 by 175,000, though President Coolidge received a plurality of 700,000.

Political Attitude of Labor.—The forces which supported Senator La Follette for president have rapidly disintegrated. His following was composed of group combinations which could not be expected to hold together after the election. One of the most important of these groups was the American Federation of Labor. Its endorsement of the Progressive campaign in 1924 was a distinct break with its previous policy. President Gompers had always insisted that organized labor should refuse to join any political organization, as such, and should direct its political strength toward electing sympathetic public officials. Since the election the American Federation of Labor, under President Green, has returned to its earlier policy. August 2, the Executive Council announced that its course in the future would be strictly non-partisan in matters political. "The launching of third party movements," declared the Council, "has been proved wasted effort and injurious to the desire to elect candidates with favorable records." The Federation in convention assembled endorsed this sentiment with enthusiasm. To what exten this decision will affect the thir party movement in the United State remains to be seen, for the rank an file of the unions have never been inclined to accept the rule of thei leaders in politics.

Whether or not a similar nonpartisan policy will be sanctioned b the four great railroad brotherhood is a matter of conjecture. As th sponsors of the Conference for Progressive Political Action, thes brotherhoods carried much of th financial and administrative burde in the La Follette campaign. In th past they have been much more inclined than the American Federatio of Labor to look favorably on national third party movements; bu during the year they have not attempted to effect a permanent political organization. The Conference a Chicago on February 22, called t consider plans for a permanent thir party organization, indicated that th railroad brotherhoods were not read to commit themselves to a definit policy. After the representatives o the sixteen labor groups had le the convention, the remainder of th Conference for Progressive Politica Action and the Socialists held a second meeting at which it was decide to proceed with plans for an independent party. The national organizatio was to be based upon state group sympathetic with progressive policies. The Socialists under the leadership of Morris Hillquit oppose the plan on the ground that it woul exclude various organizations o laboring men from actual affiliatio with the movement. The Socialis protest, however, was voted down an the conference adjourned. As a result, the third party movement ha lost the official support of organize labor and was not assured that th Socialists would continue their polic of coöperation.

Political Status of the Socialists—In their desire for an immediat victory the Socialists cast in thei lot with the La Follette Progressive in 1924. It was obviously a temporary and unnatural alliance, for th disciples of Karl Marx could scarcel reconcile their doctrines with the re forming zeal of Robert M. La Follette. Since the election it has become evident that many Socialists regret the action of last year and regard further alliance with a third party as distinctly unwise. As a political group, however, the Socialist Party is far from a united organization. Factional fights, reflecting in part the split in the Socialist movement in Russia, have resulted in dissension within the ranks which threatens to nullify all previous achievements. The extremists, of course, have abandoned the Marxian doctrinaires for the radical Communist organization, the Workers' Party. It was this group that wrecked the Farmer-Labor Party in 1923 and attempted to control the St. Paul convention in 1924. Failing to secure support from agrarian and labor organizations it was left isolated and was compelled to conduct a separate presidential campaign.

Since the election two factions within the Socialist ranks have staged a struggle for control, each claiming to represent the Third International. The question at issue has been whether or not the Workers' Party should continue its efforts to form alliances with other political movements. A referendum vote was taken which sustained the group opposed to federating with other third party organizations. This result, however, was overruled by the instructions from Moscow which advised the party to coöperate with farmers and wage-earners whenever possible. Numerically the Workers' Party, whatever its policy, is insignificant. It has claimed as high as 100,000 members, but no credible figures have shown more than 25,000. An American delegate to Moscow in April, 1925, reported that the Workers' Party had only "20,000 members, of which 2,000 are in the English-speaking organizations." There is nothing to indicate that the Communist movement in the United States is growing.

Republican Political Policies.—From the standpoint of the Republican Party the most important elements in the Progressive movement were the agrarian groups of the northwestern states. Such support as Senator La Follette received in the northern section of the Mississippi Valley came largely from voters who were normally classed as Republicans. The organization leaders bent all their efforts toward winning back the discontented farmers as quickly as possible. Their task was made considerably easier by reason of President Coolidge's program of economy and his suggestions in regard to farm relief, which found favor in many of the regions controlled by the "insurgents." Furthermore the situation was profoundly affected by the death of Senator Robert Marion La Follette on June 18, and that of Senator Edwin F. Ladd four days later. The Progressive movement thus lost two of its ablest leaders; and there seemed to be no other leaders ready to take their place. Senator Norris of Nebraska declined to assume responsibility for the political policies of the "insurgents." The prospects of the regular Republicans for the preservation of their power visibly brightened. It seemed as if they might even break the grip of the Progressives on the state of Wisconsin.

Wisconsin Senatorial Election.—Therefore, it was with considerable hope of success that the Republican organization decided to try to elect its candidate to the United States Senate to fill the vacancy caused by the death of Senator La Follette. Senator Lenroot of Wisconsin strongly urged the contest and Chairman Butler of the Republican National Committee came to the assistance of the state forces. At the primary election Roy Wilcox was the organization candidate while Robert M. La Follette, Jr., the late Senator's son, represented the progressive wing of the party. Factional discord in the organization forces, complicated by mismanagement of the Wilcox campaign, was partly responsible for the decisive victory of the progressive group. Robert M. La Follette, Jr., thus became the Republican candidate. When the result was known the National Committee refused to interfere further in the contest. Edward F. Dithmar, former Lieutenant-Governor of the State, ran as an Independent, having assurances of support from Senator Lenroot and other prominent Republicans. Though he attempted to win votes by endorsing the Coolidge administration he was unable to unite the forces opposed to Progressivism. The election, on September 29, resulted in a victory for young La Follette, who was elected by a plurality of 140,000.

Suggestion of Coolidge for 1928.—In general the Republican Party felt confident of its power during the year. Prospects of success in the Congressional elections of 1926 were exceedingly good. On July 5 David W. Mulvane, national committeeman from Kansas, issued a statement in which he declared that President Coolidge should succeed himself. Since the statement was released to the press after its author had conferred with Everett Sanders, secretary to the President, it was assumed that the presidential campaign of 1928 had been formally opened. The President, Mr. Mulvane asserted, was serving his first term at the hands of the electorate, and the question of a third term was not relevant. In any event the third-term tradition was worthless when the people wanted a man to represent them. There were others who agreed with Mulvane regarding the next nominee of the Republican Party, for most political observers felt that President Coolidge was genuinely popular throughout the country and that his leadership and his policies were great assets to his party.

Ku Klux Klan in Politics.—The political influence of the Ku Klux Klan was the subject of considerable conjecture during the year, but no evidence of great value could be obtained because of the secret methods of the organization. In the state and local elections on November 3 there were isolated results which indicated that in some communities the Klan was fighting more in the open than heretofore. The mayoralty campaign in Detroit became a struggle between Klan and anti-Klan forces during the closing weeks and the election of John W. Smith as mayor was regarded as a defeat for those who accepted the principles of the K Klux organization. Four of the fiv candidates for the city council, however, were elected apparently wit the support of the Klan. In Louisville, Kentucky, the contest for mayo was abruptly terminated by the withdrawal of the Democratic candidat shortly before the election, after h had admitted that at one time he wa a member of the Klan. Many newspaper correspondents who followe the election results carefully were inclined to believe that the vote in November, 1925, in general revealed distinct decline in religious and racia prejudice, but there were others wh felt that the politicians would soo be dealing with more or less definite groups willing to support organizations similar to the Ku Klu Klan.

New Jersey Election.—In tw states the result of the Novembe 1925, balloting was anything but encouraging to the Republicans. Afte a bitter fight A. Harry Moore of Jersey City was elected governor of Ne Jersey on the Democratic ticke Though he had the united suppor of the Democratic machine and popular issue in his "wet" program his victory was partly owing to th dissensions within the Republica organization. Some attempt had bee made to interest President Coolidg in the campaign, but he refused t interfere on behalf of his party. I New York State the Republican Stat Committee undertook a campaig against several proposed amendment to the state constitution, all of whic had been passed by a legislature i which the Republicans had a workin majority.

New York Election.—Governo Smith entered upon a speaking tou in support of the amendments an profited greatly from the inability the Republican leaders to agree o a definite policy of opposition. Th fact that all four amendments wer ratified by the voters seemed to ind cate that the Republican organizatio was suffering from internal dissensions. For Governor Smith it wa one part of a double victory. On th same day the Tammany candidate fo mayor of New York, James J

Walker, was elected by a plurality exceeding 400,000. Inasmuch as the nomination of Mr. Walker had been dictated by Governor Smith, the result of the election was interpreted as a victory for the Governor. There was widespread speculation in political circles when Mayor-elect Walker announced that he would take a short vacation in the South. Some purported to see in his visit to the southern states an attempt to win favor for Tammany Hall and its leaders among southern Democrats. This idea seemed to be somewhat confirmed by the cordial reception which Mr. Walker received in Atlanta, where a number of Georgia politicians assembled to honor him. The year closed with both parties looking forward hopefully to the Congressional elections of 1926.

PERIOD FROM DECEMBER, 1924, TO MARCH, 1925

By John A. Krout
Professor at Columbia University

Lame Ducks.—The second session of the sixty-eighth Congress which opened in December, 1924, was destined to be a duplication of many previous short sessions. A number of the members of both the Senate and House of Representatives had sought reëlection in 1924 and failed. Under our clumsy method of electing members long in advance of their terms of office, however, the final session of every Congress is held after the country has chosen the members who are to take their seats in the new Congress. As a result most final sessions are not productive of legislation in strict accord with the latest expression of the preferences of the electorate. There is also a tendency on the part of the legislator to mark time.

Senate Changes.—In the Senate an important change in membership occurred. Senator Henry Cabot Lodge of Massachusetts, who had represented his state for thirty-one years, died on November 9, and in accordance with the law of Massachusetts Governor Cox appointed and selected to fill the vacancy till 1927 William M. Butler. Since Mr. Butler was a personal friend of President Coolidge and had managed the Republican presidential campaign, he became the President's confidant and spokesman in the Senate. His appointment established much closer relations between the White House and the Capitol which were mutually beneficial.

The important post of Republican leader in the Senate, so long held by Senator Lodge, was assigned to Senator Charles Curtis, who had seen considerable service in the Republican ranks. The chairmanship of the Committee on Foreign Relations, regarded by some as the most coveted position in the Senate, fell to Senator Borah of Idaho under the seniority rule. This change was of considerable consequence in its bearing upon the relations between the Committee and the State Department in respect of foreign relations.

On December 16 Professor Hiram Bingham, formerly a member of the faculty at Yale, was elected to the Senate to succeed the late Senator Brandegee of Connecticut. At the time of his election Professor Bingham was governor-elect of the state. He was inaugurated on January 7, filled the office of governor for twenty-four hours and then went to Washington to take his seat in the Senate.

President's Message.—On the second day of the session President Coolidge sent to the two houses a preliminary message devoted to the subject of economy and the reduction of taxation. On the basis of the Treasury figures regarding the year's income and expenditure, he predicted a surplus of nearly $68,000,000. His annual message, sent to Congress in writing, was couched in phrases consistent with his program of economy. He recommended that wherever possible appropriations be decreased and the tax burden be diminished. He called attention to the fact that during the previous session no definite action had been taken in regard to American participation in the Permanent Court of International Justice, and recorded his opinion, in the matter of debts owed to the United States by foreign governments, that it was "for the best welfare of the world that they should be liquidated and paid as fast as possible." Special reference was made to the President's interest in the negro race and his hope that they would be freed from all forms of oppression and coercion. Concerning transportation the President spoke strongly in favor of consolidation through the grouping of the smaller railroads into a few large systems. He recommended relief for the farmer, but felt that action should await the report from the agricultural commission which was then investigating the situation. In a previous message he had urged the sale of Muscle Shoals, but he evaded the issue this time by advising that if no proper offer were made for lease or purchase, "the development should continue and the plant should be dedicated primarily to the production of materials for the fertilization of the soil."

Muscle Shoals.—Two of the points stressed by the President in his message occasioned considerable controversy in the House and Senate. Proposals in regard to Muscle Shoals were part of the business which remained unfinished at the close of the previous session. The measure championed by Senator Underwood and known as the Underwood Bill, which provided for leasing the waterpower rights to a private corporation, had the approval of President Coolidge. In fact, certain newspapers published stories charging that Senator Underwood had resorted to secret communications with the White House in the attempt to have the bill adopted, but the Senate by unanimous vote on December 19 held that the criticisms were unwarranted. Opposition to the Underwood proposition rallied to the support of a bill introduced by Senator Norris of Nebraska for the development of power at Muscle Shoals through the management of the plant by federal authorities. The issue had apparently become one of the proper
methods of regulating and operatin
a public utility.

No Legislation.—During the pr
longed debate a fundamental diffe
ence in purpose between the suppor
ers of the two measures became mo
evident. The friends of the Norr
bill believed that the power proje
should be carried forward by the go
ernment in order to manufacture n
trates both for fertilization and fo
war materials. Their opponents we
particularly interested in Musc
Shoals because of the possibility o
furnishing electric power to indu
trial establishments within a radiu
of several hundred miles. After pra
tically every phase of the matter ha
been debated the Senate on Januar
14 adopted the Underwood bill by
vote of 52 to 30. Two weeks later th
House passed the bill in an amende
form by 181 votes to 41. The confe
ence committee attempted to reconci
differences and announced that it ha
reached an agreement on February
Although almost a month of the se
sion still remained and the Presider
undoubtedly desired action, a dete
mined minority prevented a final d
cision and the bill remained with th
unfinished business when Congress ad
journed.

Agricultural Proposals.—The pend
ing legislation for agricultural r
lief occupied much of the time of bot
houses and was closely watched b
President Coolidge. During the pr
vious session three proposals ha
failed to win the support of the legi
lators. The Norbeck-Burtness Bill t
loan fifty-eight million dollars t
spring-wheat farmers to enable the
to abandon the one-crop system
though it had support from the Whit
House, was defeated in the Senat
Likewise the McNary-Haugen Bil
which proposed the creation of a far
export corporation capitalized at tw
hundred million dollars to mark
surplus wheat overseas, failed to pa
the House. The measure was spo
sored by the National Live Stock Pr
ducers' Association, the America
Wheat Growers' Association and th
National Milk Producers' Associatio
The Norris-Sinclair Bill to provid
for the purchase and sale of agricu
tural products through government

agencies was reported to the Senate but never considered.

Agricultural Commission. — With such an embarrassment of riches in the form of legislative remedies many Congressmen were waiting for the report of the unofficial Agricultural Commission which had been studying the situation. On January 27, at one of the famous breakfast conferences, President Coolidge went over the question with members of the agricultural committees of both houses, and a day later sent to Congress with his endorsement a lengthy report drawn up by the agricultural commission. The main features of the report, remarkably similar to recommendations previously made by the President, proposed that new facilities be provided for borrowing money from the government through a new farm credit corporation and that a Federal Coöperative Marketing Board, consisting of the Secretary of Agriculture, Secretary of Commerce and three others chosen by agricultural organizations, be created. The commission also advised the legalization of farmers' associations and pools for the sale of their products, and the establishment of coöperative market organizations and clearing houses. In spite of the fact that this definite program had the support of the Administration, Congress failed to take action in the closing days of the session.

Unfinished Business.—Besides the legislation just discussed several other measures were lost in the tumult and confusion of an expiring Congress. The bills which seemed likely to pass, but finally remained in the unfinished business were a bill to permit national banks to establish branches, a general pension bill to bring a degree of order into the existing pension system, the much needed bill to codify the federal statutes and a bill for retiring government employees.

Salary Act. — More successful was the proposal to increase the salaries of members of Congress, which had been changed only once since 1873. As finally passed, the act raised the salaries of Vice-President, the Speaker of the House and members of the cabinet from $12,000 to $15,000, and of members of Congress from $7,500 to $10,000. The measure was passed in both houses without the formality of a roll-call and considerable criticism of the action was voiced in the press. Certain Democratic editors insisted that the President would have to veto the bill as in conflict with his economy program, but this was not the decision at the White House.

The Postal Bill, carrying an increase in the salary scale for postal employees and an increase in postal rates, was signed by President Coolidge just before his first term expired.

Status of Third Party Men.—During the session there had been much talk concerning the action which the organization would take to punish those nominal Republicans who supported the La Follette and Wheeler ticket in 1924. No invitations to the caucus of Republican members of the House were sent to thirteen representatives who were elected in 1922 as Republicans. The list of those who had supported the third party included Sinclair of North Dakota, Keller of Minnesota, La Guardia of New York and Cooper, Voight, Nelson, Schacht, Lampert, Beck, Browne, Schneider, Frear and Peavey from Wisconsin. It was understood that Representative Longworth of Ohio spoke with the approval of President Coolidge when he said: "The insurgents have read themselves out of the party." But the "insurgents" registered a vigorous protest against the action and through Frear of Wisconsin, their spokesman, insisted that they belonged within the Republican ranks. Representative La Guardia of New York went so far as to give a warning to the party leaders that his influence might be needed in his own state.

In the Senate, despite the opposition of Senator Borah, the "regulars" served notice that the "insurgents" would be treated in the apportionment of committee memberships for the sixty-ninth Congress as if they were members of a minor party. In the House the Republicans started a new precedent by holding an advance caucus to nominate their candidate for Speaker in the next Congress. Although the friends of Martin B. Madden of Illinois were active in his behalf, Nicholas Longworth of Ohio, son-in-law of the late President Theodore Roosevelt, was easily nominated by a vote of 160 to 89.

Record of the Congress.—The sixty-eighth Congress expired at noon on March 4, 1925, with a record which left many important matters unsettled. Like many of its predecessors, it passed on to the next Congress a heavy burden of legislative problems. During the two years of its sessions appropriation bills amounting to $7,898,000,000 were passed, and Republican leaders felt that the total had been kept down by effective attempts at economy. As an indication of the work of the legislators the statute books contained 993 additional public and private bills. Most of the legislation of consequence, however, had been enacted during the first session.

EXTRA SESSION OF 1925

By John A. Krout

Professor at Columbia University

Vice President's Début.—In order to secure the ratification of important appointments the President called an extra session of the Senate on March 4. Vice-President Dawes on being inducted as presiding officer of the Senate took advantage of the occasion to deliver an address filled with sharp criticism of the rules and procedure of the body over which he was to preside. His attack was directed chiefly against the leisurely character of senatorial debate, which offered every inducement to the minority to filibuster and prevented a majority from bringing important matters to a final vote.

The public was greatly surprised and interested by the Vice-President's charges, but the Senate was temporarily in an angry mood. There were suggestions that the body should find some means of disciplining its presiding officer, but calmer counsel quickly prevailed. In place of Senator Cummins of Iowa, who retired, Senator Moses of New Hampshire was chosen President of the Senate pro tem.

Cabinet Nominations.—Most of the two-weeks' session was taken up with a controversy over the appointment of an Attorney-General. On March 5 President Coolidge sent in the renomination of Postmaster-General Harry S. New for the four-year term. This was necessary because the present law fixes the term of the Postmaster-General at four years. The appointment was immediately confirmed.

Warren Episode.—The same ready compliance of the Senate was not evident when the President nominated Charles Beecher Warren of Michigan to be Attorney-General. When the nomination came up for confirmation in the Senate on March 10 there was a tie vote, 40 to 40. Had Vice-President Dawes been presiding at the time, he could have broken the deadlock by his vote in support of the President's appointment. In his absence the Administration leaders attempted to break the tie, whereupon Senator Overman of North Carolina, the only Democrat who had voted for confirmation, changed his vote and the Senate refused by 41 to 39 to reconsider its action. President Coolidge decided to force the issue and resubmitted Mr. Warren's name, but the Senate stood firm and rejected it again on March 16 by a vote of 46 to 40.

From the viewpoint of the White House matters had become serious. Not since President Johnson's bitter and disastrous war with Congress between 1866 and 1868 had the nomination of a cabinet officer been rejected. For more than fifty years the right of the President to name his cabinet advisers without Senatorial interference had been a precedent so uniformly respected as to have almost the effect of a part of the constitutional system.

To President Coolidge the rejection of his appointment meant far more than the failure to have Mr. Warren in his cabinet. But the Senate insisted that it enjoyed a right, specifically granted in the Constitution, to scrutinize even cabinet appointments. In the present instance it saw fit to object to Mr. Warren's activities while forming the so-called Sugar Trust. When the President announced his intention of making a recess appointment, it looked as if the country was in for a long drawn out battle between presidential prerogative and senatorial power.

Appointment of Sargent.—March 17, however, the name of John G. Sargent of Vermont was sent in and unanimously confirmed as Attorney-General. Though the constitutional issue had been evaded, it had not been settled. For the time being the President had given ground before the attack of the Senate. It seemed more than likely that the question would be raised in the new Congress.

Rules of the Senate.—Following the adjournment of the special session of the Senate, Vice-President Dawes announced that he would attempt to force a modification of Senate rules by presenting the case to the country. He spoke frequently during the recess in all parts of the nation, urging the voters to bring pressure to bear on their representatives in the Senate. His chief argument against the existing rules was that a majority could not close the debate on any bill and bring it to a vote. He also emphasized the fact that in the case of all measures considered under unanimous consent one member could prevent the enactment of legislation. The Vice-President's appeal was favorably received in many localities, but it aroused no great enthusiasm on the part of the electorate. Its effect upon the members of the Senate was even less favorable to an amending of the rules, for many Senators resented Mr. Dawes' efforts to bring political pressure to bear upon them.

Controversy Over Cloture.—The opponents of the idea of majority cloture came from several groups. In the first place, Southern senators regarded the proposed changes as hostile to their interests because they had learned to rely upon unlimited debate in the Senate to defeat legislation similar to the Force bill and the anti-lynching bills. Another group in favor of the *status quo* was the progressive element, which found that threats of a filibuster were effective in securing concessions from the majority party. Finally, a large number of regular Republicans were convinced that the slow deliberation of the Senate had saved the country from many legislative fads that might otherwise have become laws.

These enemies of the Dawes proposals admitted that the privileges of unlimited debate were often abused, but they denied that the remedy lay in conferring upon a majority the right to close all debate. They pointed out that in 1917 the Senate had adopted a cloture rule which gave two-thirds of the members the right to close debate after proper notice. This rule, they asserted, had seldom been used, but it was always available in the event of a prolonged filibuster. As Congress convened in December, it seemed evident that any change in the Senate rules would be long postponed.

FIRST SESSION OF 69TH CONGRESS

By John A. Krout
Professor at Columbia University

Line-up of the Senate.—As the time drew near for the opening of the first regular session of the 69th Congress, December, 1925, the Administration leaders began to appraise the political line-up in the House and Senate. The task of Senator Curtis of Kansas, Republican floor leader in the Senate, was not as easy as it appeared. On paper the Republicans in the upper house numbered fifty-six, seven more than the forty-nine votes required for a majority. Several of these senators, however, were nominal rather than regular supporters of the party's policies. Senator Curtis could scarcely count on consistent support for Administration measures from Senators Borah of Idaho, Couzens of Michigan, Brookhart of Iowa, Frazier and Nye of North Dakota, La Follette of Wisconsin, and Norris of Nebraska, not to mention Norbeck and McMaster of South Dakota.

With such an array of possible "independents" it was discreet for the Administration Republicans to adopt a policy of conciliation. Senators Brookhart and Frazier had been excluded from the party caucus at the last session and were, therefore, regarded as definitely rejected. In the case of Robert M. La Follette, Jr., who had been elected to succeed his father, and of Gerald P. Nye, who had been appointed by Governor Sorlie to succeed the late Senator Ladd, the Administration leaders were inclined to be lenient. There was some doubt as to the right of Mr. Nye to take his seat by appointment of the governor, because North Dakota, following the adoption of the constitutional amendment providing for the direct election of United States Senators, failed to enact a law empowering the governor to fill a senatorial vacancy by appointment. Accordingly, when the Senate convened, Mr. Nye's credentials were immediately referred to the Committee on Privileges and Elections.

Young La Follette Issue.—Whether or not Senator La Follette should be regarded as a Republican, and given committee assignments as a member of the majority party, caused considerable controversy. The Committee on Committees was at first deadlocked over the matter. Of the Republicans, Senators Smoot of Utah, Watson of Indiana, Ernst of Kentucky, and Cameron of Arizona believed that La Follette should be denied committee assignments, while Senators Moses of New Hampshire, Wadsworth of New York, Reed of Pennsylvania, and McNary of Oregon favored a more lenient policy. Though Senator La Follette announced that his course in the Senate would be determined by the principles and policies formerly championed by his father, the Republica organization finally decided to assig him as a Republican to the Senat committees. There was no questio of regularity in the case of the othe new members of the Senate who ha been chosen since the special sessio in March. Senator Robinson of Indiana took the place of the late Senator Ralston, and Senator William of Missouri succeeded the late Senator Spencer.

House Insurgents.—In handling th insurgents the majority party in th House of Representatives was not inclined to be conciliatory. Representative Longworth, the Republican nominee for Speaker, announced tha every Republican who desired regula committee assignments would have to pass two tests. These tests were first, his willingness to vote for the caucus nominee for Speaker; and second, his willingness to rescind the rule discharging a committee of custody of a bill by a vote of 150 members, and to substitute the old rule requiring a majority. When the House organized on December 17, Mr Longworth was easily elected Speaker defeating the Democratic candidate Finis J. Garrett of Tennessee, by a vote of 229 to 173. But thirteen insurgents and independents supported Henry A. Cooper of Wisconsin. The same group resisted the House majority when it voted to require 218 members to force a committee to report a bill for consideration and debate. As a result of their refusal to meet the tests of Republicanism, the insurgents were disciplined by the Committee on Committees. A dozen nominal Republicans, who had supported Representative Cooper, were removed from their places on important committees and placed at the foot of the Republican list on minor committees. The Administration forces were thus prepared to enact their legislative program with little opposition from the Democrats or from dissenters within their own ranks. Speaker Longworth had given conclusive evidence of his control over his party in the House.

President's Annual Message.—On December 8 President Coolidge sent his written message to Congress. It contained no startling recommendations, for the President reiterated and summarized many of his previous statements to the press. The more important domestic issues discussed in the message included taxation, the coal strike, the merchant marine, air defense and the disposal of Muscle Shoals. Congress was urged to accept the measure drafted by the House Committee on Ways and Means as an admirable revenue law for 1926. In the absence of proper legislation the Administration was prevented from interfering in the coal strike. Congress should authorize the President and the Departments of Commerce and Labor to appoint temporary boards empowered to conduct investigations, to encourage arbitration, and in the event of a coal shortage to exercise control over distribution. Development of the merchant marine, according to the message, required centralized executive control in the management of the operating lines and in the sale of surplus ships. It was essential that Congress take action to prevent mismanagement through a division of councils. In connection with air defense the President was glad to forward the report of his special board of investigation, which indicated that no radical change in the organization of the service was necessary. It seemed to the President that the problem of Muscle Shoals had been greatly overemphasized. He advised Congress to return the property to private management that it might be developed for the production of nitrates and incidentally for power purposes.

Foreign Relations in the Message.—In the field of foreign relations the message stressed the desirability of further international disarmament, but contained a word of caution against a too great willingness to participate in European conferences for that purpose. The foreign-debt settlements, negotiated during the year by the War Debt Commission, were hopeful signs and worthy of immediate ratification. Again, a plea for the World Court was made, on the ground that it was an admirable instrumentality for the realization of world peace.

The proposed reservations under which the United States should ratify the statute creating the tribunal were definitely stated. They included: first, the assumption of no obligation under the Covenant of the League of Nations; second, equal participation with European nations in the election of judges; third, Congressional determination of the American share of expenses; fourth, consent of the United States to any amendment of the statute creating the Court; and fifth, freedom from obligation to accept advisory opinions of the Court given without American consent. On these terms President Coolidge based his plea that the United States join the nations already supporting the Permanent Court of International Justice.

Budget.—The President's annual message was followed by his budget recommendations. He declared that the outlook for the fiscal year 1926-1927 was exceedingly favorable, since ordinary receipts were estimated at $3,824,530,203 and expenditures at $3,494,222,308, which would mean a surplus of more than $330,307,890. Of special significance was his statement that, while the efforts for economy would continue, the minimum cost of running the government had been reached, and the normal expansion of a growing nation would call for added expenditures from year to year. The President announced that the public debt of the nation had been reduced since 1919 by $6,080,507,760, its total on June 30, 1925, being $20,596,701,648.

New Tax Bill.—As soon as the House of Representatives completed the work of organization, Chairman Green of the Ways and Means Committee, introduced the new revenue bill. It had the support of every member of the committee which drafted it, except Representative Rainey of Illinois and Representative Hull of Tennessee, both Democrats. Representative Garner of Texas, ranking Democrat on the Ways and Means Committee, had agreed that the measure should be regarded as bi-partisan. The new bill differed from the existing law in several important particulars. The maximum surtax on incomes was reduced from 40 to 20 per cent. on incomes above $150,000. The schedule of normal rates was also scaled down, starting with 1½ per cent. on the first $4,000 of income, 3 per cent. on the next $4,000, and 5 per cent. on the remainder. Personal exemptions were increased from $1,000 to $1,500 for a single person and from $2,500 to $3,500 for the head of a family. The clause in the revenue act of 1925, providing for publicity of income tax returns, was omitted. In the sections dealing with estate taxes the maximum rate of surtax was reduced from 40 to 20 per cent., and a provision was inserted allowing credit for as much as 80 per cent. on the federal tax because of payment of an estate tax to the state. The gift tax, originally designed to prevent evasion of the estate tax, was eliminated. The tax on the automotive industry was removed with the exception of a 3 per cent. levy against passenger cars, which represented a reduction from 5 per cent. The entertainment and theater taxes were retained with the exception of the elimination of the tax on "legitimate drama." Great reductions were made in the rates on tobacco, cigars and alcohol, and most of the other sales taxes were dropped. In order to expedite appeals of taxpayers a Board of Tax Appeals was created with sixteen members appointed for life.

The Tax Bill Rushed.—The speed with which the House handled the revenue measure was phenomenal. Five days were allowed for general debate and then the various provisions were considered under a rule limiting speeches to five minutes. Comparatively little opposition to the measure developed, most of the Democrats uniting with the Republicans to pass the sections of the bill as they had come from the committee. Delegations from ten states signed a protest to the President and Congress against the estate-tax provisions which, they said, forced every state to exact an estate tax patterned after the federal act in order to keep within the state at least 80 per cent. of the total levied by the federal government. But the lobbying efforts of the states, which imposed no inheritance tax, failed to win a majority the legislators, and the House a proved the 20 per cent. estate tax a 2 to 1 vote.

Amendments.—Equally futile we the attempts of Representative L Guardia of New York to keep t publicity of income tax returns, a of Representative Frear of Wisco sin to continue the gift tax with rat equal to the inheritance levies. Mr Mary Norton of New Jersey also su fered defeat when she tried to mak the income tax exemptions $3,000 fo a single person and $5,000 for a family head. In only two important pa ticulars did the House agree to amen the original proposals. On the fin day of consideration it was agree that the tax on commercial alcoh should be increased. The Republican avoided a sharp fight against th Board of Tax Appeals by striking ou the provision, giving members a lif tenure of office, which was oppose by Democratic leaders, and by fixin the terms at from 4 to 14 years. O December 18, after nine days of debate, the House of Representative passed the amended revenue bill by vote of 390 to 25. It was estimate that the measure would reduce taxe by $325,736,000. The Senate Committee on Finance was scheduled to consider the bill on January 2.

Proposals on Prohibition Legislation.—While the House made unusual progress with the revenue measure, the Senate considered a variet of matters. Senators Edge and Edwards of New Jersey on the secon day of the session introduced measures designed to amend the Volstea Act. Senator Edge proposed that 2.7 beer be legalized and that physician be allowed to write prescriptions calling for more than one pint of liquo per person every ten days. The bill introduced by Senator Edwards provided for the repeal of the Volstea Act and the substitution of an ac legalizing the sale in original packages of beer having 4 per cent. of alcohol by weight. These proposals wer referred to the Judiciary Committee but they furnished the occasion for verbal duel between the "wet" an "dry" forces. Senator Bruce of Maryland, supported by Senators King o

Utah and Edge of New Jersey, charged that prohibitory legislation had been the most efficient incubator of crime in the history of the country. He denounced the existing condition of prohibition enforcement as a disgrace of which the nation should immediately rid itself by abandoning attempts to enforce an "absolutely unenforceable law." The defense of prohibition was presented by Senators Willis of Ohio, Sheppard of Texas, and McKellar of Tennessee.

Borah's Foreign Bills.—Senator Borah, Chairman of the Committee on Foreign Relations, indicated that he was willing to oppose the Administration when he introduced several measures which did not represent the views of President Coolidge. One of the bills provided for the recognition of the Soviet government of Russia by the United States. Another sought to repeal the act of 1920 against the admission of aliens under which Secretary Kellogg had refused to admit Countess Karolyi to this country. The third measure was intended to afford a means through the courts for the restoration of alien property seized by the Alien Property Custodian under his wartime powers.

Debt Settlements.—A storm of opposition arose in the Senate on December 16 when Senator Smoot of Utah, Chairman of the Finance Committee and a member of the War Debt Commission, sought to secure imediate consideration of the debt settlements negotiated during the recess. The Italian settlement, which contained terms more favorable than those granted to other countries, was the center of the attack led by Senators Borah, Johnson, Norris and Reed of Missouri. Senators Smoot and Lenroot defended the debt agreements as representing in each case the maximum that the debtor country could be expected to pay. Senator Reed charged that the Italian agreement and possibly others were nothing but "whitewashed repudiation." Coming as it did on the eve of the day set for the formal debate on the World Court, the spirited opposition to the debt settlements seemed to be an attempt to revive old prejudices hostile to any coöperation with European nations. At the same time a constitutional point was raised in the House of Representatives where it was claimed that the Senate could not take up the debt agreements until after the House had acted. Because of this technicality, there was little likelihood of an early ratification of the financial settlements.

World Court Proposals.—According to the resolution adopted during the special session of the Senate in March, debate on the World Court proposal was scheduled for December 17. On that date Senator Swanson of Virginia, ranking Democrat of the Foreign Relations Committee, spoke in favor of a resolution to ratify the statute creating the tribunal, with the reservation suggested by President Coolidge. He was supported by Senators Lenroot and Walsh, who agreed that the Court was not dependent for its personnel or jurisdiction upon the League of Nations, in spite of the fact that the Assembly and Council of the League were used as administrative instrumentalities. Senator Borah, the leading spokesman for the World Court opponents, reiterated his previous objections to the immediate adherence of the United States to the Court, urging the necessity for a codification of international law outlawing war. The course of the discussion indicated that fear of the League of Nations still remained the greatest obstacle in the way of American participation with European nations in the work of the Permanent Court of International Justice.

EVENTS IN THE DEPARTMENTS

By John A. Krout

Professor at Columbia University

Besides the formulation of the war-debt agreements and the campaign for better enforcement of national prohibition, which are discussed in other sections of this article, the chief developments in the Treasury Department related to the program of tax reduction. On May 3 statistics were published by the Department showing that tax receipts for the first nine months of the fiscal year 1925 amounted to more than $1,928,982,000, only $217,821,000 less than for the same period in 1924. The figures indicated that further tax reduction would be possible and Secretary Mellon cautiously outlined his ideas of revision. He urged the abolition of the federal inheritance tax as one of the first steps in a constructive program. He was also in favor of as great a reduction as possible in the rates of surtaxes applied to incomes. When the Treasury report for the fiscal year 1924-1925 showed a surplus of $250,000,000, ardent advocates of tax reduction wanted the amount applied in determining the rates for the new revenue bill. Secretary Mellon, however, indicated that the surplus had already been used to decrease the amount of the debt, which had been reduced by $735,000,000 during the year.

The actual work of formulating the provisions of the new internal revenue bill was begun at Washington on October 19. Public hearings before the Ways and Means Committee of the House of Representatives continued until November 3. Secretary Mellon presented the proposals of the Treasury Department designed to effect further relief for the tax-payers of the nation. The principal points in his recommendations included the repeal of the federal estate tax, the tax on automobile trucks, tires and accessories, and the tax on gifts. The effect of tax-exempt securities on federal taxation was clearly stated and a constitutional amendment to abolish such exemption was strongly urged. Secretary Mellon also advised Congress to repeal the publicity section of the existing revenue law on the ground that it was "utterly useless from a Treasury standpoint." In the matter of taxes on incomes the Secretary was explicit in his suggestions of new rates. Instead of the present surtax of 40 per cent. on incomes of $200,000 or more, he advocated a maximum surtax of 20 p cent. on incomes over $150,000. H schedule of normal rates provided f 1½ per cent. instead of 2 per cent. incomes up to $4,000, 3 per cent. i stead of 4 per cent. on incomes fro $4,000 to $8,000, and 5 per cent. i stead of 6 per cent. on incomes ov $8,000. To the suggestion that i comes of $5,000 or less should exempt from federal taxation, Secr tary Mellon was distinctly oppose He declared that such exemptio would deprive the government $167,000,000 of revenue and "wou be wrong in policy and ineffective decreasing the cost of collection or eliminating delay and congestion "As a matter of policy," he sai "nothing so brings home to a man t feeling that he personally has an i terest in seeing that Government re enues are not squandered, but inte ligently expended, as the fact that l contributes individually a dire tax, no matter how small to h Government." These views were co siderably modified by the Committe on Ways and Means in the revenu bill submitted to Congress in D cember.

Department of Interior.—The A ministration's program of tax redu tion was made possible, in large par by the saving in administration ex penses of the several executive d partments. In the Department of th Interior, for example, the decrease i the cost of administration for the tw year period from July 1, 1923, t June 30, 1925, amounted to $82.635 930. During the past year the var ous bureaus in the department oper ated with 2,013 fewer permanent em ployees than in 1923, with an aver age annual wage saving of more tha $3,700,000. All of the bureaus wer reorganized by a corps of experts in terested in securing maximum effi ciency and economy. The force in th General Land Office was considerabl reduced, the local land offices wer consolidated, and a dozen surveyors general were retired from the publi service. In addition, the Bureau o Mines, the Mineral Resources Divi sion of the Geological Survey, as wel as the Patent Office, were transferre to the Department of Commerce du ing the fiscal year 1925 by executive order.

Secretary Work manifested particular interest in the problem of oil conservation and the changing policy of the government toward reclamation projects. On December 18, 1924, President Coolidge, at the suggestion of the Secretary of the Interior, appointed a Federal Oil Conservation Board, composed of the Secretaries of War, Interior, Agriculture and Commerce, to investigate the oil resources of the country. It was possible for the Board to secure the coöperation of a committee of experts from the American Petroleum Institute. After an exhaustive survey of the situation was made the committee submitted a detailed report on August 26 which contained estimates of the petroleum reserves readily available. According to the committee's statistics, the crude oil recoverable by present methods would provide 5,300,000,000 barrels, and there would then remain 26,000,000,000 barrels to be recovered by improved processes. An additional source of supply existed in the 4,000,000 acres of oil shale in the public domain, from which possibly 60,000,000,000 barrels could be extracted, if prices warranted the higher cost of its development. The Interior Department announced that up to June 30 there were 422 outstanding leases on oil and gas lands made under authority granted by the general leasing law of 1920.

Secretary Work, in his annual report and public utterances, indicated that he was primarily interested in re-shaping the governmental policy of reclamation. Though a representative of that section of the country which generally urges large appropriations for reclamation projects, he seriously questioned the advisability of carrying forward certain irrigation works in regions where the land was not sufficiently productive to attract qualified settlers. He strongly recommended that the country use the vast areas of arable lands it now has before pouring millions of dollars into watering dry places. In this policy he believed that he had the support of many in the agrarian sections of the trans-Mississippi west. "There is a widespread opposition," he said, "to the opening up, by the Government of additional acres of agricultural land at this time. Charges are made that overproduction of agricultural products will be increased and present prices reduced. This opposition is not confined to the middle states which fear competition from the virile west, but is voiced also by farm organizations in irrigated districts, which protest against local competition from increased acreage. . . . It must be shown that new projects will not entail a loss to the reclamation fund, otherwise farmers outside of irrigation projects will have to compete with subsidised agriculture."

Furthermore, Secretary Work protested against a system which made it extremely difficult to collect from the water-users the sums owing to the government. It cost $2,107,000 to operate and maintain the irrigation works during 1925 and of this sum $959,744 remained unpaid at the end of the fiscal year. The uncollected charges for five years were $8,500,000.

Department of Agriculture.—While Secretary Work was dealing with unwise reclamation projects, the Department of Agriculture was studying the plight of the farmers in the great grain-producing states. Although Secretary Jardine recognized the farmer's difficulty in marketing surplus crops at a price above the cost of production, he agreed with President Coolidge in resisting any remedy resembling a subsidy to agriculture. His solution of the problem involved nothing more drastic than an increase in intensive, scientific farming and creation of coöperative farmers' associations. In fact, the Department of Agriculture was inclined to believe that the agricultural situation was improving, since the farmers had received a gross income of $12,136,000,000 for the year ended June 30. This was the largest return since 1921 and represented an increase of 7.5 per cent. over the previous year. A conference of farm organizations at Washington under the auspices of the Department of Agriculture formulated a measure for the establishment within the Department of a Division of Coöperative Marketing. The new bureau, as announced by Secretary Jardine on October 31, was not to have powers of regulation, but was limited to expert advice. The bill evidently foreshadowed President Coolidge's own policy.

Secretary Jardine ordered an investigation into the wide fluctuations in the quotations of wheat which occurred during March. As a result of the probe, the Chicago Board of Trade was instructed to use administrative devices to prevent future manipulations. On September 14 the Department of Agriculture approved the merger of the Armour and Morris packing companies which had been effected in 1922. Though there had been opposition to the merger on the part of the government, Secretary Jardine ruled that the amalgamation did not result in price-fixing, monopoly, or unreasonable restraint of trade within the meaning of the Clayton Anti-Trust Law or the Packers Stockyard Act. Arguments of the counsel for Armour & Co. convinced the Secretary that the merger had effected a saving and that the new company controlled less than 25 per cent. of the packing business of the nation.

Department of Commerce.—Secretary of Commerce Hoover was frequently called upon to serve on committees or administrative commissions dealing with problems outside the regular routine of his department. As a member of the World War Debt Commission he served with Secretaries Mellon and Kellogg; in the work of the Federal Oil Conservation Commission he was assisted by Secretaries Weeks, Work and Jardine. The chief problems before the Secretary of Commerce, however, were those dealing with the development of commercial aviation, the regulation of radio broadcasting stations, and the curbing of foreign monopolistic control of raw materials. In coöperation with the American Engineering Council the Department of Commerce organized the Hoover Committee on Civil Aviation, which began its investigation of the commercial aircraft situation in June. Two months later Secretary Hoover announced that he was convinced of the desirability of a Bureau of Air Navigation to be placed under the jurisdiction of the Department of Commerce and given power to create a government inspection service for commercial airplanes. On November 5 the Committee on Civil Aviation made public its report, which recommended the enactment by Congress of a civil aëronautic law to be the basis of a definite government program regarding the industrial uses of aircraft. It was hoped that an additional bureau would enable the government to coöperate efficiently with business agencies in pushing forward the aircraft industry. When the fourth National Radio Conference met at Washington on November 9, Secretary Hoover presented the case in favor of federal control of radio communication. Though he believed that the national government should have adequate power to deal with the problem of interference, he desired to leave in the hands of local communities authority to decide who should use broadcasting stations. He believed that this would not result in a division of responsibility detrimental to successful radio transmission. Acting on his suggestions the annual conference drafted a comprehensive outline of desirable congressional legislation. Secretary Hoover announced that no new broadcasting stations would be licensed by the Department of Commerce until Congress had indicated what action it intended to take.

Perhaps the most significant pronouncement bearing upon commercial affairs was Secretary Hoover's warning to European nations against production and price controls of important raw materials which the United States must purchase abroad. He charged that these combinations had been set up either directly by legislation of foreign governments or indirectly by governmental patronage. They affected the production as well as the price of such materials as rubber, silk, nitrates, tin, dyestuffs, quinine and coffee, for which we annually spend four-fifths of a billion dollars. These controls, Mr.

Hoover maintained, were created for the purpose of increasing price levels through limiting production and were most successful where one nation possessed a practical monopoly of the supply of certain raw materials. In discussing the reprisals which the United States might use, he said: "We could resolutely set ourselves to reduce consumption in every article that is so controlled. We could stimulate the use and manufacture of substitutes. We could induce our citizens to go abroad to other regions and establish rival production. We could prohibit the extension of credit to countries where such controls are maintained. We could request the rest of the consuming world to join with us in these campaigns. But this is trade war, and we want to live in trade peace. . . . I am convinced that the sound solution does not lie in any of the alternatives I have outlined; they are all in the nature of last resorts. I believe the solution does lie in the willingness of statesmen throughout the world to recognize the consequences of government-controlled production and price, and to meet the issue in the only way it should be met, that is, by abandonment of all such governmental action."

Department of Labor.—Problems connected with the operation of the Immigration Act of 1924 continued to receive special attention from officials in the Department of Labor. The presence in the United States of many aliens not legally entitled to reside here was the subject of frequent statements issued by Secretary Davis. Speaking to the convention of the Brotherhood of Railway Trainmen in Cleveland, Ohio, on May 16, he emphasized the evil of unregulated immigration from Mexico. His information on the subject caused him to believe that there was wholesale smuggling of aliens, particularly orientals, across our southwestern boundary. Although it was obviously impossible under the existing system to determine how extensively the immigration laws were being violated, Secretary Davis estimated that a million aliens were illegally within the country. To remedy the situation he proposed that Congress enact a law providing for an annual registration of all aliens, similar to the act which failed to receive support in the Sixty-eighth Congress. W. W. Husband, Commissioner General of Immigration, also tried to arouse public interest in the enforcement of the immigration laws. He charged that the process of smuggling foreigners into the United States was so well perfected that thousands continually waited their turn in Cuba and the price for bringing in Chinese had been fixed at $700. Secretary Davis indicated that he would demand action from Congress at its next session.

Although the immigration law of 1924 was apparently operating to the satisfaction of government officials, attempts were made to perfect the administrative machinery. The Department of Labor desired to establish a system of examination in European countries which would sift out obvious undesirables before permission was granted to start for America. Under the law every immigrant was required to have on his passport the visa of an American consul, but the consular approval was based solely on general information and involved no examination. The Department's plan to institute preliminary examinations was put into effect at the United States Consulate in London on August 6. On that day it was announced that all persons desiring to emigrate from Great Britain to the United States would be given a physical and mental examination before sailing. It was hoped that the new system, if it proved successful, would be extended to other nations and would lighten the task of immigration examiners in this country.

The figures compiled by the Department of Labor showed that net immigration under the act of 1924 was 69 per cent. less during the fiscal year ending June 30, 1925, than during the preceding year. Total number of arrivals was listed as 294,314, while the total number of departures of aliens was 92,726. In the case of Italy, the number returning was far in excess of the number of immigrants, since only 6,203 Italians arrived, but 27,151 departed for their native land. Not all of the European nations filled their quotas during the year. Great Britain, Germany, Czechoslovakia and the Irish Free State did not send as many as 2 per cent. of the number of their nationals resident in this country in 1890.

PRESIDENTIAL POLICY

By Arthur N. Holcombe
Professor at Harvard University

President Coolidge's Inaugural.—President Calvin Coolidge's first elective term began on March 4, 1925. His inaugural address, which was broadcasted throughout the country, contained a general statement of governmental policy. Dealing first with foreign relations, he declared that the United States should "continue to be distinctively American," and should maintain "such a military force as comports the dignity and security of a great people." He favored, however, further disarmament by international agreement, and advocated adherence to the Permanent Court of International Justice, but insisted that the United States should not become "implicated in the political controversies of the Old World."

In domestic affairs he endorsed the principle of government by political parties, and entered a plea for harmonious coöperation between "those who are elected under the same party designation." He interpreted the recent presidential election as an expression of popular confidence in the American judiciary and of opposition to government ownership of railroads. He demanded further economy in public expenditures with a view to further tax reduction, "not because I wish to save money, but because I wish to save people." He cited the "helpful influences of restrictive immigration and the protective tariff," and declared strongly for "the first rule for the guidance of a citizen, his obedience to law." He denounced all attempts to apply any religious test to the holding of office, and closed with an assertion of American idealism which "seeks no earthly empire built on blood and force; . . . the higher state to which (America) seeks the allegiance of mankind is not of human but of divine origin."

Presidential Addresses.—Throughout the year the President continued his practice of giving regular interviews to representatives of the press, at which informal answers were furnished to questions relating to the policy of the Administration. From time to time he set forth his views more systematically in public addresses for which suitable occasions were chosen. Thus on Memorial Day, speaking at Arlington Cemetery, he made a strong appeal for better law enforcement and decried the tendency of local communities to shift their public responsibilities to the central government. "What we need," he declared, "is not more federal government but better local government." June 2, he spoke at the graduation exercises of the Naval Academy at Annapolis, and declared that "to promote peace on earth we must . . . call into action the spiritual and moral forces of mankind." June 8, he spoke at St. Paul, Minnesota, during the celebration of the centennial anniversary of the beginning of Norwegian immigration to the United States, and on July 3 at Cambridge, Massachusetts, where he delivered the address at the celebration of the 150th anniversary of Washington's taking over command of the Continental Army. He there warned the European Powers that American participation in the financial reconstruction of Europe would be contingent upon the pacific settlement of European controversies by the Europeans themselves.

From June 23 to September 9 the President stayed at White Court, Swampscott, Massachusetts. October 6, he addressed the annual convention of the American Legion at Omaha, Nebraska, making a strong plea for religious and racial tolerance among all classes of Americans, and December 7 he spoke before the national convention of the American Farm Bureau Federation at Chicago, setting forth his agricultural program. The following day his annual message to the Congress was read, while he remained at the White House, thus reviving the practice which was initiated by Thomas Jefferson and terminated by Woodrow Wilson.

Message of December 21, 1925.—The President's message strongly recommended adherence by the United States to the Permanent Court of International Justice, and in general endorsed the policies which he had brought forward in previous messages. Beginning with a survey of the state of the Union, he dwelt with proper pride upon the abounding prosperity and, while advocating further reduction of taxes, pointed out that the reduction of governmental expenses had gone about as far as it could. He advocated a rapid discharge of the public debt, and efficient development of public works, such as the Muscle Shoals and Colorado River projects, without involving the Federal Government directly in business operations. He opposed any radical reorganization of the military and naval establishment, but favored further encouragement of air navigation. He called attention to the possibility that the registration of aliens in the country may become necessary in order to prevent violation of the immigration laws; and pointed out the failure of the coal industry to adopt modern methods for the adjustment of labor disputes.

Foreign.—He expressed the hope that the nations of Europe would find a way to reduce their land armaments and suggested that such action would facilitate a further reduction of naval armaments, adding that the American government was willing to call another conference for the limitation of naval armaments, when feasible. He emphasized the importance of law enforcement, especially of the prohibition law. Calling attention to the improvement in the condition of agriculture, he pointed out the complexity of agricultural problems; and while opposing any system of governmental price-fixing, direct or indirect, he favored the further development of coöperative marketing.

Railroads. — His recommendations with reference to the railroads were less definite. He recommended that Congress authorize consolidations under the supervision of the Interstate Commerce Commission, but said nothing about compulsory consolidation or a time limit for voluntary consolidation. He recommended that the government fleet be managed by a single head, endorsed the work of the Federal Trade Commission, and advocated the extension of the civil service system to include all postmasters, collectors of internal revenue, and prohibition agents. He also advocated the enactment of the pending bill for the reorganization of the government departments. Other matters were considered more briefly.

Vice-President's Drive.—The Vice-President, Charles G. Dawes, who was inaugurated on March 4, took advantage of the occasion to urge upon the Senate a reform of its rules of procedure. He believed that a majority of the Senate ought always to be master of its own proceedings and recommended such changes in the rules as would enable the majority to prevent the obstruction of business by a minority and to terminate so-called filibustering. His suggestions were not well received by the Senate and he appealed to the country later, making a series of public addresses in all sections throughout the period when the Senate was adjourned.

THE PRESIDENT'S VIEWS

By John A. Krout
Professor at Columbia University

During the opening months of the year President Coolidge continued to stress the policies which he had done so much to popularize before the presidential election. The problem which received much of his attention and the one with which he had become most closely associated in the popular mind was economy.

General Views on Taxation.—A natural corollary of his program of thrift in expenditures was the possibility of further tax reduction. On both these matters the President had strong support throughout the country. Speaking in Washington on January 27 he indulged in some mathematical calculations in connection with the receipts and expenses of the national government. He believed that, besides the financial requirements of the national debt, not more than $3,000,000,000 should be spent in the fiscal year 1925-1926. If the revenues came up to the estimates he hoped that the same year would show a surplus of more than $370,000,000. Further retrenchment was possible and desirable, he felt, if the number of federal employees was reduced to conform to the real requirements of the federal civil service.

The President took up the question of national and state taxation in an address delivered on February 20 before the National Conference on Inheritance and Estate Taxation. He denounced the inheritance tax in no uncertain terms. When applied by both state and nation, it constituted an unreasonable burden in the form of double taxation and when freed from this objection it was still a form of socialism in the guise of revenue legislation. On the latter point the President was emphatic: "If we are to adopt socialism," he said, "it should be presented to the people of the country as socialism, and not under the guise of a law to collect revenue. The people are able to determine for themselves the desirability of a particular public policy and do not ask to have such policies forced upon them by indirection." In most cases the existing rates imposed on estates seemed to him to be confiscatory.

The Inaugural.—March 4, 1925, at his inauguration as President in his own right, President Coolidge had an opportunity to present an example of the economy which he had been advocating by precept. The inaugural ceremonies, following the precedent set by the late President Harding, were as simple as seemed consistent with the dignity of a great nation. No elaborate military parade followed the President from the White House to the Capitol and no expensive ball brought the day's ceremony to a close. The inaugural address broadcast to millions of Americans throughout the land contained a reaffirmation of the President's faith.

Taxation.—In the course of his discussion of the cost of government, he said: "I favor the policy of economy not because I wish to save money, but because I wish to save people. The men and women of this country who toil are the ones who bear the cost of government. Economy is idealism in its most practical form." As an outcome of this practical form of idealism tax reduction would result. Specifically, this tax reform ought to repeal outright the federal inheritance tax and reduce materially the existing rates of the income tax. Few paragraphs in the inaugural so clearly indicated the President's purpose and program as those dealing with financial matters.

Other Issues.—On other domestic issues his pronouncements were less definite. He demanded responsible party government with those "elected under the same party designation" maintaining harmony and coöperating in the formulation of a legislative program. The election, he asserted, had been a vote of confidence in the judiciary and a clear repudiation of the principle of public ownership of railroads and other public utilities. He referred in passing to the "helpful influences of restrictive immigration and a protective tariff." There was no indication, however, of whether he expected any change in the immigration and tariff laws. His emphatic declarations in regard to "obedience to law" were regarded as a veiled attack upon the violations of the nation's liquor laws. With this he combined a spirited plea for religious toleration denouncing "any inquisition either within or without the law to apply any religious test to the holding of office."

Foreign.—As the basis of a foreign policy the President urged the nation to continue to be "distinctly American," a statement which he later amplified by a word of caution against becoming involved in the political controversies of the Old World. After carefully outlining the effects of the World War upon the United States he suggested that in the interests of security and peace there were two decisions which it seemed desirable for the nation to make in the immediate future. One was to coöperate in further disarmament through international conference and agreement, and the other was to assume our place with the supporters of the Permanent Court of International Justice.

Neither in a disarmament conference nor in adherence to the World Court did he believe there was any danger of failing to maintain "our position of political detachment and independence." In conclusion he disclaimed for America any desire for foreign domination or an "earthly empire built on blood and force."

Developments subsequent to March 4 proved that President Coolidge was chiefly interested in tax reduction, limitation of armaments and American participation in the work of the World Court. On all of these questions he sought to lead the opinion of the country to the point where definite action would have the support of the great majority of American citizens. His plans were patiently formulated, but he did not lose sight of his ultimate purpose.

ECONOMY

Budget. — May 6, White House spokesmen announced that the President was determined to reduce the budget for the next fiscal year by at least $300,000,000. Economies in the executive departments, independent bureaus and commissions had been ordered, which would pave the way for a considerable decrease in tax schedules. From the Treasury Department came encouraging estimates which indicated that the surplus at the end of the fiscal year, June 30, would be in excess of $100,000,000. The President used this report to urge the administrative officers responsible for the compilation of the budget estimates to keep expenditures for 1926-1927 below $3,000,000,000. Under the direction of Herbert M. Lord, Director of the Bureau of the Budget, experts were determining when it would be possible to curtail the appropriations asked by the various departments.

Criticisms.—In the meantime the program of governmental economy, though it seemed to have the endorsement of a large majority in the country, was attacked by several groups. Visitors to the White House during the month of April warned the President that business was in danger of being adversely affected by the campaign against unnecessary expenditures. Former Governor Henry J. Allen of Kansas reported that business was being injured by too much talk of thrift and that a buyers' strike seemed to be developing. From another quarter there came appeals against the reduction of appropriations for the army and navy. Organizations interested in the maintenance of an adequate national defense complained that the nation's defensive strength was apt to be permanently weakened as the result of a too zealous devotion to a policy of retrenchment.

With these protests President Coolidge apparently had little sympathy, for he continued to stress both governmental and individual thrift in his speeches and interviews with the press. May 29, a proposal came from the White House for a survey by military experts to determine whether the regular army could be reduced from 118,000 to 111,000 men. The Administration spokesmen pointed out that such a reduction would mean an annual saving of $25,000,000, but they preferred to forego the financial retrenchment, if the military establishment would be seriously weakened.

Tax Reduction Plan.—June 22, the evening before he left Washington for his summer residence at Swampscott, Massachusetts, President Coolidge delivered his annual address to the assembly of administrative officers charged with preparing the budget for the coming fiscal year. The occasion gave him an opportunity to recount the accomplishments of the government in its economy program, and to pledge himself once more to tax reduction. In speaking of achievements he pointed out the fact that during four years of the operation of the budget system $2,081,000,000 had been saved through a decrease in appropriations and more than $3,400,000,000 of the national debt had been paid. He believed that these achievements would be duplicated in the future, but one important obstacle stood in the way of further economy. It was the legislation "under which the Federal Government hands out contributions to the States." He deplored the tendency of the states to turn to the national government for aid in projects where the state government ought to assume the responsibility.

In a few sentences he answered the charge that the economy program was hurting business. "Economy in the cost of government," he stated, "is inseparable from reduction in taxes. I have been unable to determine how reduction in taxes is injurious to business. . . . There can be no interruption in this effort for constructive economy in the federal business." He assured the country that there would be a considerable downward revision of taxes by the next Congress.

SUMMER CONFERENCES

During July and August the President was frequently in conference with Congressional leaders. It was evident from press reports of these interviews that the Administration was particularly concerned with the type of legislation which would bring the most desirable form of tax reduction. The political aspect of the situation was presented to the President by Senator Charles Curtis of Kansas and by Representative John O. Tilson of Connecticut, Republican floor leader in the House of Representatives. These leaders were confident that Congress would effect a reduction in the income tax prior to March 15, 1926, the date on which all income tax returns must be in the hands of government officials. Though it was well known that in both House and Senate there would be a contest over the changing of the rates, most of the Administration advisers urged a reduction to apply to incomes for 1925. On September 4 the President announced that he expected prompt action from Congress on the subject of the income tax, but he failed to indicate whether he had decided as to the details of a new tax measure.

LIMITATION OF ARMAMENTS

Proposed International Conference.—Financial matters were not the sole concern of President Coolidge during his stay in Massachusetts. As early as February 19 he had informed the press correspondents that he was strongly in favor of another international conference on the limitation of armaments to carry forward the work begun by the Washington Conference of 1921. Such a conference, he believed, should deal primarily with auxiliary ships and other craft not specifically mentioned in the Washington treaties. In order to ascertain foreign sentiment in the matter our ambassadors at Paris, London, Rome and Tokio had entered into diplomatic conversations with the governments to which they were accredited.

Delay.—In his inaugural address the President mentioned his plans and on March 25, after a conference with Senator Borah, Chairman of the Senate Committee on Foreign Relations, he indicated that formal invitations might be sent to the Powers most vitally interested. In the meantime, however, developments in Europe caused the Administration to delay action. In view of the projected conference on disarmament under the auspices of the League of Nations it seemed unwise to issue formal invitations for a meeting in Washington until the nature of the League's proposals was clear.

Though the President's plans were indefinitely postponed, he did not allow the matter to rest. Frequently, in his meetings with the representatives of the press he stressed the importance of relieving all nations from the burden of excessive armaments. On September 22 he issued a definite statement in which he announced his decision to submit to Congress the question of whether or not the United States should take the lead in a plan of general disarmament.

General Consolidation. — A domestic problem which claimed much of the President's time during the summer and autumn was transportation. On August 3 in one of his customary talks to the newspaper correspondents he expressed his interest in a general consolidation of railroads as a means of relieving the transportation and solving the rate problem. He believed that the absorption of non-paying lines in large unified systems would make possible rate adjustments which would not enrich one road at the expense of another. In line with his opposition to excessive governmental interference with business interests he hoped that such consolidations would be effected voluntarily by the roads without any further legislation from Congress.

Compulsory Consolidation.—Somewhat later in the month he discussed with Senator Watson of Indiana the question of compulsory consolidation. In the President's opinion the railroads, while opposed to compulsory groupings of lines, would take the initiative in consolidations under the supervisory direction of the Interstate Commerce Commission. Though he admitted that the delay of the Interstate Commerce Commission in the matter of the proposed Van Sweringen merger of the Nickel Plate lines was holding back other proposals, he was confident that unifications similar to those worked out by the Missouri Pacific and the Southern Pacific would be suggested by the railroad executives. Senator Watson was inclined to give the roads from five to seven years in which to effect voluntary consolidations with the option of compulsory groupings thereafter. The President reserved his definitive recommendations for his annual message to Congress in December.

AGRICULTURE

Freight Rates.—One element in the Administration's interest in the railroad problem was its bearing upon the agricultural situation throughout the country. Equitable readjustments of freight rates were regarded by President Coolidge as primary factors in aiding the farmers to market their crops at a reasonable profit. Although Congress had adjourned in March without enacting any legislative relief, the President believed that some governmental aid would be necessary.

Hands Off.—As he studied agricultural conditions during the summer, however, he came to the conclusion that the less the government interfered the better off the farmer would be. His pronounced opposition to paternalism, combined with his observation of improved conditions in the grain-growing states, persuaded him to proceed cautiously in advocating any possible changes in legislative policy.

Question of Guaranty.—This conservative note was dominant in his address to the national convention of the American Farm Bureau Federation at Chicago on December 7. He denounced all proposals, including those in the McNary-Haugen Bill which failed to pass the Sixty-eighth Congress, to organize corporations through which the government would engage in buying or selling farm products. Of price-fixing by the government, whether done directly or indirectly, he said: "This would be a dangerous undertaking, and, as the emergency is not so acute, it seems at present to have lost much of its support. The moment the government engages in buying and selling, by that act it is fixing prices. Ultimately it would end the independence which the farmers of this country enjoy. It would apparently destroy cooperative associations and all other marketing machinery, for no one can compete with the government. . . . To have agriculture worth anything it must rest on an independent business basis. It cannot at the same time be part private business and part government business."

PROTECTIVE TARIFF

With considerable vigor the President defended the protective tariff against the attacks of those who claim that the rates are unfavorable to the farmer. He contended that 88 per cent. of American imports are "free, or luxuries, or protected to help the farmer," leaving only 12 per cent. of our imports on which the agricultural industry pays any part of the tariff. In addition, the tariff confers a benefit upon the farmer by supplying him with a home market largely made possible through the development of our protected industries.

With the tariff as an aid to agriculture the President linked the farm loan and intermediate credit banks. Through these agencies more than $1,200,000,000 has been advanced to 350,000 farmers in all parts of the country.

But the greatest hope for the future, he believed, lay in an intelligent development of the coöperative movement. With economic information furnished by the Department of Agriculture, with better warehouse and storage facilities and with a better credit structure much could be done to take care of the farmer's marketing problem. The government's duty was to assist the farmers to promote their own welfare through coöperative marketing. This solution met with the approval of many farm organizations in the East, but it was a disappointment to members of the Farm Bureau in the middle west and northwest, where the problem of surplus crops is most acute.

In his annual message on December 8 (elsewhere discussed in this volume) the President adhered closely to the policies which he had announced from time to time during the year.

EVENTS IN FEDERAL ADMINISTRATIVE COMMISSIONS

By John A. Krout

Professor at Columbia University

In General.—A problem of considerable importance arose during the year as a result of President Coolidge's effort to bring the Federal Trade Commission and the Shipping Board into line with his policies. When Congress created the Federal Trade Commission in 1914 and the Shipping Board in 1916, it gave them semi-judicial powers as well as administrative duties. In the case of the Shipping Board, for example, the members were to form a quasi-judicial body for the purpose of regulating ocean freight rates, but within a year the management of the Emergency Fleet Corporation, an administrative task, was assigned to the Board. Controversies in 1925 raised the question of the extent to which such boards and commissions possessing functions not purely administrative were subject to executive control. President Coolidge apparently took the position that Congress did not intend to place either the Shipping Board or the Federal Trade Commission in the category of government agencies beyond the jurisdiction of the chief executive.

Trade Commission. — In April President Coolidge filled a vacancy on the Federal Trade Commission by appointing ex-Representative William E. Humphrey of Washington, who was one of the western managers of the President's campaign for renomination in 1924. The appointment caused a political controversy, the Democrats, who were now in the minority, insisting that Congress had intended to keep the Commission bipartisan. When the majority proceeded to modify the rules, the minority charged that the Commission had come completely under the dominance of the President. The new rules provided that the details of complaints filed should not be made public until proved and that, if firms consented to abandon their alleged methods of unfair competition, the charges against them should be automatically dropped. Because of the division of opinion within the Commission, the trouble was given full publicity in the press, resulting in much adverse criticism. Leaders in the Senate were aroused because a Senate resolution, requesting an investigation of certain business practices, had been referred to the Attorney-General for a ruling on the legality of the Senate's request. Senators George W. Norris of Nebraska and William E. Borah of Idaho were convinced that the Commission no longer served any useful purpose, while Senator William M. Butler called its members "Federal Paul Prys" who did more harm than good. Secretary of Commerce Hoover, however, dealt with the real problem when he questioned the wisdom of combining semi-judicial and semi-legislative with strictly administrative functions. He favored a separation of the former from the latter, with administrative functions entrusted to the ordinary executive officers. President Coolidge let it be known that he was opposed to the abolition of the Commission and regarded it as an important governmental agency.

Those who expected a radical change in the policy of the Federal Trade Commission toward mergers and consolidations were surprised that the Commission on August 7 voted to order the International Shoe Company of St. Louis to dispose of its stock holdings in the McElwain Company of Boston within sixty days. The purchase of a controlling interest in the New England concern by the St. Louis firm constituted a violation of the Clayton act, since it eliminated from competition the largest competitor in men's dress shoes. Although Commissioners Huston Thompson and J. S. Nugent filed complaint, no action was taken in the merger of the General Baking Company, Ward Baking Corporation and Continental Baking Corporation, a consolidation affecting 157 plants with a capitalization of $400,000,000. As the result of an extended investigation into the activities of the Aluminum Company of America the Federal Trade Commission made public on September 24 a complaint charging the company with failure to comply with a previous court order and with practices tending to establish a monopoly in aluminum in the United States. The closing months of the year were marked by renewed activity on the part of the Commission. On October 20 hearings began in connection with the complaint filed against the Radio Corporation of America, and on November 24 similar testimony was heard with reference to charges of monopoly control in the moving picture industry. The Commission partially reversed its previous ruling against publicity by publishing allegations of unfair trade methods used by agents of the National Cash Register Company. There was no certainty, however, that the members of the Federal Trade Commission had decided to use the weapon of publicity more frequently.

United States Shipping Board.—The troubles in the United States Shipping Board were fundamentally the same as those which seemed to impair public confidence in the Federal Trade Commission. Congress entrusted to the Board the management of the Emergency Fleet Corporation which operated the government's ships. Criticism of the policies of the Shipping Board in its administrative duties caused President Coolidge in January, 1924, to propose that all the work of operating United States ships be delegated to Admiral Leigh Palmer. The members of the Board rather unwillingly accepted the President's suggestion, appointed Admiral Palmer and gave him almost complete authority. During 1925 the disposal of the government's surplus ships to private companies became the chief bone of contention. The sale of five ships to the R. Stanley Dollar Company for $3,850,000 was challenged by the Pacific Mail Steamship Company, which sought a court injunction to prevent the transfer. It was claimed that by the sale the Shipping Board was conferring on the Dollar lines monopoly control of a certain type of carrier. On April 20 President Coolidge ordered an investigation of the sale, but on the same day the court upheld the transfer as valid under the terms of the Merchant Marine Act of 1920. On May 14 further controversy developed over Henry Ford's offer to buy some 400 vessels, which were lying idle, at a figure to be determined without competitive bidding. Certain members of the Shipping Board vigorously opposed the idea of selling useless ships at a private sale without competition between purchasers. It was admitted at the White House, however, that the Board possessed the power to dispose of the vessels as it saw fit. Chairman O'Connor continued negotiations with the Ford Motor Company, but no sale was effected until August 4, when 200 vessels were transferred to the company at a price that represented their scrap value.

In the meantime, President Coolidge had intervened in the controversy, recommending on June 5 that Admiral Palmer, as President of the Emergency Fleet Corporation, be authorized to negotiate future sales. After deliberation the Shipping Board again complied with the President's wishes. As a result of the change in authority, it was announced on July 6 that operators of vessels owned by the government would be given the first opportunity to purchase ships then in commission. Bids were opened at the same time on 200 ships to be sold for scrap. Opposition to Admiral Palmer's methods speedily developed and a movement within the Shipping Board was started for the purpose of recovering the authority which had been surrendered at the request of President Coolidge. The outstanding critic of the Palmer administration was Commissioner Bert E. Haney of Oregon. On August 27 President Coolidge demanded Mr. Haney's resignation on the ground that the Commissioner had only been reappointed to the Shipping Board earlier in the summer, after he had promised the President to abandon the campaign to discredit Admiral Palmer. Commissioner Haney refused to resign, denied that he had made any promises to the President, challenged the President's authority to remove him and pointed out the fact that the Shipping Board had become a mere administrative agency under complete executive control. This he insisted was contrary to the intention of Congress when it created the Shipping Board.

Though President Coolidge was not convinced that he had the power to remove a member of the Board, he remained in the contest by announcing on September 1 that he would support Admiral Palmer. The struggle came to a climax early in October, when a majority of the Shipping Board removed Admiral Palmer and designated E. E. Crawley of Boston as President of the Emergency Fleet Corporation. This action directly challenged the policy and authority of President Coolidge, who appointed a special commissioner, H. G. Dalton of Cleveland, to make a thorough investigation of the controversy. As a protest against the Shipping Board's action, Rear Admiral H. I. Cone resigned as General Manager of the Fleet Corporation. President Coolidge indicated in his message to Congress in December that he favored a single executive head for the government merchant marine with the Shipping Board's powers limited to judicial and regulatory functions.

Interstate Commerce Commission.—Chief interest in the work of the Interstate Commerce Commission during the year centered in its hearings regarding the proposed Nickel Plate merger. The consolidation plans formulated largely under the guidance of the Van Sweringen brothers of Cleveland involved the Nickel Plate, Chesapeake and Ohio, Erie, Hocking Valley and Pere Marquette roads. When the approval of the Interstate Commerce Commission was sought, considerable opposition to the project developed among the minority stockholders of the Hocking Valley and Chesapeake and Ohio railroads. As a result the hearings before the Commission were prolonged. From April to the close of the year arguments for and against the merger were heard at intermittent sessions. On December 19 Commissioner Charles C. McChord announced that a decision would not be reached before January, 1926. President Coolidge was particularly interested in the outcome of the hearings because he believed that the decision of the Interstate Commerce Commission would have a far-reaching effect on future plans for railroad consolidation. There was a strong feeling in Administration circles that the Interstate Commerce Commission would eventually approve the Nickel Plate merger with certain modifications in traffic arrangements and financial adjustments which would make the plan more acceptable to the stockholders of the protesting roads.

The failure of the Chicago, Milwaukee & St. Paul Railway in March and its subsequent passing into the hands of a receiver resulted in an investigation by the Interstate Commerce Commission to determine whether the receivership was made necessary by legitimate economic difficulties. A committee organized by certain holders of the railroad's securities charged that the bankruptcy petition was filed by the directors for purposes of financial reorganization and was not justified by the condition of the railroad's business. On December 15 Commissioner Cox, who was in charge of the Interstate Commerce Commission's investigation, transferred the hearings from Washington to Chicago in order to obtain a better understanding of the financial embarrassments of the road. It was announced that in January testimony would be taken in New York concerning the St. Paul's dealings with New York banks. On August 12 the Interstate Commerce Commission attempted to provide substitutes for anthracite coal at more reasonable rates when it handed down a decision ordering reductions in freight rates on Virginia smokeless coal to New England and north Atlantic seaports. The Commission approved on October 5 a recommendation of its experts advising the New York, Pittsburgh and Chicago Railroad to abandon its plan to build a new line across the state line of Pennsylvania. It was understood that the proposed line was part of the project of the Delaware and Hudson to construct another trunk line system between Chicago and New York.

The question of the personnel of the Interstate Commerce Commission became a matter of controversy with the nomination of Thomas M. Woodlock of New York to a vacancy which existed. A number of southern Senators, notably Oscar Underwood of Alabama, objected to the appointment on the ground that the membership of the Commission should represent regional interests and that the South was entitled to representation. Although the nomination was not confirmed by the Senate, President Coolidge on March 25 gave Woodlock a recess appointment. There were many suggestions that the matter of regional representation could be worked out more easily if the membership of the Interstate Commerce Commission were increased. In December Commissioner McChord stated that an increase in membership from eleven to thirteen would facilitate the work of the Commission. At the same time President Coolidge indicated his opinion that two additional commissions were desirable.

FEDERAL PROSECUTIONS

By John A. Krout

Professor at Columbia University

Oil Land Leases.—Reverberations of the Congressional investigations into the leasing of United States oil lands were heard in the federal courts during 1925. Civil suits were instituted by the government against Harry F. Sinclair and the Mammoth Oil Company in connection with the Teapot Dome lease, and against Edward L. Doheny and his associates in connection with the Elk Hills lease. The latter case was heard by District Judge Paul McCormick at Los Angeles. His decision handed down on May 28 favored the government's contention on all points. The contracts and leases were invalid "by reason of the fraud and conspiracy of Secretary Fall and Mr. Doheny." The court went even further and denied the legality of President Harding's executive order transferring the naval oil lands from the Navy to the Interior Department. An appeal from the decision was immediately taken by the Doheny interests to the Circuit Court of Appeals. In the meantime, the civil suit against the Sinclair companies was argued at Cheyenne, Wyoming, before District Judge F. Blake Kennedy. Proceedings began on March 9 and evidence and argument were presented until March 26. The attorneys for the United States, Owen J. Roberts and Atlee Pomerene, sought cancellation of the lease on the ground that there had been collusion and fraud in the granting of the lease by Secretary Albert B. Fall and representatives of the oil company. The evidence of fraud was more circumstantial than in the case of the Elk Hills lease and the government attorneys were not able to present all the testimony that they hoped to secure. Judge Kennedy reserved judgment and did not announce his decision until June 19. His opinion was almost directly opposite to the conclusion reached by Judge McCormick in the Doheny case. Judge Kennedy held that President Harding's executive order transferring the oil reserves to the Department of Interior was legal. He found "suspicious circumstances," but no evidence of conspiracy in the financial dealings of Secretary Fall and his son-in-law with the Continental Trading Company whose officers were connected with the Sinclair oil interests. By his decision Teapot Dome remained in the hands of Harry F. Sinclair. On July 6 counsel for the government filed a motion for a re-opening of the case claiming that new evidence had been discovered. When Judge Kennedy denied the motion, an appeal was taken to the Circuit Court of Appeals. It was hoped that the higher court would straighten out the legal tangle in which the oil land cases had become involved.

Federal attorneys secured an indictment against Albert B. Fall, Harry F. Sinclair, Edward L. Doheny and Edward L. Doheny, Jr., charging bribery and conspiracy to defraud the United States government. On April 3, however, Chief Justice McCoy of the District of Columbia quashed the indictment on a technicality connected with the presentation of the case to the grand jury. An appeal from Justice McCoy's decision was carried to the Court of Appeals of the District of Columbia, which overruled the lower court. On December 19 the Court of Appeals refused the motion of attorneys for Fall and the Dohenys to reconsider its decision that the original indictments were valid. There was a possibility that the defendants would attempt to carry the case to the United States Supreme Court. On May 28 new indictments were returned by a federal grand jury at Washington, which dropped the bribery charge and emphasized the criminal conspiracy to defraud the government of property through the negotiation of the oil land leases. A lengthy postponement was granted in order to allow opposing counsel to prepare. There were indications in April that the final report of the Senate Committee on Public Lands, which was investigating the activities of the Midwest Refining Company in the Salt Creek oil fields of Wyoming, might throw additional light on the Teapot Dome lease.

Wheeler Case.—Two federal suits against Senator Burton K. Wheeler of Montana aroused widespread interest because of their apparent political implications. Senator Wheeler charged that the prosecutions were inspired by the enemies he had made through his conduct of the investigation into the affairs of the Department of Justice, while Harry M. Daugherty was Attorney-General. He was first indicted by a federal grand jury at Great Falls, Montana, on the charge of accepting payment, after he became United States senator, for representing a constituent in matters pending before the Interior Department. The case came to trial early in April with Senator Walsh of Montana as Senator Wheeler's chief counsel. When the defendant himself took the stand, he denied the testimony of witnesses for the prosecution that he had made arrangements through former solicitor Edwin S. Booth of the Interior Department to secure favorable action on certain oil land claims which Gordon Campbell of Montana had filed with the department. The case went to the jury on April 24, and after ten minutes of deliberation a verdict of acquittal was returned. Senator Wheeler was also indicted on March 27 by a grand jury in the District of Columbia, on the charge of conspiring with Edwin S. Booth and Gordon Campbell to secure more than the legal number of permits to prospect upon public lands for oil and gas. It was substantially the same transaction as that for which he had been indicted in the state of Montana. After his acquittal at Great Falls Senator Wheeler entered a demurrer and plea of former acquittal in answer to the District of Columbia indictment. On November 30 William E. Leahy, special assistant to the Attorney-General, admitted that the government's case was weak because the federal statute fails to specifically limit the number of permits that may be issued to one person. Justice Jennings Bailey took under advisement the plea of Senator Walsh, counsel for Senator Wheeler, that the case against the defendants be thrown out of court.

BIBLIOGRAPHY OF AMERICAN HISTORY

By Edward F. Rowse
New York State Library, Albany

Among the publications in American History appearing in 1925, the following are noteworthy, in addition to the special bibliographies which are listed in other departments of the Year Book:

Adams, E. D.—*Great Britain and the American Civil War.* N. Y., Longmans. A much needed piece of work in which the author has said the last word that need ever be said on the subject.

Adams, R. G.—*A History of the Foreign Policy of the United States.* N. Y., Macmillan. Unusually readable and suggestive survey. Not fundamental, but very useful.

Andrews, C. M.—*The Colonial Background of the American Revolution.* New Haven, Yale Press. A scholarly consideration of the causes of the Revolution together with a plea for the whole truth in considering its history.

Beck, J. M.—*The Constitution of the United States.* N. Y., Doran. Interesting, good and timely.

Barton, W. P.—*The Life of Abraham Lincoln.* Indianapolis, Bobbs-Merrill. Sheds new light on the life of Lincoln before the Presidency.

Channing, Edward.—*History of the United States.* Vol. VI. N. Y., Macmillan. A fair and scholarly presentation of the period of the Civil War, done by a great scholar and interesting writer.

Dexter, Elizabeth Anthony.—*Colonial Women of Affairs.* Boston, Houghton, Mifflin. A serious study of economic activities of women in the Colonial period.

Faulkner, H. U.—*American Economic History.* N. Y., Harper. An economic history of the whole period 1607-1925. Well done and readable. Subtopics very well treated.

Ganoe, W. A.—*The History of the United States Army.* N. Y., Appleton, 1924. Tells the story of the army from Washington to Pershing. Places emphasis on the work of the rank and file.

Gompers, Samuel.—*Seventy Years of Life and Labor.* N. Y., Dutton. A readable and important book, but not too informing as to certain phases of the problem of unionism.

Harlow. R. V.—*The Growth of the United States.* N. Y., Holt. A college text-book, which places more emphasis on social history than on wars and politics. Useful for its outlook on Twentieth Century history.

Hubbard, B. H.—*A History of the Public Land Policies of the United States.* N. Y., Macmillan. Useful only for the period since 1862.

Maurice, Sir Frederick,—*Robert E. Lee, the Soldier.* Boston, Houghton, Mifflin. A brilliant study of the military ability of Lee, not a biography.

MUZZEY, D. S.—*The United States of America.* 2 vols., N. Y., Ginn. Emphasizes social history and the history of the Twentieth Century.

OSGOOD, H. L.—*The American Colonies in the Eighteenth Century.* 4 vols., N. Y., Columbia University Press. A most ambitious monument to historical research, ably executed and in a scholarly manner.

PARKER, W. B.—*The Life and Services of Justin Smith Morrill.* Boston, Houghton, Mifflin. A careful and authoritative biography, which records in a clear and pleasant fashion these most important years of our national life.

PASQUET, D.—*Histoire Politique et Sociale du Peuple Americain.* Paris, Picard. A history of the United States written by a Frenchman for Frenchmen to read.

PAXSON, F. L.—*History of the American Frontier, 1763-1893.* Boston, Houghton, Mifflin. An admirable history of the West.

ROWE, H. K.—*The History of Religion in the United States.* N. Y., Macmillan. Interpretive.

SHIPPEE, L. B.—*Recent American History.* N. Y., Macmillan. Very good history of the period since the Civil War, with emphasis on the period since 1900.

WHITE, W. A.—*Woodrow Wilson, the Man; his Times, and his Task.* Boston, Houghton, Mifflin. A biography, not by a personal friend, but by one who gathered the opinions of many and writes with a highly sympathetic touch.

WILLIS, H. P.—*The Federal Reserve System; Legislation, Organization, and Operation.* Ronald Press. A good collection, but not woven together well. A set of annals rather than a history.

WILSON, Woodrow.—*Messages and Papers.* 2 vols., N. Y., Harper. To be completed in 6 volumes. President Wilson's papers as President of Princeton and Governor of New Jersey.

THE UNITED STATES FOREIGN SERVICE

BY MARGARET DEFOREST HICKS

POLITICAL EXPERT, WAR DEPARTMENT GENERAL STAFF

A momentous and far-reaching change occurred in the status of the diplomatic and consular services of the United States when, on July 1, 1924, the so-called Rogers Bill became a law. By this act, approved on May 24, 1924, the former diplomatic and consular services were merged into one, to be known thenceforth as the United States Foreign Service.

Prior to 1906, both the diplomatic and consular services were administered on a political basis. In that year the consular service was placed on a civil service basis, and three years later (1909) a similar status was accorded the diplomatic service also.

There were, however, manifest improvements needed even after these two results had been brought about, and it was to effect these improvements that the Rogers Bill was drafted and made a law.

Purposes of the Rogers Bill.—The most obvious weaknesses of the former dual system centered about salaries, promotions, non-interchangeability of position between the two services, and the lack of adequate retirement provisions. The principal sections of the Rogers Bill (Public—No. 135—68th Congress; H. R. 6357) deal with these problems most effectively. By virtue of its provisions: (*a*) sufficiently adequate salaries are provided to make it possible for men not possessing independent means to enter the service; (*b*) sufficient reward for meritorious service is offered to attract and hold able men by placing within the reach of all who show adequate ability the attainment of the grade of minister; (*c*) foreign service officers may be assigned either to consular or diplomatic posts, the positions being interchangeable; (*d*) a retirement and pension system is inaugurated.

Analysis of the Rogers Bill.—Provision is made that "hereafter the Diplomatic and Consular Service of the United States shall be known as the Foreign Service of the United States." (Section 1.)

The term "Foreign Service officer" shall be the designation of every member of the Foreign Service below the rank of minister "all of whom are subject to promotion on merit and who may be assigned to duty in either the diplomatic or the consular branch of the Foreign Service at the discretion of the President." (Section 2.)

The former diplomatic and consular classes are done away, and provision is made for nine new classes with salaries ranging from $9,000 in class one, downward to $3,000 in class nine; and with unclassified subordinate grades from $3,000 downward. (Sections 3, 4.)

Appointments to the position of Foreign Service officer shall be made only after examination and a suitable period of probation in an unclassified grade; or, after five years of continuous service in the Department of State, by transfer therefrom under such rules and regulations as the President may prescribe. (Section 5.)

From time to time the Secretary of State shall report to the President the names of Foreign Service officers showing special ability, or showing merit for promotion to the grade of minister; and the names of persons found upon taking the prescribed examinations to have fitness for appointment to the service. (Section 6.)

Reclassification of the former diplomatic and consular officers as provided into the new grades one to nine respectively, prescribed under the new law. (Sections 7, 8.)

All Foreign Service officers must deposit a bond with the Treasury of the United States. (Section 9.)

Foreign Service officers inspecting either consular or diplomatic offices shall have the same duties, powers, and prerogatives formerly accorded the consuls general at large under the old system. (Section 10.)

Financial provisions are made. (Section 11.)

A very important provision, in view of the fact that the act does not raise the salaries of Ambassadors ($17,500) or Ministers ($12,000 and $10,000), is that the President may grant them "representation allowances out of any money which may be appropriated for such purposes from time to time by Congress."

Funds for a private secretary to each Ambassador are provided. (Section 13.)

Any Foreign Service officer may be assigned to the Department of State for a limited period without loss of class or salary. (Section 14.)

At the discretion of the Secretary of State, a Foreign Service officer may be ordered to the United States on statutory leave of absence. (Section 15.)

Service officers may be appointed to serve as Counselors of Embassy or Legation, commissioners, chargés d'affaires, ministers resident, or diplomatic agents without loss of grade, class, or salary with, in certain cases, additional compensation. (Sections 16, 17.)

Foreign Service officers may be retired upon reaching the age of 65 years, annual pensions may be paid from an annuity fund secured by a yearly deduction of 5 per cent. from salaries, and a commensurate yearly contribution to the fund by the Government. (Section 18.)

Retired Foreign Service officers may be recalled to active service, in the event of public emergency. (Section 19.)

All former provisions of law not inconsistent with the present Act are made applicable, and all contrary provisions are repealed. (Section 20.)

Financial provisions appear. (Section 21.)

"The titles 'Second Assistant Secretary of State' and 'Third Assistant Secretary of State' shall hereafter be known as 'Assistant Secretary of State' without numerical distinction of rank." An additional "Assistant Secretary of State" replaces the former position of Director of the Consular Service. (Section 22.)

"This Act shall take effect on July 1, 1924." (Section 22.)

Administrative Regulations. — Of equal importance with the Rogers Bill are the Administrative Regulations embodied in Executive Order No. 4022, June 7, 1924. These regulations give practical effect to all the chief purposes of the law. They set up the machinery whereby it is put into operation by providing for a Foreign Service Personnel Board, an Executive Committee, a Board of Examiners, a Foreign Service School, and a Foreign Service School Board.

Foreign Service Personnel Board.—The duties of this board are, to examine into the character, ability, efficiency, experience and general availability of all members of the Service with a view to promotion, transfers, the consideration of controversies or delinquencies, and the recommendation of those showing marked general ability to the rank of minister, as vacancies arise. The board is composed of the Under Secretary of State, who is chairman, an Assistant Secretary of State designated by the Secretary of State, the Assistant Secretary of State formerly known as the Director of the Consular Service, and members of the Executive Committee of the Foreign Service Personnel Board.

The Executive Committee.—The duties of the Executive Committee of the Foreign Service Personnel Board are left to the discretion of the Secretary of State and are prescribed by him. The board is composed of a chairman, and two other members who are Foreign Service officers of high rank representing both the diplomatic and consular branches of the Foreign Service. These three are selected by the other members of the Personnel Board with the approval of the Secretary of State.

The Board of Examiners.—The duties of this board are to formulate rules for and hold examinations of applicants for commission to the Foreign Service and to determine those who are fitted for appointment, and the scope and method of the examinations which shall be both oral and written and open only to American citizens of good standing between the ages of 22 and 35 and designated by the President for appointment subject to examination. The board is composed of the Under Secretary of State, an Assistant Secretary of State to be designated by the Secretary of State, the Assistant Secretary of State formerly known as the Director of the Consular Service, the Chairman of the Executive Committee of the Foreign Service Personnel Board, and the Chief Examiner of the Civil Service Commission or such person as may be designated by him to serve in his stead.

The Foreign Service School.—The purpose of this school is to provide a one year term of instruction in the Department of State as a period of probation for those successfully passing the examinations given by the Board of Examiners, and to adjudge, during this period, the new appointees to the Service, as to their qualifications for advancement and assignment to duty as a Foreign Service officer. The governance of the school is to be set forth in rules and regulations prescribed by the Secretary of State. The school is under the direction of the Foreign Service School Board.

The Foreign Service School Board.—The duties of this board are to act in all matters concerning the functions of the school with the approval of the Secretary of State; to select the chief instructor of the Foreign Service School from among the officers of the Foreign Service with the approval of the Secretary of State; and in its discretion to select other instructors from among the qualified officers of the Department of State, the Foreign Service, the executive departments of the government, and other available sources. The board is composed of the Under Secretary of State, an Assistant Secretary of State to be designated by the Secretary of State, the Assistant Secretary of State formerly known as the Director of the Consular Service, the chairman of the Executive Committee of the Foreign Service Personnel Board, and the chief instructors of the Foreign Service School.

Reclassification.—The practical results of the putting into effect of the provisions of the Rogers Act and Executive Order number 4022 may be seen from the following table which shows the reclassification from the old to the new status with salaries.

Former Classification	Former Salary	New Classification as Foreign Service Officer	New Salary	No. in Grade as of Oct. 1, 1925
Secretary, Class One (Counselor of Emb.)	4,000	Class One	9,000	23
Consul General, Class One	12,000 *	Class One	9,000	
Consul General, Class Two	8,000	Class One	9,000	
Secretary, Class One (Counselor of Leg.)	4,000	Class Two	8,000	23
Consul General, Class Three	6,000	Class Two	8,000	
Secretary, Class One	4,000	Class Three	7,000	51
Consul General, Class Four	5,500	Class Three	7,000	
Consul General at Large	5,000	....	5,000	
Secretary, Class Two	3,625	Class Four	6,000	56
Consul General, Class Five	4,500	Class Four	6,000	
Consul, Class One	8,000 *	Class Four	6,000	
Consul, Class Two	6,000	Class Four	6,000	
Consul, Class Three	5,000	Class Four	6,000	
Chinese Secretary	5,500	Class Four	6,000	
Japanese Secretary	5,500	Class Four	6,000	
Turkish Secretary	5,500	Class Four	6,000	
Consul, Class Four	4,500	Class Five	5,000	64
Secretary, Class Three	3,000	Class Six	4,500	78
Consul, Class Five	4,000	Class Six	4,500	
Chinese Asst. Secretary	4,000	Class Six	4,500	
Japanese Asst. Secretary	4,000	Class Six	4,500	
Turkish Asst. Secretary	4,000	Class Six	4,500	
Consul, Class Six	3,500	Class Seven	4,000	97
Secretary, Class Four	2,500	Class Eight	3,500	100
Consul, Class Seven	3,000	Class Eight	3,500	
Consul, Class Eight	2,500	Class Nine	3,000	1
Consul, Class Nine	2,000	Class Nine	3,000	
Vice-Consul of Career	2,500-2,750-3,000	Unclassified	3,000	153
Consular Assistants	1,500-2,500	Unclassified	2,500	
Interpreters	2,000	Unclassified	2,000	
Student Interpreters	1,500	Unclassified	1,500	

* Section 8 of the Rogers Act provides "that consuls general of class one and consuls of class one holding office at the time this Act takes effect shall not, as a result of their recommissioning or reclassification suffer a reduction in salary below that which they are then receiving: *Provided, however,* that this provision shall apply only to the incumbents of offices mentioned at the time this Act became effective."

DIPLOMATIC PERSONNEL

By Margaret deForest Hicks

Political Expert, War Department General Staff

During the year 1925, three hundred and four persons took the examinations for appointment as officers in the United States Foreign Service. Of this number thirty-nine were passed. Of the thirty-nine, thirty-seven have successfully completed the Foreign Service School course in the Department of State and have been commissioned as Foreign Service officers unclassified. One woman was among those commissioned.

Promotion during the year from class to class has been steady and satisfactory and no less than five Foreign Service officers have been appointed to the grade of Minister. It is considered that the provisions whereby the new service has come into being have proved notably successful during the year 1925.

EUROPEAN DEBTS AND CLAIMS

By Charles G. Fenwick
Professor at Bryn Mawr College

FRENCH DEBT

Conference on Allocation of German Payments.—During January, 1925, the United States became a party to the financial arrangement between Germany and the Allied Powers under the terms of the Dawes Plan. Myron T. Herrick, Ambassador to France, Frank B. Kellogg, Ambassador to Great Britain and Colonel James A. Logan, unofficial observer of the Reparation Commission, were instructed to represent their government at a conference of finance ministers at Paris, January 7, to allocate reparation payments from Germany. January 14 the three American representatives signed an "Agreement Regarding the Distribution of Dawes Annuities." The Senate promptly requested the Secretary of State to present the text of the agreement. In a letter of explanation (February 3) he said:

"The conference of Finance Ministers held at Paris was for the purpose of reaching an agreement as to the allocation of the payments expected through the operation of the Dawes plan. In view of the inclusive character of these payments, it was necessary for the United States to take part in the conference in order to protect its interests. The conference at Paris was not a body, agency or commission provided for either by our treaty with Germany or by the Treaty of Versailles. In taking part in this conference there was no violation of the reservation attached by the Senate to the treaty of Berlin. The agreement does not provide for sanctions or deal with any questions that might arise if the contemplated payments should not be made. With respect to any such contingency, the United States will be as free as it ever was to take any course of action it may think advisable."

Nevertheless Senator Ladd of North Dakota introduced (February 25) a request to the President that he refrain from action in any matter involving financial relations or military intervention "without specific prior authorization of Congress." The Senate, however, failed to sanction this intended rebuke to the Administration.

Caillaux Commission.—September 24, 1924, the French Debt Commission, headed by the Minister of Finances, Joseph Caillaux, met at Washington with the American World War Debt Commission, headed by Andrew J. Mellon, Secretary of the Treasury. The principal of the debt amounted to $3,340,516,043, which, with interest accruing since 1919, brought the total sum to approximately $4,200,000,000. Of this total sum $407,000,000 represented a debt contracted by the purchase of surplus war-supplies from the United States subsequent to the armistice. Interest upon this item, due for repayment in 1929, had been paid since 1919, amounting, at 5 per cent., to an annual sum of $20,350,000.

The first proposal made by the French Commission contemplated a series of payments beginning with $25,000,000 a year for five years and increasing thereafter to maximum payments of $80,000,000 to $90,000,000, the successive payments being spread over a period of 62 years and aggregating approximately the sum of $4,200,000,000, the present amount of the debt. This proposal was unacceptable to the American Commission, which thereupon submitted a counter-proposition calling for graduated payments over a similar period of 62 years, the aggregate of which would amount to approximately $10,000,000,000.

Difference of Point of View.—The gap between the two proposals offered little opportunity for compromise, especially in view of a desire on the part of the French Commission to insert a "safeguard proviso" by which, in the event of the failure of Germany to meet its reparation obligations to France, the latter might bring up its own obligations to the United States for reconsideration. On September 30 the French Commission submitted a new offer calling for payments spread over 68 years and aggregating approximately $6,220,000,000, beginning with preliminary annual payments of $40,000,000,000 for the first five years, $60,000,000,000 for the next seven years, and $100,000,000,000 annually thereafter for fifty-six years. This second proposal was also unacceptable to the American Commission, which accepted the French view that the preliminary payments represented the maximum capacity to pay during that period, but differed from the French view in respect to future capacity to pay.

Temporary Arrangement. — Complete failure of the negotiations was prevented by the proposal of the American Commission that a temporary agreement be entered into providing for the payment by France of $40,000,000 annually for five years. This sum would represent interest on the far larger part of the debt contracted under the Liberty Loan acts, and also would include the $20,000,000 which had been paid annually since 1919 on the debt contracted by the purchase of surplus war-supplies. As M. Caillaux had not been authorized to enter into a provisional agreement, he declined the offer formally, but was ready to take it back with him in the hope of possible approval by the French Parliament. By this means the departure of the French Commission on October 3 left the negotiations still open and expressions of mutual friendship and respect were indulged in by both delegations.

Political Considerations.—Throughout the negotiations it was clear that on both sides political considerations influenced the opinions of the two commissions as to France's capacity to pay, which was accepted as the only fair basis of negotiation. Upon this point, a relative one within certain limits, President Coolidge felt that the American tax-payer would not sanction further concessions, while M. Caillaux had in mind not only the bad state of French finances but the probable repudiation by the French tax-payer of any statesman who had put upon them so heavy a burden.

One generally recognized advantage of the provisional agreement, if approved by the legislatures of both countries, was that within the next five years the schedule of payments by Germany to France under the Dawes plan would come up for revision, and it would then be possible to figure accurately upon that item of France's capacity to pay which was at the time merely speculative. The provisional agreement was, however, rejected by the French Cabinet, which shortly after resigned. The new Finance Minister, M. Loucheur, announced on December 3, in a communication to the American Debt Commission through the French Ambassador in Washington, his "desire to have the debt question settled as speedily as possible on a basis satisfactory to both France and the United States."

Italian Debt.—Within a month of the failure of the French debt negotiations an Italian commission, headed by Count Volpi, met on November 2 with the American Debt Commission at Washington and on November 14 formally signed an agreement. This agreement fixes the total indebtedness of Italy, as of June 15, 1925, at $2,042,199,466.34 and provides that, after payment of a cash sum of $199,466.34, the remainder shall be paid in graduated annual instalments over a period of 62 years, beginning with payments of $5,000,000 for the first five years. The settlement contemplates no interest during this five-year period and only low rates, increasing from one-eighth of 1 per cent. to a maximum of 2 per cent., for the succeeding years. The explanation of the easier terms given to Italy in contrast with those required of France lies in the fact that the American Debt Commission proceeded in both cases upon the principle of capacity to pay. The low average rate of interest, less than 1 per cent. for the whole period, represents a practical cancellation of about 75 per cent. of the principal of the debt and interest charges at normal rates. Immediately following the signing of the agreement Count Volpi tendered a check for the first annual instalment of $5,000,000.

Belgian Debt.—An unusual situation was presented in the case of the Belgian debt, which at the time of settlement on August 18 amounted to $417,780,000, including arrears of interest. The debt divided itself into two parts, $171,780,000 having been contracted during the war and $246,000,000 having been contracted after the armistice. With respect to the pre-armistice debt the American Debt Commission found itself in the presence of an agreement entered into by President Wilson at the Peace Conference at Paris in 1919 in accordance with which Germany was to take Belgium's place as debtor. Art. 232 of the Treaty of Versailles, signed by the United States, provided that Germany was to "make reimbursement of all sums which Belgium has borrowed from the Allied and Associated Governments up to November 11, 1918," including interest at 5 per cent. As the United States had refused to ratify the treaty the American Debt Commission did not consider itself legally bound by the arrangement. Consequently it rejected the Belgian contention that this part of the debt should be recovered from the reparations to be paid by Germany under the Dawes plan. But the American Commission nevertheless recognized "a weighty moral obligation" which "entirely differentiates this sum from all other debts due the United States from foreign countries." In consequence interest was cancelled on this part of the debt, so that, with payments spread over 62 years, the present principal of the debt was sharply reduced. The post-armistice debt was funded by annual instalments spread over 62 years, with interest at 3½ per cent. after the tenth year. Smaller payments were arranged for the first ten years. The total interest during the period of funding thus will amount to $310,050,500, which, added to the principal of the post-armistice debt and to the pre-armistice debt upon which no interest was charged, will bring the total payment to $727,830,500. The agreement will have to be approved by Congress since the special arrangement with respect to the pre-armistice debt does not come within the terms of the law under which the Debt Commission is acting.

Other Settlements.—September 24 it was announced by Secretary Mellon that a settlement had been agreed upon with Latvia for its debt of $5,775,000. On October 9 Czechoslovakia settled for its debt of $115,000,000. Annual payments of $3,000,000 will be made for 18 years and about $6,000,000 for 44 years, interest being at the rate of 3 per cent. for 10 years and 3½ per cent. thereafter, the total payments at the end of 62 years amounting to approximately $300,000,000. Esthonia settled on October 28 for a funded indebtedness of $13,830,000. Roumania settled on December 1 for a debt of $44,591,000, payments being spread as in other cases over a period of 62 years with interest at 3 per cent. for ten years and 3½ per cent. thereafter.

United States — German Mixed Claims Commission. — August 10, 1922, an agreement was signed at Berlin by the United States and Germany providing for the establishment of a mixed commission as the agency for the determination of the amount to be paid by Germany in satisfaction of Germany's financial obligations under the "Treaty Restoring Friendly Relations" concluded by the two governments on August 25, 1921. The commission was authorized to pass upon three sets of claims: those arising from injury to person or property "within German territory as it existed on August 1, 1914"; "other claims" for loss or damage to which the United States or its nationals had been subjected since July 31, 1914, as a consequence of the war; and debts owing to American citizens by the German Government or by German nationals. The commission was to consist of one commissioner appointed by each of the two governments and an umpire to be selected by mutual agreement. On the day of the signing of the Berlin agreement the German Chancellor, to give proof of his Government's confidence in the desire of the United States to reach a fair settlement, requested that the President of the United States designate the umpire, and William Rufus Day, Associate Justice of the Supreme Court of the United States, was accordingly chosen. Upon the resignation of Justice Day, Hon. Edwin B. Parker was designated as umpire, the two other commissioners being Chandler P. Anderson for the United States, and Wilhelm Kiesselbach for Germany. The commission held its first session on Oct. 9, 1922, and continued its hearings throughout 1923, 1924 and 1925. In November, 1925, it was announced that with the completion of the "Lusitania Claims" there remained but a relatively small number and that the work of the commission would soon be at an end.

OPIUM CONFERENCE

By Charles G. Fenwick
Professor at Bryn Mawr College

Ante Bellum.—The first Opium Convention was adopted at the Hague, January 23, 1912. Called upon the initiative of the United States, the Conference took up the work unfinished at Shanghai in 1909 and elaborated an agreement under which the contracting powers pledged themselves individually to enact efficacious laws for the control of the production and distribution of raw opium and to prevent the exportation of raw opium to countries which should have prohibited or restricted its importation; moreover, they were to take measures for the gradual and efficacious suppression of the manufacture of traffic in, and use of prepared opium. Administrative duties in connection with the Convention were entrusted to the Netherlands Government. Further conferences took place at the Hague in 1913 and 1914.

Conference of 1924.—Following the establishment of the League of Nations the members of the League, in pursuance of Art. 23, c. of the Covenant, entrusted to the League the administrative duties formerly assigned to the Netherlands Government. The United States, however, not being a member of the League, continued for a time to correspond with the Dutch Government as an intermediary. On Feb. 21, 1921, the Council of the League appointed a Permanent Advisory Committee on Opium, and in 1923 the United States appointed a representative to act with the Committee in an unofficial and consultative capacity.

An International Conference on Opium met November 17, 1924, at Geneva, under the auspices of the League of Nations. This conference was called the "Second Conference" to distinguish it from a smaller group of states having far-eastern dependencies, which had met immediately before to consider its own special problems.

American Proposition.—The United States was officially represented by a delegation, authorized by act of Congress, Jan. 28, 1924, and headed by Stephen G. Porter, Congressman from Pennsylvania. The American delegation urged upon the Conference an elaborate plan as follows:—(1) The production and distribution of raw opium and coca leaves be regulated by each government so as to leave no surplus for uses not strictly medical or scientific, an exception being made in favor of the production for exportation into territories where raw opium was manufactured into prepared opium and the use of prepared opium was still temporarily permitted. (2) Separate licences were to be required for each importation and exportation of raw opium or coca leaves. (3) Measures were to be taken for the gradual and effective suppression of the manufacture of, internal trade in, and use of prepared opium. (4) To this end the Contracting Parties were to prohibit the import and export of prepared opium. (5) In countries where the use of prepared opium was still temporarily permitted imports of raw opium were to be reduced by

10 per cent. of present importation each year for a period of 10 years, at the end of which period imports were to be prohibited altogether. (6) The manufacture, sale, and use of morphine, cocaine and their respective salts and derivatives were to be limited to medical and scientific purposes. (7) Strict supervision, by means of licences, was to be exercised to this effect. (8) The manufacture and distribution of heroin was to be absolutely prohibited. (9) A permanent Central Board, representing the contracting parties, was to be established as an agency for checking the consumption of narcotics in the different countries.

Proposal Rejected.—The drastic proposals of the American delegation were, however, not acceptable to the powers with colonial dependencies or to Japan. Adjournment was taken on Dec. 16, and the conference reconvened on Jan. 19. The British delegation, having before it the practice of opium smoking in India, opposed the American plan for putting a stop to opium smoking in ten years, but offered an alternative plan for stopping this use of opium in fifteen years on condition that the fifteen-year period should begin to run from the time when China should have so far suppressed her production of raw opium as to remove the danger of opium smuggling into neighboring countries. Acrimonious interchanges followed between the heads of the American and of the British delegations.

Americans Withdraw.—February 6 the American delegation withdrew from the Conference, submitting with its letter of withdrawal a memorandum in which Mr. Porter pointed out that the reports of the committees indicated that there was no hope that the production of raw opium and coca leaves would be restricted to medical and scientific needs and that the unwillingness of certain nations to provide for the progressive reduction of the use of raw opium for the manufacture of smoking opium was a contributing factor in the problem of restricting the production of raw opium. The Chinese delegation likewise withdrew (February 7) from the Conference.

Convention Completed.—The other members of the Conference continued their sessions and (February 19) a convention was signed, and adjournment taken. The convention adopted embodied a number of the American proposals, including the plan of a Permanent Central Board, consisting of eight persons to be appointed by the Council of the League of Nations. The United States and Germany were to be invited to nominate one person to sit with the Council of the League and participate in these appointments.

In respect to the production, distribution and export of raw opium the convention went no further than to provide for "effective control"; but in respect to manufactured drugs, including medicinal opium, cocaine, morphine and other narcotics, it was agreed that effective laws should be enacted to limit their manufacture, import, sale, export and use to medicinal and scientific purposes exclusively; and persons engaged in such activities should be controlled by means of special licences. Special import and export authorizations were to be required for each importation and exportation of the designated drugs as a means of control over the international trade. The president of the Conference, Herluf Zahle, in his closing address, recognized the justice of the American proposals and agreed that the only question was as to the time when they could be realized. He then emphasized the hopeful fact that the drugs question had been "caught in the day-to-day machinery of the League of Nations" so that the conference was but the beginning of an accelerating movement.

ARMS TRAFFIC CONFERENCE

By Charles G. Fenwick

Professor at Bryn Mawr College

Invitation of League of Nations.—The Secretary General of the League of Nations (Oct. 7, 1924) wrote to Secretary of State Hughes informing him of a resolution of the Council of the League of Nations with respect to the holding of a conference on the traffic in arms and inquiring whether the Government of the United States would be prepared to take part in such a conference. In reply (Dec. 9) Secretary Hughes stated that the United States would be disposed to give favorable consideration to an invitation to such a conference. The Council of the League thereupon fixed May 4, 1925, as the opening day of the conference.

Conventions.—On that day the delegates of 44 nations, including the United States, met at Geneva. The sessions of the conference continued until June 17, and resulted in a series of instruments: (1) "Convention for the Supervision of the International Trade in Arms and Ammunition and in Implements of War." (2) "Protocol for the Prohibition of the Use in War of Asphyxiating, Poisonous or Other Gases, and of Bacteriological Methods of Warfare." (3) "Declaration regarding the Territory of Ifni." (4) Final Act.

Categories.—The Convention divides arms, ammunition and implements into five categories: (1) Supervision and publicity of all international trade in arms by limiting export to "a direct supply to the Government of the importing State" (Art. 2); (2) Permitting export for supply to private persons if authorized by their Government by means of a license (Arts. 3, 4): (3) Requiring from each Government a statistical return of its foreign trade in arms (Art. 6); (4) Obligation to publish facts with regard to the construction of vessels for war, for export (Art. 7), and of aircraft and aircraft engines exported (Art. 9); (5) "Special zones" are defined, embracing "the whole of the continent of Africa" with certain exceptions, the Arabian peninsula, and an adjoining maritime zone, within which the export of arms is not to be permitted without an export license to be issued only upon specified conditions among which is the authorization of the authorities of the territory (Arts. 12, 13, 14).

Reservations are made from the rules laid down, in favor of Roumania, Poland, Esthonia, Finland and Latvia, by which the prohibitions of the treaty are to be suspended until such time as Russia shall accede to the present convention.

The Protocol, after reciting that the use in war of asphyxiating, poisonous and other gases has been "justly condemned by the public opinion of the civilized world" and has been prohibited in treaties "to which a majority of Powers of the world are Parties" declares that the contracting parties, "so far as they are not already Parties to treaties prohibiting such use, accept this prohibition" and, moreover, that all the signatories agree to extend the prohibition to the use of "bacteriological methods." The convention was signed by 19 countries and the protocol by 29. Provision was made for the adhesion of other states.

TREATIES COMPLETED AND RATIFIED

By Charles G. Fenwick

Professor at Bryn Mawr College

UNITED STATES-PANAMA

Smuggling of Intoxicating Liquors.—(Signed at Washington, June 6, 1924; ratifications exchanged, January 19, 1925; proclaimed, January 19, 1925.)

The treaty follows the lines of the treaty between the United States and Great Britain of Jan. 23, 1924, reaffirming the principle of the three-mile territorial limit, but containing an agreement on the part of Panama to permit the visit and search on the high seas of vessels flying its flag by the authorities of the United States for the purposes of ascertaining whether the vessel is attempting to smuggle intoxicating liquors into the United States. Seizure of the vessel for judicial condemnation is permitted upon reasonable cause found. Search and seizure must not, however, be exercised at a greater distance from shore than can be traversed in one hour by the suspected vessel. On its part the United States agrees to forego seizure of intoxicating liquors kept under seal by Panaman vessels when in its ports. Claims by Panaman vessels arising under the treaty are to be adjusted by a joint commission, or, failing that method, by recourse to the Hague Permanent Court of Arbitration.

UNITED STATES-SWEDEN

Arbitration.—(Signed at Washington, June 24, 1924; ratifications exchanged, March 18, 1925; proclaimed March 18, 1925.)

The treaty follows the lines of the treaty of April 4, 1908, between the United States and Great Britain, stipulating for the submission to arbitration by The Hague Permanent Court of Arbitration, of disputes of a legal nature or relating to the interpretation of treaties, provided, however, that such disputes do not affect the vital interests, the independence, or the honor of the contracting parties, and do not concern the interests of third states. A special "understanding" was annexed to the treaty by which the Permanent Court of International Justice might be substituted for The Hague Court of Arbitration in case the United States should become a member of the former court.

UNITED STATES-CUBA

Isle of Pines.—(Signed at Washington, March 2, 1904; ratifications exchanged, March 23, 1925; proclaimed, March 24, 1925.)

This island, lying about 50 miles off the southwest coast of Cuba, was either included in the provisions of Art. I of the Treaty of Paris, Dec. 10, 1898, by which Spain relinquished "all claim of sovereignty over and title to Cuba," or else, as was held by certain Senators, was included under the provisions of Art. II of the Treaty which ceded Porto Rico and "other islands now under Spanish sovereignty in the West Indies" to the United States. On March 2, 1901, the Platt Amendment was adopted, among its conditions being "that the Isle of Pines shall be omitted from the proposed constitutional boundaries of Cuba, the title thereto being left to future adjustment by treaty." This condition was embodied in Art. VI of the treaty of May 22, 1903, by which the United States relinquished "its authority and government in the island of Cuba" in favor of the Republic of Cuba. On March 2, 1904, the present treaty was signed, being identical with a treaty of July 2, 1903, which had expired by reason of a time limitation, and on Feb. 1, 1906, it was reported favorably by the Senate Committee on Foreign Relations. Ratification of the treaty was, however, delayed, and while the island had been under de facto Cuban government since 1902, it was not until March 13, 1925, that the Senate consented to its ratification. Art. I of the treaty recites that the United States relinquishes in favor of the Republic of Cuba all claim of title to the island, while Art. II explains that this relinquishment is in consideration of the grants by Cuba to the United States of coaling and naval stations in the island of Cuba. Art. III contains provisions designed to protect the rights and privileges of American citizens resident in the island at the time of the exchange of ratifications of the treaty.

UNITED STATES-FINLAND

Extradition.—(Signed at Helsingfors, Aug. 1, 1924; ratifications exchanged, March 23, 1925; proclaimed, March 24, 1925.)

The treaty follows the usual lines of such treaties, defining the offenses for which fugitive criminals will be extradited and prescribing certain conditions with respect to surrender and trial.

UNITED STATES-NETHERLANDS

Arbitration over the Island of Palmas.—(Signed at Washington, Jan. 23, 1925; ratifications exchanged, April 1, 1925; proclaimed, April 2, 1925.)

These differences arose in consequence of uncertainty as to whether the island, situated about 50 miles southeast of Mindanao, was included in the territory ceded to the United States by Spain in 1898. The Dutch flag was flying on the island in 1906, and thereafter American and Dutch flags were alternately raised and lowered. The United States at first refused to arbitrate, possibly in view of the fact that the island possesses a strategic value in relation to the defenses of the Philippines and might become a cable and radio station. In 1924 Governor Wood conducted an investigation into the ethnological character of the inhabitants, and a report was made to the government.

The present treaty refers the decision with respect to the sovereignty of the island to the Permanent Court of Arbitration at the Hague, the arbitral tribunal to consist of one arbitrator. Failing an agreement of the two parties upon the arbitrator the President of Switzerland is to designate him. Succeeding articles lay down the procedure to be followed before the tribunal and the powers of the arbitrator. On Oct. 5, 1925, it was announced that Judge Max Huber, a Swiss, had been designated by the two countries as arbitrator.

UNITED STATES-NETHERLANDS

Smuggling of Intoxicating Liquors.—(Signed at Washington, August 21, 1924; ratifications exchanged, April 8, 1925; proclaimed, April 8, 1925.)

The treaty is identical with that concluded with Panama (see above), except for an "understanding" annexed to it providing for the possible substitution of the Permanent Court of International Justice in place of the Hague Court of Arbitration as the agency for the settlement of claims arising under the treaty, in case the United States should become a member of the former court.

UNITED STATES-RUMANIA

Extradition.—(Signed at Bucharest, July 23, 1924; ratifications exchanged, April 7, 1925; proclaimed, April 14, 1925.)

The treaty follows the usual lines, with the exception of an annexed agreement that the death penalty will not be enforced against criminals delivered by Rumania.

UNITED STATES-OTHER AMERICAN REPUBLICS

Sanitary Code.—(Signed at Havana, Nov. 14, 1924; ratification of United States deposited with Government of Cuba, April 13, 1925; proclaimed, April 28, 1925.)

The convention follows the general lines of the International Sanitary Convention, but sets up a special Pan-American Sanitary Bureau to be used for the interchange of mortality and morbidity reports.

UNITED STATES-FINLAND

Most Favored Nation.—Agreement effected by exchange of notes, according mutual unconditional most-favored-nation treatment in customs matters. Signed, May 2, 1925.

UNITED STATES-SPAIN

Commerce.—Agreement continuing in force the commercial agreement of April 26, 1924. Effected by exchange of notes, May 2, 1925.

UNITED STATES-CENTRAL AMERICAN REPUBLICS

International Commissions of Inquiry.—(Signed at Washington, Feb. 7, 1923; ratifications deposited with the Government of the United States, June 13, 1925; proclaimed, June 15, 1925.)

The convention provides for the institution of commissions of inquiry for the investigation of questions of fact which have not been adjusted by diplomacy, to be formed from a permanent list of commissioners nominated, to the number of five each by the contracting parties. The findings of the commission are not to have the force of an arbitral award.

UNITED STATES-GREAT BRITAIN

In Respect of Canada—Smuggling.—(Signed at Washington, June 6, 1924; ratifications exchanged, July 17, 1925; proclaimed, July 17, 1925.)

The treaty provides for the exchange upon request of information concerning the clearances of vessels or the transportation of dutiable cargoes across the international boundary, or in cases where there is ground to suspect an intention to smuggle goods into the United States. Provision is also made for the mutual return of stolen property, that has come into the possession of either government, for the reciprocal exchange of information concerning persons suspected of being engaged in the violation of narcotic laws, and for assistance in the conviction of such persons.

UNITED STATES-GREAT BRITAIN

In Respect of Canada—Extradition on Account of Breaches of Narcotic Laws.—(Signed at Washington, Jan. 8, 1925; ratifications exchanged, July 17, 1925; proclaimed, July 17, 1925.)

The treaty supplements earlier treaties of extradition so as to cover the offenses mentioned in the title.

UNITED STATES-GREAT BRITAIN

In Respect of Canadian Boundary.—(Signed at Washington, Feb. 24, 1925; ratifications exchanged, July 17, 1925; proclaimed, July 17, 1925.)

The treaty supplementing the treaty of April 11, 1908, provides for measures to be taken to mark the boundary line at certain points, to maintain more effective supervision of the marks already erected, and otherwise to facilitate the determination of the boundary.

UNITED STATES-GREAT BRITAIN

In Respect of Canada—Level of the Lake of the Woods.—(Signed at Washington, February 24, 1925; ratifications exchanged, July 17, 1925; proclaimed, July 17, 1925.)

The treaty provides for an International Lake of the Woods Control Board and for the maintenance of a fixed level, so as to secure to both countries the most advantageous use of the waters of the lake.

UNITED STATES-ESTHONIA

Most-Favored Nation in Customs.—(Agreement effected by exchange of notes, signed March 2, 1925; ratification by Esthonian Parliament notified to the Government of the United States, Aug. 1, 1925.)

UNITED STATES-BELGIUM, BRITISH EMPIRE, CHINA, FRANCE, ITALY, JAPAN, THE NETHERLANDS AND PORTUGAL

(Signed at Washington, Feb. 6, 1922; ratifications deposited with the Government of the United States, Aug. 5, 1925; proclaimed, Aug. 5, 1925.)

This treaty, drawn up at the time of the Washington Conference on Disarmament, 1921-1922, had received the advice and consent of the Senate to its ratification on March 30, 1922.

UNITED STATES-BELGIUM, BRITISH EMPIRE, CHINA, FRANCE, ITALY, JAPAN, THE NETHERLANDS AND PORTUGAL

Chinese Customs Tariff.—(Signed at Washington, Feb. 6, 1922; ratifications deposited with the Government of the United States, Aug. 5, 1925; proclaimed, Aug. 5, 1925.)

The ratification of this treaty, drawn up at the time of the Washington Conference on Disarmament, 1921-1922, had been advised by the Senate of the United States, March 30, 1922, and had been carried out by the President, June 9, 1923.

UNITED STATES-GERMANY

Friendship, Commerce and Consular Rights.—(Signed at Washington, Dec. 8, 1923; ratifications exchanged, Oct. 14, 1925; proclaimed, Oct. 14, 1925.)

This treaty follows the usual lines, and was drawn up to take the place of the treaty annulled by the war.

UNITED STATES-DOMINICAN REPUBLIC

Assistance of the United States in the Collection of Customs Revenues.—(To replace the Convention of Feb. 8, 1907. Signed at Washington, Dec. 27, 1924; ratifications exchanged, Oct. 24, 1925; proclaimed, Oct. 26, 1925.)

This convention, recognizing that the treaty of Feb. 8, 1907, contains provisions no longer in keeping with present needs, modifies the control of the United States over the Dominican customs so as to facilitate the refunding of Dominican debts and to provide for expenditures upon public improvements in the Dominican Republic.

INTERNATIONAL DEVELOPMENTS IN EUROPE DURING 1925 AFFECTING THE UNITED STATES

By Roland S. Morris

Recent Ambassador to Japan

Status of International Problems.—As the year 1924 came to a close the international outlook in Europe still remained uncertain and many problems potentially dangerous were unsettled. The reparation plan, submitted by the Dawes Committee on April 9, 1924, was not accepted by the allied and German governments until August 30, 1924, and on January 1, 1925, it was still a question how the plan would work out not only technically and economically but also politically. Even with reparations temporarily solved the burden of the unadjusted inter-allied debts bore heavily on the credit of the debtor nations and tended to retard them in their economic and industrial recovery.

The League of Nations Secretariat had functioned most efficiently during the year 1924 but the Protocol adopted at Geneva during the Fall of that year looking toward stronger guarantees of security as a preliminary to disarmament was deemed too drastic for immediate ratification by the several governments. Thus the year closed with the Dawes plan as the only outstanding achievement. Even here the question of the participation of the United States in the annuities under the Dawes plan was undetermined. The contribution which had been made by American citizens to the solution of the reparations problem was acknowledged and appreciated by the European nations, but political conditions in the United States indicated clearly that the American people were still unwilling to intervene through the League of Nations or otherwise in European political controversies.

The close of the year 1924 marked the accession of Senator Borah to the position of Chairman of the Senate Committee on Foreign Relations and in the early days of January, 1925, Secretary Hughes made public his letter of resignation to take effect on March 4. Secretary Hughes had won the respect and admiration of the European Government and his retirement to private life was viewed with general regret. His administration of the Department of State aimed toward a cautious but steady advance toward closer coöperation with Europe in all matters of a non-political character. The Government of the United States was officially represented at the Opium Conference which had adjourned on December 16, 1924, to reconvene on January 16, 1925. On December 9, 1924, announcement was made of the offic participation by the United St on the international confere members and non-members League of Nations for the considering the conclusion of a convention with respect to the international trade in arms, munitions and implements of war. The year 1925 thus opened with the Dawes plan in the first experimental stage, with inter-allied debts unfunded and continuing to menace the credit of European nations; with European security unrealized and the Protocol of Geneva more or less discredited; with disarmament, dependent upon security, no further advanced than it was at the conclusion of the Washington Arms Conference.

Operation of the Dawes Plan.—It will be recalled that the plan of the Dawes Committee was accepted by the Allied and German Governments on August 30, 1924. On June 17, 1925, S. Parker Gilbert, Agent General for Reparation Payments reviewed in a carefully considered statement the working of the plan during the eight months from September 1, 1924, to the end of April, 1925, and at the close of the first year of its operation he filed a more detailed report. The results of this first year are all that could have been expected and promised continued success during the next two years. The report shows that the German budget is balanced and has a surplus for the first fiscal year of $215,000,000. The currency is stabilized with an adequate gold reserve.

The first payment of $235,000,000 has been made to the agent. Of this amount, representing one billion gold marks, over $190,000,000 were secured from the proceeds of the Dawes loans and $47,600,000 were provided from the profits of the German Railway Company. Of this amount the Government of the United States received its first annual share as provided in the Paris agreement of January 10, 1925, which allowed to the United States priority payments of $13,000,000 per year for the Rhine Army costs and for general claims. 2¼ per cent. of the German payments not exceeding $10,000,000 per year, without priority.

Viewed technically and politically [illegible] plan is pronounced by those best [illegible] judge a complete success. As [illegible] pointed out in recent comments on Mr. Gilbert's report ther may be those who can still complai that Germany pays in reparation less than she is able, but no one ca now justly contend that Germany ha failed to pay the amounts for whic she is obligated.

Activities of the League of Nations.—The Secretariat of the Leagu of Nations offered additional proo during the year 1925 of the practica and valuable contribution which it i making to world coöperation. In a brief summary of this character on cannot attempt even to outline th range and variety of its interests. One can only touch on a few achievements which have either challenged the attention or elicited the official interest of the United States.

Opium Conference.—The American delegation to the Opium Conference attended the adjourned meeting on January 16, 1925, but it was soon evident that a vital divergence of opinion existed between the British delegation and the American delegation. This resulted on February 6, in the withdrawal of the American delegation as the plan submitted by the British delegates proved wholly unacceptable to the American representatives. The Conference, however, continued without the participation of the Americans and concluded a convention on February 19, which combined many admirable provisions for the international control of narcotics. The convention further authorized the creation of a central anti-narcotic Board of Control to be appointed by the League of Nations Council and for membership in which the United States and Germany were invited to name a representative.

Conference on Traffic in Arms.—On April 9, the State Department announced that the President had designated Theodore E. Burton, Hugh S. Gibson, Rear Admiral E. T. Long, Allen W. Dulles and Brigadier General H. L. Ruggles as official American delegates to the Geneva Conference on Traffic in Arms. This Conference opened on May 4 with forty-three nations represented and on June 17 a convention was signed at Geneva by representatives of eighteen countries including the United States, Great Britain, France and Japan. A Protocol was also signed regarding chemical and bacteriological warfare. The convention provides that it shall become effective four months after its ratification by fourteen States. It divides implements of war into defined classes and provides rules governing international trade in arms to meet the requirements of each class. Each State signatory to the Protocol undertakes to recognize the illegality of chemical and bacteriological warfare in the hope its prohibition may become a recognized principle of international law.

League of Nations Council.—On September 2 the Thirty-fifth Session of the Council of the League of Nations met at Geneva. Among the reports received and considered was one on the interesting subject of survivals of slavery in the world; another on the settlement of Greek refugees; another on financial conditions in Austria-Hungary—the latter under the administration of that most able American, Jeremiah Smith; and not the least important the exceedingly embarrassing dispute over the Mosul boundary.

League of Nations Assembly.—The Sixth Assembly of the League met and elected as President a representative of the Dominion of Canada—Senator Raoul Dandurand. Paul Painlevé of France struck the dominant note of the gathering in his opening address by insisting that the problem of disarmament must await some effective agreement guaranteeing security.

The Assembly sat from September 7 to September 26. The negotiations centering around security dominated the atmosphere in which the Assembly met and no far-reaching decisions were possible until these negotiations were concluded. All observers seemed to agree, however, that the Assembly in its deliberations showed greater self-confidence, poise and efficiency than at any time in the history of the League.

In the actual work of the Assembly the United States, of necessity, played no part. There were, however, private contributions such as the grant of the Rockefeller Foundation for the League's health work; the successful efforts of Jeremiah Smith, already referred to, as High-Commissioner for Hungary; and the devoted service of Charles P. Howland as President of the Greek Refugee Settlement Commission.

One must turn to the detailed reports to appreciate the immense amount of work which the League has accomplished in all lines of international effort. It is the problem of European security as it could be worked out in and through the League which has commanded throughout the year 1925 unusual interest in the United States. And so we turn to—

EUROPEAN SECURITY AND THE LOCARNO AGREEMENTS

British Invitation.—The Geneva Protocol of 1924 indicated that the nations of the world "had lifted themselves to a new level," but to the practical-minded statesmen of Europe it seemed too radical a change to be immediately effective. It was not, however, until March 12 that the British Government definitely announced its position. On that date the British Foreign Secretary made a statement, the substance of which is contained in the following brief paragraph:

> Since the general provisions of the Covenant cannot be stiffened with advantage and since the extreme cases with which the League may have to deal will probably affect certain nations or groups of nations more nearly than others his Majesty's Government concludes that the best way of dealing with the situation is with the coöperation of the League to supplement the Covenant by making special arrangements in order to meet special needs.

Following this on March 24 the British Foreign Secretary in a statement to the House of Commons concerning the diplomatic negotiations said:

> I would outline the German suggestion as follows: Germany's interest is in the establishment of a special treaty foundation for a peaceful understanding with France. Ge
> many is prepared to consider a comprehen
> arbitration treaty and to enter into a
> pact with the powers interested in the
> Similar arbitration treaties may be
> with other States which have cor
> daries with Germany. If those

a further pact universally guaranteeing the present territorial status on the Rhine would be acceptable to Germany and the pact may further guarantee fulfillment of Articles 42 and 43 of the Treaty of Versailles.

Attitude of the Council.—During April and May diplomatic exchanges continued in the hope of reaching some agreement which would remove the fears of France, satisfy the German Government and be acceptable to the Powers less directly concerned. The needs of the situation were accentuated by the note which the Council of Ambassadors presented to Germany on June 4. After referring to the note of the previous January it pointed out "the numerous defaults of the German Government" which, "if not properly rectified would in the aggregate enable the German Government eventually to reconstitute an army moulded on the principle of a nation in arms."

Preliminaries.—This was followed on June 18 by the publication of a British White Paper, and a debate in the House of Commons on June 21 revealed to the public that progress toward a preliminary understanding was being made. Notes were exchanged between France and Germany during June and July, and on August 10 the British Foreign Secretaries conferred in London. This Conference was followed by a note to Germany made public on August 26 and embodying the French and British views.

On September 1 a conference of experts representing Great Britain, France, Germany, Belgium and Italy met at London and preliminary drafts of a security pact were submitted and discussed. It was in the midst of all these protracted negotiations that the Assembly of the League of Nations met, and as previously pointed out, the atmosphere was vibrant with coming events. The Conference of experts in London held some eight sessions and then adjourned to report to their govern- ents whose leading representatives gathered at Geneva.

ting at Locarno.—On October ying the adjournment of the of the League of Nations the Foreign Secretaries and other leading representatives of the German, Belgian, British, French, Italian, Polish and Czechoslovak Governments met in historic conference at the town of Locarno in Switzerland and after ten days of frank exchange of views and adjustment of differences united in common agreement as to "the means for preserving their respective nations from the scourge of war and for the providing for the peaceful settlement of disputes of every nature which might eventually arise between them."

Final Act.—On October 16 the Final Protocol, the Security Pact and the other Agreements were duly initialed by the respective representatives and submitted to the governments for ratification. They were all duly ratified and on December 1 the plenipotentiaries gathered in the Foreign Office at London and with a characteristic touch of modernism in the face of "movie" cameras formally executed them. As a final act a telegram was sent to the Mayor of the little town of Locarno, thus rescued from comparative oblivion, thanking him for the community's gracious hospitality.

The Documents. — The Locarno Agreements viewed in their technical diplomatic aspect consist of "The Final Protocol" with five treaties or conventions and a collective note to Germany attached. The first is a Treaty between Germany, Belgium France, Great Britain and Italy ("The Security Pact") designated "Annex A"; the second is an Arbitration Convention between Germany and Belgium designated "Annex B"; the third is an Arbitration Convention between Germany and France designated "Annex C"; the fourth is an Arbitration Treaty between Germany and Poland designated "Annex D"; and the fifth is an Arbitration Treaty between Germany and Czechoslovakia designated "Annex E." The significance of these documents will be determined by their operation in the years to come. It will be sufficient to quote from "The Final Protocol" the following statement ratified by the Governments concerned as the considered expression of the object which they seek to accomplish through the Treaties:

> The representatives of the Governments represented here declare their firm conviction that the entry into force of these treaties and conventions will contribute greatly to bring about a relaxation of the moral tension between nations, that it will help powerfully toward the solution of many political and economic problems in accordance with the interests and sentiments of peoples and that in strengthening peace and security in Europe it will hasten on effectively the disarmament provided for in Article 8 of the Covenant of the League of Nations.

STEPS TOWARD DISARMAMENT

Invitation to a Conference.—The Treaties of Locarno had in view immediate steps for world-wide disarmament and the formal execution of the Treaties at London on December 1 was promptly followed by action by the Council of the League of Nations. The thirty-seventh meeting of the Council was held early in December and under authority of a resolution of the Assembly adopted in September the Council put in motion the machinery for the calling of a World Conference on disarmament. An examination was made of the work of the subcommittees of the League of Nations which have been working for a considerable period to lay the ground-work for such a complicated world enterprise. It was decided by the Council to convoke a special disarmament committee to meet at Geneva on February 15, 1926, to clear the way and to prepare practicable suggestions for the consideration and action of an International Disarmament Conference to be held later under the auspices of the League of Nations. Invitations were promptly issued to members and non-members of the League of Nations to attend this preliminary conference. The invitation extended to the United States is now before President Coolidge awaiting his action.

INTER-ALLIED DEBTS

Relation to Reparations.—For several years the subject of inter-allied debts had been linked up with the problem of reparations. The adoption of the Dawes plan in 1924 snapped this link and left the debts to be dealt with separately. It will be recalled that the Dawes plan was submitted on April 9, 1924, and went into operation on September 1 of that year. It was not, however, until May 16, 1925, that the Government of the United States issued an informal statement covering the progress which had been made in the adjustment of the debts due by the states of Europe to the United States. From this statement it appeared that of the fourteen nations which had borrowed from the United States during the World War and subsequent to the Armistice five, viz.: Great Britain, Hungary, Finland, Lithuania and Poland had completed funding arrangements with the American Debt Commission. It was pointedly suggested that the remaining nine should consider definite arrangements for similar adjustments. The nations thus called upon were:

France	owing.....	$3,924,867,744.17
Italy	"	2,080,780,147.21
Belgium	"	459,919,945.04
Greece	"	16,468,846.66
Roumania	"	44,451,166.95
Czechoslovakia	"	117,374,917.61
Jugoslavia	"	64,058,338.68
Esthonia	"	17,794,020.28
Latvia	"	6,225,873.26

It was further announced on June 1 that debt funding negotiations would be welcomed in Washington but under no circumstances would the American Debt Commission consider going abroad. During the sessions of the third Congress of the International Chamber of Commerce held at Brussels from June 21 to 26 a tendency again developed to view the inter-allied debts thus made as linked with reparations and dependent on the successful operation of the Dawes plan.

American Attitude. — John W. O'Leary, President of the Chamber of Commerce of the United States, presented with singular ability the American point of view. "He repudiated the implication that the United States was seeking to profit by the distress of Europe, declared that the prosperity of the United States was bound up with the prosperity of the rest of the world and insisted that the first step in the restoration of international confidence was the assurance that the financial obligations of nations would be met. The resolutions finally adopted expressed confidence in the Dawes plan as the most constructive development of the period under review and reaffirmed the declaration of the previous Rome conference that 'while it is true the allied debts created by the World War are obligations undertaken in good faith and do not admit of repudiation, nevertheless as they were contracted in the common cause in a period of tremendous sacrifice of life and property the proper factor for any adjustment should be the present and probable future ability of each debtor to pay.'" This resolution appears to have expressed accurately the policy of the American Government in approaching the debt settlements and also reflected the attitude of responsible American interests.

Preparations for Conferences.—During the summer and fall events moved rapidly. From June 25 to June 30 preliminary discussions were held in reference to the Italian debt. On June 26 there was a preliminary conference on the debts of Jugoslavia. On June 30 the French Cabinet decided to proceed with the funding of the French debt to the United States. On the same date the Department of State announced that the Belgian debt commission was due in August. July 7, announcement was made that Czechoslovakia would proceed at once with the United States debt negotiations. August 18 agreement was reached on the funding of the Belgian debt. The entire debt of $727,830,500 was divided into pre-armistice and post-armistice debt the latter amounting to $556,050,500 to be paid in annual installments extending over sixty-two years with interest at 3½ per cent. The pre-armistice debt constituting the balance was also to be paid in sixty-two installments but interest was to be remitted. August 24, negotiations in London on the French debt to Great Britain resulted in an agreement to pay £633,000,000 in annual installments of £12,500,000 r sixty-two years, *but* with a proviso that Great Britain "must receive from France proportionate and *pari passu* payments to any she may eventually make to the United States in settlement of her war debt."

Conference with France.—A month later (Sept. 2), the French Debt Commission met the American Debt Commission for the first time. The negotiations roused great public interest because of the presence of the French Finance Minister M. Caillaux whose vivid personality and dramatic career added the needed touch of color to what was otherwise the drab discussion of figures and facts. Negotiations were continued until October 3 when the French Commission sailed for home, the chairman, M. Caillaux, bearing with him an offer of the American Commission to accept $40,000,000 annually for five years as interest in full on present principal and accrued interest of the debt with the understanding that at the end of five years the debt question should be reopened. This offer was subsequently refused by the French Government and so as the year 1925 closes the French debt remains unadjusted and French credit has suffered a temporary setback.

Czechoslovakian Agreement.—On October 9 the Czechoslovakian war debt was adjusted on the basis of $115,000,000 payments to be spread over the now familiar period of sixty-two years. This was followed on October 28 by the settlement of the Esthonian debt on the basis of a cash payment of $1,441.88 and the balance of $13,830,000 to be paid in annual amounts for the same conventional period of sixty-two years.

Italian Agreement.—On November 2 after negotiations lasting for ten days a singularly lenient agreement was reached on the Italian debt which was signed on November 14. The debt was fixed at $2,042,199,466.34, of which $199,466.34 was to be paid at once and the remainder was funded at specified rates of interest in order to bring the total payments at the end of sixty-two years to $2,407,000,000. With the funding of the Latvian debt and the delivery by the Lithuanian Government of $6,000,000 in Lithuanian bonds to the United States the American Debt Commission could look back on a year of earnest effort which gave promise of fruitful results in the reconstruction of European finance. All of the debt agreements are now before Congress for ratification.

Summary.—President Coolidge in his message to Congress thus summed up the present state of the debt settlements:

> Those made with Great Britain, Finland, Hungary, Lithuania and Poland have already been approved by the Congress. Since the adjournment, further agreements have been entered into with Belgium, Czechoslovakia, Latvia, Esthonia, Italy and Roumania. These eleven nations, which have already made settlements, represent $6,419,528,641 of the original principal of the loans. The principal sums, without interest, still pending are the debt of France, of $3,340,000,000; Greece, $15,000,000; Jugoslavia, $51,000,000; Liberia, $26,000; Russia, $192,000,000, which those at present in control have undertaken openly to repudiate; Nicaragua, $84,000, which is being paid currently, and Austria, $24,000,000, on which by act of Congress a moratorium of 20 years has been granted. The only remaining sum is $12,000,000, due from Armenia, which has now ceased to exist as an independent nation.

THE WORLD COURT

Official Report.—August 15, 1925, the Permanent Court of International Justice issued the first volume of a new series of official publications to be known hereafter as "Series E" and which is intended to consist of an annual report of the Court's activities. The Court decided "that the volume to be issued on August 15, 1925, should cover the whole of the Court's activities from January, 1922, up to June 15, 1925, and that subsequent volumes should cover the twelve months' period finishing on June 15 each year." There is thus available to anyone desiring a summary of the personnel, rules, opinions and decisions of the Court a carefully prepared official volume containing all the desired information.

Judges.—In noting the development of the Court and of its activities during the year 1925 it is interesting to observe that of the fifteen Judges and Deputy Judges now qualified ten are from European countries as follows: Spain, Italy, Great Britain, Switzerland, Holland, Denmark, France, Norway, Roumania and Jugoslavia; one is from South America; one is from Cuba; one is from the United States; one is from Japan and one from China.

Summary of Sessions.—The Sessions and the character of the cases submitted to the Court are thus briefly stated in the Introduction to the Court's Summary of Judgments and Opinions set forth in the first Annual Report:

> The Court met for the first time from January 30th to March 24th, 1922. At this session, which was called a 'preliminary' session, the Rules of Court were prepared. The first ordinary Session, which began on June 15th, 1922, ended on August 12th of that year. It was devoted to the preparation of Advisory Opinion No. 1, regarding the appointment of the Dutch Workers' Delegate to the third International Labour Conference, and of Advisory Opinions Nos. 2 and 3 regarding the competence of the International Labour Office in agricultural matters. The second (extraordinary) Session held from January 8th to February 7th, 1923, was convened for the purpose of giving an opinion on the Nationality Decrees in Tunis and Morocco (French Zone) promulgated on November 8th, 1921. At the third (ordinary) Session (June 15th, 1923, to September 15th, 1923) the Court dealt with the 'Wimbledon' case, its first judgment; it also gave a reply to Request No. 5, for an advisory opinion in regard to the status of Eastern Carelia, and delivered Opinions No. 6, concerning the German settlers in Poland, and No. 7, concerning the acquisition of Polish nationality. The fourth (extraordinary) Session, held from November 12th to December 6th, 1923, was devoted to Advisory Opinion No. 8 concerning the question of the delimitation of the Polish-Czechoslovak frontier (the Jaworzina question). At the fifth (ordinary) Session (June 16th, 1924, to September 4th, 1924), the Court delivered Judgments No. 2, concerning the Mavrommatis Palestine Concessions (the question of jurisdiction), and No. 3, concerning the interpretation of paragraph 4 of the Annex following Article 179 of the Treaty of Neuilly. During the sixth (extraordinary) Session (January 12th, 1925, to March 26th, 1925) the Court gave a judgment (No. 4) in regard to the interpretation of Judgment No. 3, and also Judgment No. 5, in regard to the Mavrommatis Jerusalem Concessions, which had been reserved under Judgment No. 2 for decision on the merits; it also delivered Advisory Opinion No. 10 in regard to the exchange of Greek and Turkish populations. The seventh (extraordinary) Session (April 14th to May 16th, 1925) was devoted to Advisory Opinion No. 11, concerning the Polish postal service at Danzig.

Addition of Documents.—A study of the above summary will reveal the variety and the importance of the questions which have been submitted to the Court since it first met for organization on January 20, 1922. In addition to the *Annual Report* the Court issues from time to time as official publications *Collection of Judgments* (Series A); *Collection of Advisory Opinions* (Series B); *Acts and Documents Relating to Judgments and Advisory Opinions Given by the Court* (Series C); *Acts and Documents concerning the organization of the Court* (Series D) and finally the *Annual Reports of the Court* to be known as Series E.

Bases of the World Court.—In Series D among the Acts and Documents of the Court is a volume (No. 4) which is of great significance to the student and observer of the development of international justice as a substitute for force. This volume 4 of Series D consists of extracts from international agreements affecting the jurisdiction of the Court. It is indeed impressive to note how the Court has been in the minds of statesmen and Foreign Offices as the obvious recourse in the event that differences cannot be composed in the ordinary course of diplomatic negotiation. It is the compulsory jurisdiction of the Court voluntarily accepted in numberless treaties and agreements between states which justifies the hope of its increasing influence. Any one who seeks to judge justly the present value and future influence of the Permanent Court should study carefully the previously published extracts and the Addendum in this first Annual Report.

Extract of Jurisdiction.—As typical provisions of these very recent agreements note Article VII of the Commercial Convention between Czechoslovakia and the Netherlands which provides (*Report* page 392), "Any dispute in regard to the interpretation, application or execution of the present Convention which cannot be settled between the High Contracting Parties by the diplomatic channel shall be submitted to the Permanent Court of International Justice." Or again as another type note Article 6 of the Treaty of Defensive Alliance between Esthonia and Latvia which provides (*Report* page 393) "All disputed questions which may arise between the High Contracting Parties and which cannot be settled by diplomatic means shall be laid before the Court of International Justice or submitted to international arbitration."

Reservation by the United States.—Of particular interest to American citizens is the exchange of notes which took place between the American and Dutch Governments on the day of the signing of the Convention respecting the regulation of the liquor traffic. This exchange was to the effect (to quote the Court's note at page 204 of the Report) "that in the event of the adhesion of the United States to the Protocol of December 16, 1920, under which the Permanent Court of International Justice was created at the Hague, the United States Government would not be averse to considering a modification of the said Convention or the making of a separate agreement providing that claims mentioned in Article IV of that Convention which cannot be settled in the way indicated in the first paragraph of that article shall be referred to the Permanent Court of International Justice instead of the Permanent Court of Arbitration."

Movement in the United States.—The year 1925 is also marked by a growing sentiment among the people of the United States that their government should adhere to the Protocol establishing the Court with the Harding-Hughes reservations. As early as March 3, 1925, this sentiment found expression in a Resolution of the House of Representatives voicing its cordial approval of the Court, its earnest desire that the United States should give early adherence to the Protocol and expressing its readiness to participate in such legislation as will necessarily follow. The earnest desire thus expressed is shared by President Coolidge and in the closing days of 1925 the debate on the World Court was well under way in the Senate with all signs pointing to our early adherence.

UNOFFICIAL CONGRESSES AND CONFERENCES

American Travel to Europe.—No study of European affairs and their effect on American life and interests would be complete without a brief reference to the increasing personal contacts and associations between the peoples of Europe and the United States observable during the past year. Travel of Americans to Europe assumed unprecedented proportions. It was not confined to the conventional summer tourist but continued during the fall and winter months. Many as usual were bent on sightseeing and relaxation but large numbers traveled abroad for serious study and observation. The effects of this American exodus to Europe on the manners and outlook of the American people cannot as yet be adequately measured. Accompanying this movement were many unofficial international gatherings which met in various parts of Europe to exchange views on common interests and problems. Thus the World Federation of Educational Associations met at Edinburgh on July 19, the International Council of Nurses at Helsingfors on July 23; the World Alliance for International Friendship through the churches at Stockholm on August 6; the Institute of International Relation at Geneva on August 9; the Universal Church Congress on August 19; the Labor and Socialist International on August 22; and the First Child Welfare Congress closed at Geneva on August 28, while the International Telegraph Congress opened on September 1.

European Travel to the United States.—Nor is this movement all one way. The Institute of Politics, at Williamstown, again gathered a group of earnest students to discuss world affairs under the leadership of European scholars and statesmen. On October 1 the Interparliamentary Union met at Washington and brought to the United States many distinguished representatives of European countries.

Significance of the Year.—As the year 1925 passes from the contemporary chronicles into the jurisdiction of the historian it is not unlikely that it will mark a significant date in the progress of the world. The continuing success of the Dawes plan, the increasing and internationally helpful influence of the League of Nations, the Locarno Treaties, the definite and practical steps which the League has taken moving toward world disarmament, the inter-allied debt settlements and the consequent reëstablishment of European credits, the widening jurisdiction of the World Court and its growing prestige and the enlarging personal and social contacts between the peoples of differing nationalities all combine to renew our confidence in a world steadily and surely moving toward an organized peace.

LATIN-AMERICAN RELATIONS

By Graham H. Stuart

Associate Professor of Political Science, Stanford University

---

PAN-AMERICAN RELATIONS

Hughes' Declaration. — The year opened with an auspicious keynote sounded by Secretary of State Charles E. Hughes in his radio address of January 20, 1925, on the relations of the United States with Latin-America, when he declared: "We wish to have prosperous and independent neighbors with whom we can deal in peace to our mutual advantage. We harbor no thought of aggression upon anyone. . . . Our historic policy which we call the Monroe Doctrine is itself designed to thwart measures of aggression." Nor were these words merely sonorous phrases tuned to the occasion. The withdrawal of the marines from the Dominican Republic in September, 1924, the promise to withdraw from Nicaraugua early in 1925, and from Haiti as soon as internal peace and stability seemed assured, proved the sincerity of the intentions.

Other factors contributed to the expectation of an increase in the spirit of cordiality and coöperation between the United States and the Latin American republics. Mexico was again on friendly diplomatic relations with Washington; and Chile and Peru, through the good offices of the United States, were on the road to a settlement of their long contineud feud over the Tacna-Arica provinces.

Pan-American Conferences.—If as the year progressed the diplomatic horizon became somewhat overcast, the outlook was kept bright by the continuous efforts for Pan-American solidarity and the successful results of many Pan-American conferences.

The third Pan-American Scientific Congress held meetings at Lima, Peru, from December 20, 1924, till January 6, 1925; conjointly with it a Pan-American Conference on Uniformity of Specifications, and the second Pan-American Conference of Women. The Pan-American Highway Conference was held at Buenos Aires in May; and the Pan-American Educational Conference took place at Santiago, Chile, in September.

The conventions of some previous conferences were made effective in 1925. On February 23 the United States Senate ratified the Pan-American Sanitary Code which had been signed by the representatives of eighteen American republics at Havana on November 14, 1924; and the following day ratified the Inter-American Trade Mark Convention, signed by eighteen republics at Santiago, Chile, April 28, 1923.

Mexican Land Controversy.—On November 30, 1924, General Plutarco Elias Calles was inaugurated president of Mexico for four years, at a joint session of the Mexican Congress. A hearty cablegram of congratulations from President Coolidge was an augury of friendly relations between the two neighbors. Less than a month later Señor Manuel C. Tellez after a long and successful diplomatic career in Canada, Japan, and China was appointed ambassador to the United States. The appointment of James R. Sheffield as our ambassador to Mexico was confirmed January 25, 1925.

The principal problem facing the new administration in Mexico was the land question. The land law of 1915 passed by the Carranza régime, but not put into effect until Obregón became president, permitted villages to receive land to the extent of approximately 12½ acres for each male citizen. The owners of land so appropriated and distributed were to be paid by government bonds and at a price 10 per cent. above the assessed valuation. Large transfers of such lands were made by President Obregón, and President Calles continued that program.

Unfortunately the dispossessed owners found it impossible to realize immediately upon the securities exchanged, and their future value was somewhat uncertain. Some Americans among those owners appealed to the government of the United States to protect their interests. Ambassador Sheffield was summoned to Washington to confer with President Coolidge and Secretary of State Kellogg; the latter, in a communication to the press (June 12) declared that conditions in Mexico were unsatisfactory, and that the United States expected Mexico to indemnify Americans for property illegally taken. "The government of Mexico is now on trial before the world and the American government will continue to support the government of Mexico only so long as it protects American lives and rights and complies with its international obligations."

Reaction of Mexico.—In reply President Calles declared, June 14, that "the statement that the government of the United States will continue to support he government of Mexico only so long as it protects American interests and lives, and complies with its international obligations, embodies a threat to the sovereignty of Mexico that she cannot overlook and rejects with all energy." He then intimated very clearly that Mexico wished to be permitted to solve her domestic problems in her own way.

The spirited rejoinder of President

Calles seemed to meet with almost unanimous approval among Mexican political leaders, and ex-president Obregón, and Secretary of Industry and Commerce, Luis Morones, the leader of the labor forces, congratulated him warmly. The repercussion spread to South America, and the Latin American Union from its headquarters at Buenos Aires declared that Secretary Kellogg's statement showed "that want of respect for the sovereignty of our peoples which is characteristic of the White House" and extended to President Calles "its warmest sympathy." In the United States the exchange of public statements was criticized chiefly on account of the violence done to the ordinary canons of diplomatic procedure. It was felt that friendly governments ought to make their protests first through the ordinary diplomatic channels rather than by public declarations. For whatever reason, in his message to Congress, read at its opening on September 1, President Calles announced that cordial relations had been restored.

Waters of International Rivers.—Except for this rather spectacular diplomatic flurry the relations between the two countries were continuously friendly. In January, President Coolidge designated three special commissioners to coöperate with representatives of Mexico in a study regarding the equitable use of the waters of the Rio Grande south of Fort Quitman, Texas. The United States also proposed to offer Mexico water for irrigation in exchange for affecting the flow of the Colorado River by erecting Boulder Canyon Dam. Negotiations proceeded favorably between the two countries towards an agreement to abolish drug smuggling across the international boundary.

Debt Refunding.—In his message to the Congress on September 1, President Calles recommended that the Lamont—de la Huerta Mexican debt refunding agreement of 1922 be modified, and Finance Minister Pani came to New York to secure the desired modifications. A new arrangement was drawn up and approved by President Calles and his cabinet on November 11, which takes care of the arrears for 1924 and 1925 and begins a new schedule of payments on January 1, 1926.

RELATIONS WITH THE CARIBBEAN COUNTRIES

Cuba.—An outstanding event in the diplomatic relations between the United States and Cuba was the approval by the United States Senate, March 13, 1925, by a vote of 63 to 14, of the Isle of Pines Treaty relinquishing in favor of Cuba all claim of title to the island. The island by the Platt Amendment was omitted from the constitutional boundaries of Cuba, and its title left to future adjustment by treaty. Such a treaty was signed July 2, 1903; since it was not acted upon, a new treaty almost identical in terms was signed March 3, 1904. Although its passage was recommended by several Presidents and Secretaries of State of the United States, and on three occasions the Senate Committee on Foreign Relations reported it favorably, consent to ratification was not obtained until almost twenty-three years after signature. Inasmuch as the Cuban government had been exercising jurisdiction over the island throughout this period, the belated action of the Senate merely made *de jure* the existing *de facto* situation.

With a view to better mutual understanding and more friendly coöperation, President-elect Gerado Machado y Morales visited the United States in April, 1925, and was cordially received by President Coolidge and Secretary Kellogg. In one of his public addresses, the visitor declared that he intended to come back after completing his term of office, and seek the aid of the United States to get rid of the Platt Amendment. The sentiment of the President-elect was well received by the press of Cuba.

Santo Domingo.—In the Dominican Republic a detachment of United States Marines had been maintained since 1916. A new condition was brought about by the withdrawal of the last of the marines in September, 1924. The situation was legalized by the Senate's consent to the agreement January 20, 1925. At the same time a new loan convention was approved, to take the place of that contracted under President Roosevelt's famous convention of 1907. As the loan would soon be paid off the new agreement provides a $25,000,000 loan to refund all outstanding bonds and create a surplus of $10,000,000 for immediate public improvements. The only American official retained under the new convention is the general receiver of customs. Although a so-called Pact of Honor was organized in the Dominican Chamber of Deputies against accepting the new agreement, the convention was duly approved, May 25, 1925.

Haiti.—In Haiti the United States still maintains a brigade of marines under the command of the American High Commissioner, General John H. Russell. In his annual report, January 1, 1925, General Russell commented favorably upon conditions there. Public order is now largely under the control of the *gendarmerie d'Haiti*, and excellent progress has been made in railway construction and irrigation projects. Dr. George C. Payne of the Rockefeller Foundation was engaged in a medical survey; and Dr. George F. Freeman was aiding in the establishment of a Central School of Agriculture, and vocational, industrial and rural farm schools.

In his latest report, Dr. W. W. Cumberland, Financial Advisor-General Receiver of Haiti, announces a gratifying improvement in trade during the past three years with an excess of exports over imports and expenditures maintained well within receipts.

Central America.—Nicaragua has just given a striking example of the potent influence of American soldiers on the spot. A force was placed there in 1912 nominally as legation guards. When it was planned to withdraw them in January, 1925, at the express request of President Solorzano they were permitted to remain until August when, it was hoped, the Nicaraguan constabulary would be sufficiently well organized to maintain order. Hardly had the marines departed before Ex-President Chamorro began a revolution to restore the Conservative party to power. He was so successful that President Solorzano agreed to appoint him Commander in Chief of the army, backed by a Conservative cabinet. The Liberal party has asked that the United States send back the marines.

Republic of Panama.—The Panamanian government also asked that the United States intervene to maintain order in Panama City during October. Riots seem to have been incited by agitators for lower rents. About 600 American soldiers were sent on October 12, and the sight of bayonets and machine guns was sufficient to restore order. All American troops were back in the Canal Zone by October 23.

RELATIONS WITH SOUTH AMERICA

Tacna-Arica Arbitration. — The only serious diplomatic problem between the United States and the South American republics in 1925 was the attempt to settle the Tacna-Arica dispute between Peru and Chile. The ownership of this territory should have been settled by a plebiscite in 1894, ten years after the ratification of the Treaty of Ancon; it has been called the Alsace-Lorraine of South America. President Harding offered his good offices in 1922, and Peru and Chile agreed to allow the President of the United States to determine whether or not the plebiscite should at last be held. President Coolidge accepted the position of arbitrator after President Harding's death, and handed down his decision March 4, 1925, declaring that the plebiscite should be held.

The award was bitterly criticized in Peru; April 2, the Peruvian ambassador at Washington handed a memorial to the State Department contending that the judgment was unfair, and asking for additional guarantees to its proper carrying out. President Coolidge replied immediately insisting that the award remain unchanged.

The plebiscite was to be supervised by a commission of three—a Chilean, a Peruvian, and an American presiding officer. President Coolidge appointed General John J. Pershing as the American member, Chile appointed Señor Augustin Edwards, and Peru named Dr. Manuel de Freyre Santander. At the first formal meeting of the Plebiscitary Commission in Arica, August 5, General Pershing assured the inhabitants that every qualified voter would have an opportunity to cast his vote freely and have it fairly counted.

The Commission had scarcely made a survey of the ground before complaints were made by the Peruvians against Chilean attempts to hinder a fair vote. Hostility towards the American intention of carrying out the award in accordance with its letter and spirit was soon evident among the Chilean population. General Pershing was finally forced to ask for the removal of the Chilean military garrison, a reduction of the police force, and various other changes, in order to obtain a free vote. Although his demands were approved by the Commission, November 2, new difficulties soon arose; November 21, Señor Edwards withdrew from the Commission, declaring his instructions compelled him to abstain "from all proceedings except those relating strictly to registration and voting."

The shooting of a Chilean carabineer and the accusation made by the Chilean commander that the members of the Peruvian Boundary Commission were responsible threatened the disruption of that board also. Except for the return to Peru of the province of Tarata made on September 1, the ultimate carrying out of the award seems in a rather doubtful situation—particularly since the Chileans have practically demanded the elimination of Pershing.

Brazil.—The members of the American naval mission to Brazil returned in February, 1925, after two years' work. In a statement made by Commander Beauregard it was emphasized that the purpose of the American mission was not to persuade the Brazilians to build more ships, but to bring the Brazilian navy into line with the highest standards of efficiency now prevailing. As a result of the acceptance by Brazil, Peru and Colombia of the good offices of Secretary Hughes, a settlement of their boundary difficulties in the Amazon region was effected in the State Department on March 4, 1925.

The recent coffee policy of Brazil has not been entirely satisfactory to American merchants; and American bankers noting Secretary Hoover's stand in November against foreign government's control of prices in certain commodities have been unwilling to extend loans for the coffee valorization scheme.

AMERICAN INTERESTS IN MEXICO

Attention of Mexico Requested.—June 30 Secretary of State Kellogg made a statement to the press which drew a sharp retort from President Calles of Mexico. The statement was issued on the strength of a report on conditions in Mexico presented to the Secretary by Ambassador Sheffield; and it recited that two joint claims commissions were sitting and would in due time adjudicate claims of American citizens for properties illegally taken by Mexico and for personal injuries to American citizens.

Our relations with the Mexican Government were friendly, it was said; but while conditions had improved they were nevertheless "not entirely satisfactory" and we were looking to and expected the Mexican Government to restore properties illegally taken and to indemnify American citizens.

Attention was called to the rumors of a new revolutionary movement in Mexico, and it was pointed out that, while it was the policy of the United States to use its influence "in behalf of stability and orderly constitutional procedure" it should be made clear that the United States would continue to support the existing Government only so long as it protected American lives and American rights. "The Mexican Government," it was said, "is now on trial before the world," and while we had been patient we could not countenance violation by Mexico of its international obligations.

Mexico Irritated.—June 14 President Calles, using the same indirect form of communication, replied in sharp terms, designating Secretary Kellogg's statement as "a threat to the sovereignty of Mexico which she cannot overlook" and repudiating any right on the part of a foreign country "to intervene in any form in her domestic affairs." He then cited the various claims conventions concluded by Mexico as the "best proof that Mexico is willing to comply with her international obligations." If, it was said, the Mexican Government "is now on trial before the world, such is the case with the government of the United States as well as all those of other countries." In the sense of Mexico being on trial in the guise of a defendant, the imputation was rejected as an insult.

Effect of the Constitution of 1917.—Among the causes of the controversy was the fact that President Calles had issued in January a presidential decree advising the Mexican states of their authority to put into effect certain "seizure" features of the agrarian laws passed in pursuance of Art. 27 of the Mexican Constitution of 1917, provided compensation be made. With the reply of President Calles the immediate controversy died out as quickly as it had flared up.

Conference with Mexico.—A joint commission of representatives of the United States and Mexico met at El Paso, Texas, May 15, to open negotiations looking to the conclusion of a treaty for the prevention of drug smuggling and for the regulation of other matters of common interest along the border. Lincoln C. Andrews, Assistant Secretary of the Treasury of the United States, presided as Chairman of the joint commission. It appointed four committees to report to it upon the following questions: (1) all phases of smuggling; (2) migration and deportation problems; (3) hunting and fishing and health problems; (4) extradition and international procedure.

The reports of the four committees were presented to the joint commission on May 23. The recommendations of the commission were withheld until a formal convention could be drawn up, but on May 30 Chairman Andrews announced in Washington that the terms of the proposed treaty were stronger and broader than the treaty concluded with Canada at Washington, June 6, 1924. It was announced at the State Department (October 15) that a convention had been agreed to "in general terms," but that certain modifications were desired by both parties before it was submitted to them for ratification.

Mixed Claims Commissions.—Following closely upon the recognition by the United States of the Obregon Government in Mexico on Aug. 31, 1923, two Claims Conventions were signed, one on Sept. 8 relating to General Claims, the other on Sept. 10 relating to Special Claims. The two conventions were duly ratified and came into force upon the exchange of ratifications, March 1 and Feb. 19, 1924, respectively.

Aug. 22, 1924, the Special Claims Commission, consisting of Dr. R. Octavio, Presiding Commissioner; Hon. E. B. Perry, Commissioner for the United States, and Hon. G. Roa, Commissioner for Mexico, adopted a body of Rules and Regulations which were amended in January, 1925. After having received with it about 200 claims, the Special Claims Commission, which is to deal with losses or damages suffered by American citizens through revolutionary acts within the period Nov. 20, 1910, to May 31, 1920, inclusive, adjourned to meet in Mexico City the first week of January, 1926.

The General Claims Commission, which is to deal with all other claims of the citizens of each country against the other except those arising from revolutionary disturbances in Mexico, consists of Hon. C. van Vollenhoven, Presiding Commissioner, Hon. Nathan Miller for the United States and Hon. G. Fernandez MacGregor for Mexico. Sessions were held in Washington beginning June 2, and after completing the preliminary work connected with the filing of claims and the preparations for their presentation the Commission adjourned to meet in Washington the first Monday in February, 1926.

ARBITRATION OF THE TACNA-ARICA CONTROVERSY

Award.—President Coolidge rendered his award as arbitrator March 4, 1925, in the long-standing dispute between Chili and Peru with respect to the provinces of Tacna and Arica. His assumption of that task had been in response to a protocol of July 20, 1922, by which Chili and Peru, after reciting their inability to reach an agreement upon the unfulfilled provisions of Art. 3 of the Treaty of Peace of Oct. 20, 1883, submitted the questions at issue to the arbitration of the President of the United States who was to "decide them finally and without appeal."

Basis.—The Treaty of Peace known as the Treaty of Ancon (1881), provided that the two provinces, which had been taken possession of by Chili during the war which broke out in 1879, should continue in her possession during a further period of ten years and that "after (upon, on) the expiration of that term" a plebiscite should decide whether the two provinces should belong to Chili or Peru. The state to which the provinces should be assigned was to pay ten million pesos to the other. A special protocol was to prescribe the manner in which the plebiscite was to be carried out.

Plebiscite Prescribed.—The first question was whether under the existing circumstances a plebiscite should or should not be held. Upon this point the arbitrator decided that in spite of the lapse of time the provisions of Art. 3 of the Treaty of Ancon were still in effect and that the plebiscite should be held. No proof of bad faith on the part of Chili was found in respect to failure of the two parties during so many years to agree upon the terms of the protocol fixing the conditions of the plebiscite. The next question was to determine the conditions under which the plebiscite should be held, and on this point the arbitrator laid down specific rules defining the persons qualified to vote, providing for supervision of the plebiscite by a special Plebiscitary Commission and for the appointment of Registration and Election Boards, fixing the time of the plebiscite and prescribing other conditions. Further questions relating to the northern and southern boundaries of the two provinces as described in the treaty were decided by excluding the Peruvian province of Tarata on the north and maintaining the Peruvian provincial boundary between Arica and Tarapaca as they stood at the time of the treaty.

Peru's Objection.—Following the proclamation of the award, the Peruvian Defense Commission, representing Peru in the proceedings, entered, on April 2, representations with respect to the award on the ground that a substantial error had been committed by the arbitrator in mistranslating certain words of the treaty which, it was claimed, required that the plebiscite should have been taken promptly upon the expiration of the ten-year period. Moreover, certain specified guarantees were requested "as a condition for assuring the fairness of the voting." In reply, on April 9, the arbitrator justified the conclusion reached upon the basis of the phrase in question and observed that the determination of the conditions of the plebiscite constituted one of the questions submitted to the arbitrator.

Plebiscitary Commission.—General Pershing was appointed (March 23) chairman of the special Plebiscitary Commission which included two other members, Mr. Oscar H. Ordonez and Mr. Manuel de Freyre Santander, appointed by Chili and Peru respectively. At the same time a special Boundary Commission was appointed with Colonel J. J. Morrow as chairman, to carry out the second part of the award. Difficulties were experienced from the start owing to the charge by the Peruvian delegation that violence was being perpetrated by the Chilean authorities against Peruvian residents and even against the person of the Peruvian member of the Boundary Commission. Guarantees were requested by Peru and these were finally drawn up and accepted by the commission on Nov. 2, among them being the reduction of the military garrison at Tacna and Arica and the removal, at the request of the commission, of any of the civil authorities in the provinces.

Arrangements for Plebiscite.—The Plebiscitary Commission approved General Pershing's motion Dec. 9, 1925, naming Jan. 15, 1926, as the date for the presentation of the election law; Feb. 15 for the beginning of registration; March 15 for the ending of registration; three weeks more for all appeals, and the vote to be taken April 15. A motion by Chili to have the date of the plebiscite advanced was defeated. Thereupon Chili announced, Dec. 9, that an appeal would be taken to President Coolidge, the arbitrator. Such an appeal was provided for in the clauses of the award dealing with the Plebiscitary Commission. This placed General Pershing in a position of much difficulty. It was announced, late in December, that the state of his health was such as to make it desirable for him to return to the United States.

ORIENTAL RELATIONS OF THE UNITED STATES

By Harold Scott Quigley

Professor at University of Minnesota

Japanese Relations with China.—On January 21, 1925, Japan signed a general agreement with the Union of Soviet Socialist Republics, whereby Russia gained recognition from a second Far Eastern state, China having recognized her, May 31, 1924.

Among other things, Russia has granted to certain Japanese commercial interests a concession to exploit half the oil of northern Sakhalin. The Soviet government had previously granted concessions to the American Sinclair interests.

Return of Indemnity.—Of the $300,000 silver paid, February 21, 1925, by the Chinese government as indemnity for the occasion of the Lincheng bandit outrage of 1923, $144,000 went to Americans. President Coolidge, under date of July 16, 1925, authorized the Secretary of the Treasury to remit to the "Board of Trustees of the China Foundation for the Promotion of Education and Culture" all Boxer Indemnity payments still due the United States. The amount thus returned to China was $6,137,552.90, which, added to the amount returned in 1908 ($11,961,121.76), brought the total sum, returnable in installments, to $18,098,674.66, about three-fourths of the Boxer Indemnity to the United States.

Edgar A. Bancroft, Ambassador to Japan, who presented his credentials to the Prince Regent on November 19, 1924, died July 28, 1925, to the genuine sorrow of the Japanese nation. Charles MacVeagh of New York was appointed Ambassador to Japan and entered upon his office. Tsuneo Matsudaira succeeded Ambassador Hanihara at Washington. John Van Antwerp MacMurray entered upon his duties, in June, 1925, as Minister to China, in succession to Jacob Gould Schurman, transferred to Germany. With the appointment of M. L. M. Karakhan by the Union of Soviet Socialist Republics as its first ambassador to China, the Diplomatic Corps at Peking, on April 22, 1925, recognized his right to act as doyen. It was indicated that changed conditions had made the "Diplomatic Body," as a treaty-supporting agency, obsolete; and that henceforth matters of interest to a group of states would be taken up with the Chinese government by that group rather than by the diplomatic representatives as a whole.

Concessions to Americans.—No major issues entered into the relations between the United States and Japan during 1925. Discussions continued regarding the respective rights of American and Japanese companies, under concessions and under the Open Door understandings and agreements, respecting wireless development.

Fleet at Hawaii.—The manœuvers engaged in by the American fleet in Hawaiian waters during the summer aroused much bitter comment from a section of the Japanese public, and in July a number of organizations in Japan observed the first anniversary of the American immigration act of 1924 as "National Humiliation Day." In both countries the governments exerted themselves to prevent jingoistic propaganda.

Tariff Conference Proposed.—The policy of the United States is in brief to be the revision of treaties regarded by the Chinese as obsolete, and was applied during the year just past. It had been provided in the Customs Treaty of 1923 that a tariff conference should be convened within three months of the coming into force of the treaty for the purpose of levying additional tariffs of 2½ per cent. on ordinary goods and 5 per cent. on luxuries; and for the abolition of *likin*, the tax on inland transport. France refused to ratify the treaty until her dispute with China, the "Gold Franc Case," was settled. August 18, 1925, the Chinese Government invited the eight Powers, signatories, and the four adhering Powers, to send delegates to Peking for the conference, which met October 26, with members from each of the invited states, viz., Belgium, France, Great Britain, Italy, Japan, the Netherlands, Portugal, the United States, Denmark, Norway, Peru and Spain, in addition to the Chinese. The American delegates were Silas Strawn of Chicago and Minister MacMurray. C. T. Wang was China's chief delegate and Shen Jiu-lin, the Chinese Foreign Minister, presided over the Conference.

Outbreak in Shanghai.—Conditions in China when this Conference convened were disturbing. The nationalist sentiment, the growth of which has been marked since the Great War, and which has been stimulated by the Soviet Ambassador, flamed out in May, 1925, at Shanghai, when foreign police in the International Settlement fired upon and killed students demonstrating against the shooting by the International Police of Chinese strikers in Japanese cotton mills. Boycotts against British and Japanese trade were declared by the merchants of Shanghai, Canton and other cities, and general strikes of laborers tied up city and household services and paralyzed river and ocean transportation. American interests suffered somewhat, but recovered the losses at the expense of Japanese and British competitors against whom the boycotts and strikes primarily were directed. An investigation by the Diplomatic Corps found that the Settlement police acted hastily. Subsequently a judicial inquiry was instituted by Great Britain, the United States and Japan; Chinese sentiment, official and private, regarded this inquiry as unnecessary and Chinese cooperation was withheld.

The report of the judicial commission was published as three separate statements of the disagreeing commissioners. The reports of the British and Japanese commissioners held that the Shanghai police officials had acted properly; that of the American, Judge E. Finley Johnson, took the position that the officials had failed to appreciate the gravity of the situation and to take proper measures to meet it. The two principal officials concerned resigned.

Civil War.—The Anfu clique, in control at Peking since the fall of 1924, was not well-seated and a struggle for its overthrow broke out on the eve of the Conference. The principals in the new military scene were

Chang Tso-lin, supertuchun of Manchuria, Feng Yu-hsiang, the "Christian General," controlling northwest China, and Wu Pei-fu, military genius of the Chihli clique, influential in central China, with various other military governors.

Tariff Conference in Session.—In spite of the mixed atmosphere of nationalism and civil war, the Tariff Conference was able to take up and proceed with the agenda suggested by the Chinese Government. The agenda included the following items:

A. Tariff Autonomy.

1. Adoption by the Chinese Government of the Chinese general customs tariff. (For practical convenience a period is to be agreed upon within which to make preparations for the coming into force of tariff autonomy and the application of the Chinese general customs tariff.)
2. Abolition of likin.

B. Provisional Interim Measures.

1. Levy of an interim surtax period.
2. Levy of a surtax on articles of luxury.
3. Arrangements to unify the rates of customs duties at the land and maritime frontiers.
4. Valuation of commodities.

C. Related Matters.

1. Arrangements to ascertain the country of origin of imported goods or products.
2. The depositing of customs revenues.

Plans of Adjustment.—Three plans were laid before the Conference: (1) The Chinese plan called for the recognition of customs autonomy for China, effective January 1, 1929. For the interim period China suggested that surtaxes of 5 per cent. should be authorized upon ordinary goods and of 30 per cent. and 20 per cent. on A and B grade luxuries respectively. She, on her part, expressed the intention of abolishing likin prior to the date set for the effectuation of customs autonomy. Every item in this plan except the last went considerably beyond the revision specifically contemplated in the Customs Treaty of 1922. Nevertheless, both the Americans and Japanese accepted the first and most important feature—customs autonomy, but set up as a condition precedent to autonomy the abolition of likin. The American plan prescribed the continuance of the existing system of customs administration and provided for the allocation of the anticipated additional revenues to three purposes: (1) compensation of the provinces for the abolition of likin; (2) the refunding of unsecured debts; (3) the payment of administrative expenses of the central government.

Tariff and Likin.—The Chinese government was opposed to the condition of likin abolition; consequently the other Conference delegations agreed unanimously to the unconditional acceptance of China's autonomy proposal. Concurrently the Chinese delegation stated the intention of its government to abolish likin prior to the effectuation of autonomy. The two decisions were embodied in the following resolution:

> The delegates of the Powers assembled at this Conference resolve to adopt the following proposed article relating to tariff autonomy with a view to incorporating it, together with other matters, to be hereafter agreed upon, in a treaty which is to be signed at this Conference:
>
> The Contracting Powers other than China hereby recognize China's right to enjoy tariff autonomy; agree to remove the tariff restrictions which are contained in existing treaties between themselves respectively and China; and consent to the going into effect of the Chinese National Tariff Law on January 1, 1929.
>
> The Government of the Republic of China declares that *likin* shall be abolished simultaneously with the enforcement of the Chinese National Tariff Law; and further declares that the abolition of *likin* shall be effectively carried out by the First Day of the First Month of the Eighteenth Year of the Republic of China (January 1, 1929).

Extra-territoriality.—Pursuant to Resolution V of the Washington Conference, which provided for investigation "into the present status of extraterritorial jurisdiction in China" and "into the laws and the judicial system and the methods of judicial administration of China" with a view to making recommendations as to the reforms which might be made in order to justify the relinquishment of extraterritorial rights, the Secretary of State in identical notes to the twelve states which, with the United States, had signed or adhered to the Resolution, stated that the United States had appointed Mr. Silas Strawn as its commissioner and suggested that the commission convene in Peking on December 18, 1925. Prior action to that end had been withheld in 1922 at the request of the Chinese Government, which considered that conditions were not propitious for a satisfactory conclusion of the investigation, and in 1923 and 1924, when the Chinese Government informed the powers of its desire to have the commission begin its work, because of failure to secure unanimous consent from all the states concerned. On the date set for the commission to meet dispatches from Peking announced that the opening session of the commission had been postponed on account of the inability of some of the delegates to reach Peking due to the interference with railway traffic resulting from the civil warfare. In an address of the same date Secretary Kellogg expressed the hope that the commission would be able to assist China to regain jurisdiction over foreigners within her territory.

CHINESE CUSTOMS CONFERENCE

Peking Meeting.—Representatives of twelve nations came together at Peking, October 26—namely, the United States, Great Britain, France, Italy, Japan, Spain, the Netherlands, Belgium, Portugal, Denmark, Norway and Peru, met at Peking at the invitation of the Chinese government to carry out the revision of the Chinese customs tariff in accordance with the Treaty of Washington (Arts. I-IV), February 6, 1922. From the start it was clear that, as had been intimated in the invitations, the proposals of China would go far beyond the limited "revision" contemplated in the Washington Treaty. Dr. Wang, the head of the Chinese delegation, proposed at the first meeting that on their part the foreign powers should recognize China's autonomy in respect to the tariff; while China on her part was ready to abolish the internal tax known as likin.

American Plan.—Tariff autonomy for China being approved in principle by the delegates of the states represented, subject to the condition stipulated by China, the American minister, Mr. MacMurray, thereupon presented a definite plan, to be embodied in the text of a treaty, by which the principle of tariff autonomy, thus recognized, might by successive stages become an accomplished fact. Chinese customs rates were to be forthwith raised to 7½ per cent. on all goods, being the 2½ per cent. surtax contemplated in Art. III of the Washington treaty, and to 12½ on certain luxuries. Likin and related internal taxes were to be abolished; and, subject to the fulfillment by China of the conditions imposed, the treaty restrictions upon China's tariff should terminate and the Chinese national tariff should come into force on Jan. 1, 1929.

Conditions.—Among these proposed conditions imposed were: the increased revenues resulting from tariff autonomy should be used for: (1) a compensation to the provinces for the abolition of likin; (2) payment of rebate charges; (3) refunding of unsecured debts; (4) administrative expenses of the Central Government. November 19, a resolution was adopted by the Powers that the Chinese National Tariff law was to go into effect Jan. 1, 1929, while China pledged herself that likin should be simultaneously abolished.

INFLUENCE OF THE UNITED STATES IN WORLD AFFAIRS

By Denys P. Myers
World Peace Foundation

BASIS

The influence of any state upon general world affairs is difficult to estimate by objective standards. Estimation of American influence is still further complicated by special theses which the United States applies politically and by special postures which affect its action in some parts of the world.

The influence of the United States in world affairs will be better appreciated if the legal position of such a state internationally is recalled. States are "equal" as to legal competence, but not as to physical status, possession of interests, influence or activity in the world. The formula now employed is to base representation upon the extent to which states possess "general interests" or "special interests" in the business at hand. The principle that states "attend sessions at which questions interesting them will be discussed is practiced internationally by 55 states in the Assembly and Council of the League of Nations.

This formula is recognized continuously in the popular distinction between the "great powers" and the "small powers," terms which perhaps connote too specifically the single element of military ability. However, they may be employed for the sake of convenience. "Great powers" may vary in weight and influence among themselves, as was determined in the ratios of the Washington treaty on limitation of naval armament. "Small powers" may on occasion exercise the weight or influence of a "great power," chiefly by reason of the excellence of ideas, mediatory reasonableness and the quality of persons representing them.

ANOMALIES

The position of the United States is anomalous. It is a "great power" and is insistent upon that position, although the status is not questioned. But it acts on a policy of limited interests, as circumstances constrain a "small power" to do. Both as a great and as a small power it acts positively and negatively, both to do and to prevent doing. But whether positive or negative, its influence is that of a great power by reason of its sheer weight in the world of states.

American policy is not consistent throughout the world. Canadian relations being exceptional, the United States in the Western Hemisphere acts in accordance with the patent fact of its being the sole "great power" in the region; its influence is both welcomed and resented, though not denied, while its self-restraint is not always appreciated or rightly interpreted. Its influence in Latin America decreases as those states participate more fully in international affairs. In Asia it acts the "great power" pursuing its own interests, but without the territorial and raw-material objectives of less crowded and less endowed states. Toward Russia, American policy was uniformly friendly during the imperial régime, but its opposition to the advertised purposes of the Soviet régime has been officially unaffected by developing economic relations, which have modified the attitude of other states. The United States always insists on its conviction that it is different from Europe, especially in the two respects of governmental form and method of conducting its foreign relations. The sweep of democracy over Europe since the war has fundamentally altered the premise on which the first conviction was based.

RESPONSIBILITIES

As to the conduct of foreign relations, the ability of governments to make purely executive treaties without reference to parliaments or to keep them secret has disappeared in practice. It may be doubted whether any state not temporarily ruled by a dictator is now more capable of making "secret treaties" than the United States. A real differentiation exists with regard to another phase of foreign relations. Europe has always been a territory of closely intertwined relations; American foreign affairs have been simple. The European conviction that the problems of reparation and interallied debt payments are related and the American assertion that they are not to be related are both typical. For the distinctive attitude of American diplomacy has always been the separation of problems. If the doctrine of American isolation has been true, it has consisted more in isolating the issues of foreign affairs than in isolating the country.

Senate.—The Senate acts as a resistance coil to the Executive's conduct of foreign relations, rather than as a transformer of the public opinion it assumes to represent. It is neither more responsive nor more responsible to the public than the Executive; it makes negative use of its constitutional right to defeat policy by its one-third veto of treaties; coöperation with the Executive is laboriously and tardily effected and frequently conditioned upon legislative rather than national interests. The bringing of the Permanent Court of International Justice to a vote, the delay on the Isle of Pines treaty, the reservations on the German commercial treaty illustrate these characteristics of Senatorial coöperation.

Initiative.—Still another factor in any attempt to estimate the influence of the United States in world affairs is the almost free initiative of its citizens. American nationals do not depend on government permission to engage in enterprises abroad, nor can they count on it to make their case its own in any such degree as is common elsewhere. The influence of their activities on world affairs may be as important, though not as final, as that of their Government. By reason of the interests of its citizens, the United States has as many contacts with world affairs as any other state whatsoever.

One characteristic of the American mind, its practicality, accounts for a large part of its influence, whether exerted officially or unofficially.

The foregoing considerations militate against the influence of the United States being exerted to its full potential scope. American influence in current international affairs depends, first, upon whether the President finds it possible to participate in a given negotiation by demonstrating a special interest therein; secondly, upon whether the matter can be left to private initiative; thirdly, upon the part of the world concerned or even the locus of the negotiation.

SHARE IN REHABILITATION

The Washington Government was a full party to the Paris Peace Conference, in which it acted as a power of general interests. It did not ratify the treaty of Versailles or the other peace treaties. Instead, it negotiated "treaties restoring friendly relations" with its ex-enemies, treaties which were schedules to the Paris treaties. In this step, was a sharp reversion to a policy pursuing special interests, limited and definite. This was a very effective posture. During 1925, it approached futility and increasingly free participation occurred.

The American citizen who is abroad because of special qualifications for a specific task has added greatly to national prestige. Jeremiah Smith, Jr., in Hungary, Charles P. Howland in the Greek Refugee Settlement Commission, Arthur C. Millspaugh in Persia, S. Parker Gilbert and Joseph E. Sterrett at Berlin, Walter P. Cook at Paris, E. W. Kemmerer at Santiago de Chile have done or are doing notable work, all in the financial field. Their weight in affairs is not duplicated in any other field and in most instances their value to the reputation of the United States is not due to any attitude of their own Government. "The delegation of the citizen-of-the-United-States member of the Reparation Commission by virtue of the inter-allied agreement of August 30, 1924," plays an appreciated part; the "unofficial observer" of the Department of State on the Reparation Commission is tolerated.

COMMERCE

In the field of commerce the Government is more aggressive than its citizens. The urge to enter the foreign market is to a considerable degree inspired from Washington. On the other hand, initiative is entirely left to the trader. Nor does trade necessarily follow governmental policy. American trade with Soviet Russia in 1925 increased relatively more rapidly than that of other countries. Trade, however, does not particularly increase the prestige of the United States. The immense internal market makes American external trade very small proportionately, while both the tariff and the high dollar cause the foreigner to limit it to essential raw materials and exclusive manufactures. American foreign commerce, more than any other, is based on the necessities of the buyer rather than the common element of mutual advantage. As a consequence, American foreign trade policy is less sensitive and less elastic than that of most countries. This circumstance during 1925, a year in which the world made notable strides toward "normalcy," resulted in clear indications that other countries, especially in Europe, foresee the possibility of developing their mutual trade independently of American offerings. Only in the Far East do they prefer to trade with Americans rather than others.

LEAGUE OF NATIONS

During 1925 the United States Government has maintained a less negative attitude toward the League of Nations than in the past. On the other hand, the negative attitude had ceased to be effective. Technically speaking, the United States is not represented on any League commission; but government officials are members of several, some of whom are active Foreign Service officers. However, in almost every activity at Geneva are American citizens, contributing to action which states other than their own deem worth while. The largest contributions of private funds to specific League activities have come from America.

The negative influence which the United States exercised for several years over the plans of the Assembly and Council of the League of Nations has ceased. They did not act in the hope that the United States might itself act, they postponed decisions in expectation that the United States would consent to participate. In 1925 the League states made a practice of taking decisions regardless of whether the United States had or had not expressed its opinion or decided the question of its participation. Repeated suggestions that the United States might call an armament conference have not halted the continuous Geneva program for attaining agreement on that problem.

CONFERENCES

The United States delegation withdrew from the Second Opium Conference on the ground that its decisions were not sufficiently fundamental. Undoubtedly the American attitude resulted in more being agreed to than otherwise would have. The American argument was that the international agreement was not worthy of signing because it did not go beyond its existing national legislation. The foreign attitude is that the United States jeopardized the success of reforms representing a considerable advance in international practice and refused to accept this improvement because its full program was not adopted.

In the Conference on International Trade in Arms, Munitions and Implements of War, the American delegation took a normal part. Foreign doubts exist, however, whether the Government will be able to ratify the convention. In any case, they regard the United States as largely responsible for the lack of control over this trade since the war.

In the Conference on the Chinese Customs Tariff, the United States proposal was the basis of discussion, the actual decisions reached up to December 1, however, being on points common to all the proposals.

INDIRECT INFLUENCES

Influence of the United States in Europe has been carefully circumscribed and exerted passively rather than actively. In December, 1922, Chancellor Cuno of Germany made to France, through the Department of State of the United States, a peace proposal which was the forerunner of the "security" project of February 9, 1925. In 1922 the idea was that the United States act as a sort of stakeholder of the agreement to be reached. The Secretary of State declined to transmit the proposal to the Poincaré Government of France. The original 1925 suggestion contained a clause contemplating the United States as guaranteeing trustee. The suggestion was not formally communicated and the United States itself took no step to have any relation to Locarno. The American policy of limited interests thus left that conference entirely uninfluenced by Washington.

FINANCIAL POLICY

Economic consequences of the war have made the United States the principal reservoir of capital and the excessive gold supply here has rendered desirable the establishment of credits against it. The relation or the Government to the investment of capital abroad is a limited one; it is assumed to have a bearing upon foreign relations. The Department of State, the Treasury and the Department of Commerce have no legal supervision over the flotation of foreign loans on the American market, either for public or private purposes. But the Government does not let the financiers alone in their field. The Department of State regards flotations as a matter of public concern, "in view of the possible national interests involved." It expects to be afforded an opportunity to indicate whether it desires to raise objections to particular transactions, but it "will not pass upon the merits of foreign loans as business propositions, nor assume any responsibility whatever in connection with loan transactions." *

This policy is not only a very delicate one to pursue but it invites rather than allays a disposition to misunderstanding or misinterpretation. Such statements of action under it as have been made indicate that the United States Government has considered the political and economic effect of loans upon mutual relations; has discouraged loans for armament purposes; has objected to public loans "for unproductive purposes" to governments whose debts to the United States Government have been unfunded; has discouraged the development of "economic exploitation," and has objected to the monopolization of products consumed by the United States. The policy has been the subject of much narrow criticism and defenses of it have too often assumed it represented virtues not involved. But, taking it all in all, it has beneficially increased the influence of American finance abroad. Without exception, borrowers and lenders have been better friends after than before the loans were made. Justice lies in a balance of interests, and true progress in keeping the channels of friendship open for development.

During 1925 the United States Treasury has made debt funding agreements with the Governments of Belgium, Czechoslovakia, Esthonia, Italy, Latvia and Rumania. If the Congress accepts the relaxations from the British terms included in some of them, the United States will, in the judgment of many capable Americans, have confirmed a wise step. The debt policy has created an impression abroad which is not defined there as "helpfulness."

LATIN AMERICA

The position of the United States in Latin America has on the whole improved. The old Tacna-Arica dispute was arbitrated by the President, who appointed the head of the plebiscitary commission. Peru twice protested the terms of the award, and Chile by no means made the work of the commission easier. However, those moves were in the nature of things and have not permanently affected relations with the United States. The withdrawal of marines in August from Managua, Nicaragua, on six-months' notice was prefaced by a refusal to continue them longer in a place where they had already remained 13 years. Secretary of States Kellogg in a public statement in June made a sharp attack on the Mexican Government, which retorted in like terms. Apparently, opinion in the United States did not ratify the judgment of the Secretary of State in originating the passage at arms. The incident, interpreted in Spanish speaking America in its worst light, contributed to a feeling of distrust against the United States outside of Latin American governmental circles.

---

* "Flotation of Foreign Loans," State Department communiqué, March 3, 1922; "The Department of State and Foreign Loans," address of Arthur N. Young at Williamstown, August 26, 1925.

The year may be said to have left the position of the United States about what it was in Latin America, which remains suspicious of American Caribbean policy and action, and does not appreciate having the Monroe doctrine interpreted solely by the Washington Government.

FAR EAST

In the Far East the influence of the United States was at its highest. The Japanese Government has not forgotten that the President and the Secretary of State were unfavorable to the passage of the immigration exclusion law, and has gone out of its way to avoid treading on American susceptibilities; for instance, the extraordinary homage paid to the memory of Ambassador Bancroft. Official relations with Japan are on a much better basis than popular relations, which are controlled by Tokyo and uncontrolled by Washington.

The position of the United States in China remains curious. Though the Washington Government benefits from every foreign advantage secured from the Peking Government, except territorial enclaves, both countries have always assumed that they were close friends. The Chinese authorities maintain most grateful relations with the American. The national of the United States is not, however, as popular among the Chinese people as he has been, but that is doubtless temporary and due to division of opinion respecting Chinese aspirations, which will disappear when tariff autonomy, etc., are settled.

ECONOMIC POLICY

The real influence of the United States in 1925 has been economical and financial. It has been most effective in Germany, which has steadily replenished its capital from United States supplies. The economic field is the only one in which the United States has participated freely in world affairs. In view of the impoverished condition resulting from the World War, the emphasis has undoubtedly been correct. Active co-operation in other fields has been casual. The President in his annual message of December 7, said: "The example of this attitude has not been without its influence upon other countries." The attitude referred to is the seeking of "better understandings through conference and exchange of views" and the "gradual elimination of disputes." In those matters few other countries would admit that their inspiration came from America.

THE INSTITUTE OF POLITICS

By William M. Schuyler

Editor, Institute Bureau of Records, 1925

Objects.—The fifth annual session of the Institute of Politics was held at Williams College in Williamstown, Mass., July 23 to August 22. To avoid misconception Dr. Harry A. Garfield, President of Williams College and Chairman of the Institute of Politics, deemed it desirable that the purposes of the Institute should be restated. In the opening address at the inauguration ceremony in Chapin Hall on July 24 President Garfield, among other things, said:

"The object of the Institute of Politics is enlightenment. . . . In the midst of the chaos of things, of the triumphant overwhelming burden of success, western civilization needs enlightenment. It needs a new revolution of those impelling forces which drove God's creatures up out of the sea upon the land, out of the trees into the fields, out of mere brute strength into intellectual power. We of the western world have separated ourselves too far from those of the East. Neither East nor West can stand alone. Together they may save the world, utilizing western strength and eastern vision.

"But these things cannot be realized unless first we understand one another. Understanding is a condition precedent to enlightenment. Therefore, the Institute of Politics seeks to bring together in this place those who, believing in the vision, seek to understand one another, and if possible to trace to their beginnings those experiences and influences that have created present conditions. We are not seeking to inform members for their own sakes but in the interest of the common welfare. For this reason the Institute offers no certificate of graduation though the members get much by attendance; they are invited to attend not that they may get, but that they may give—give freely of their store of knowledge and experience to the end that public opinion may be informed and enlightened. The object of the Institute is humanistic. We are more interested in promoting the welfare of mankind than in conserving its possessions; yet we recognize that the things men possess are useful and necessary to their well being—even to their spiritual progress.

"During the first session of the Institute (1921) there were many who failed to understand why our conferences stopped short of action. What is the use of discussing ideas, of exchanging information if we are to do nothing? Why not at least adopt a resolution, declare a purpose? . . . We are seeking primarily to inform ourselves, not to convince others; to see each with his own eye below the restless surface of human desires into the depths of human needs. . . .

"Conferences like this and the many others that are now held in this country and throughout the world for the purpose of enlightening public opinion are assemblies precedent to the official parliaments of nations and because they are unofficial, because they do not attempt to frame programs or adopt resolutions, because in short they are places of confidence and good will, there come to them without fear of embarrassment officials from foreign countries and from the departments of our own government, officials who, speaking in their private capacities, contribute in most important ways to the understanding of the members of the Institute, to the enlightenment of the citizenship of our country."

Attendance.—The registration at this year's session of the Institute was substantially heavier than that of any previous year. The total number of persons engaged in the work of the Institute, whether as fully qualified members or as assistants in the various round tables and conferences and in the Bureau of Records, was 317 of whom 181 were active members and 51 were associate members. This distinction in membership was made to solve the difficulties of those who wished to reside at Williamstown during the session of the Institute in order that they might enjoy the privilege of attending the evening lectures and general conferences without obligating themselves to participate in the actual discussions. This distinction also relieved the Institute authorities of the obligation of providing quarters for the less active members of the Institute.

Lectures.—The program called for lectures in Chapin Hall practically every week-day evening. The lecturers resident in Williamstown throughout the session were Count Antonio Cippico, Italian Senator and staunch supporter of Mussolini, whose topic was the Mediterranean Area and Italy; M. Robert Masson of France, a Director and practically the manager of the Crédit Lyonnais, who spoke on the Peace Problems of France; and Dr. William E. Rappard of Switzerland, a member of the Permanent Mandates Commission of the League of Nations, who chose as the subject of his series of lectures "International Relations as Viewed from Geneva." In addition to these three lecturers, each of whom spoke two or three times each week, there was Count Skrzynski, the foreign Minister of Poland, who arrived in this country on July 14, and after conferring with President Coolidge at Swampscot and subsequently visiting New York and Washington, went to Williamstown, where he delivered a lecture before the Institute on the evening of July 30. Count Skrzynski's address was on the subject of America and Polish Democracy, in which he reviewed some of the critical postwar problems of Poland. M. Felix Valyi, a native of Hungary now residing in Paris, formerly editor of the *Revue Internationale Politique*, gave a lecture on the evening of August 10 on the subject of "The Spirit of Asia and Asiatic History."

Round Tables.—The closed Round Table conferences comprised the following general topics: Agriculture and Population Increase, conducted by Professor Edward M. East of the Chair of Plant Morphology at Harvard University; the Economic Recovery of Europe, by Professor Edwin F. Gay of Harvard University; Mineral Resources as a New Environmental Factor in World Affairs, by Professor Charles K. Leith of the University of Wisconsin; Limitation of Armaments, by Major General Sir Frederick Maurice, who was the Chief of Operations on the British General Staff during the War and known in intellectual circles on this side of the Atlantic as the author of the *Life of General Robert E. Lee;* International Justice, by Professor Jesse S. Reeves of the University of Michigan; Outstanding Problems in Inter-American Relations, by Dr. Leo S. Rowe, Director-General of the Pan-American Union; Some Political Problems in Contemporary Europe, by Professor Bernadotte E. Schmitt of the University of Chicago, and The Mediterranean Area (with special reference to the relations between the European powers and the Arabic speaking peoples), by Professor Arnold J. Toynbee of London (Eng.) University. In addition to the Round Table conferences two general conferences were arranged for, the first dealing with the subject of the Recent Foreign Policy of the United States, conducted by Professor George H. Blakeslee of Clark University, and the second, The British Commonwealth, conducted by Lionel Curtis of Great Britain, who is regarded as the spokesman for English thought in the movement for a Commonwealth of Nations. Mr. Curtis, who is a Fellow of All-Souls College, Oxford, and Editor of the *Round Table Magazine*, was one of the founders and now serves in the capacity of honorary secretary of the British Institute of International Affairs, an organization which in some respects is similar to the Institute of Politics.

Open Conferences. — There were also several informal or specially arranged open conferences at which many of the controversial questions of the day were presented for free discussion. In the first week of the Institute's session William R. Castle, Jr., Chief of the Division of Western European Affairs, Department of State, summarized the policy of the Administration of President Coolidge towards Europe. He stated that this Government would insist upon the funding of all war debts, but that under no circumstances would it play the rôle of "Shylock." Mr. Castle expressed the aim of American policy toward Europe as "helpfulness without impertinent interference, coöperation without entanglement, avoidance of policies which cannot be fulfilled and scrupulous fulfillment of engagements." Prefacing his remark by stating that he was ready to applaud any good thing which comes out of the League of Nations, Mr. Castle said of the World Court that "it approaches the ideal toward which the policy of this country has always worked."

Japan.—Addressing his Round Table on Mineral Resources in World Affairs, Professor Leith took occasion to dispel some of the illusions concerning Japan as a formidable world power. "Japan," he said, "is woefully weak in the main sinew of war —steel—and knows it." He pointed out that it would be scarcely possible for Japan, even if she could get a supply of steel in the Philippines or in China or elsewhere, to maintain a huge steel plant merely for war purposes. He emphasized the fact that the consuming capacity of Japan for steel products is so small that she could not support a large industry in time of peace.

Limitation of Armaments.—Considerable controversy arose in the Round Table of General Maurice, which dealt with the Limitation of Armaments. General Maurice insisted that Europe as a whole was just as much of an armed camp now as it was before the war. He attributed this fact to the fear which nations in Europe entertain for each other. That this was not to be interpreted as a likely cause for war in the near future General Maurice indicated when he said that it was "extremely improbable that there would be a general European war within the next twenty years." The only barrier to such a conflict which he was prepared to cite was the general desire in Europe to avoid another war, a desire which possibly may be said to have become vocalized in the more recent Locarno Pact. Admiral Huse of the United States Navy declared that there was no point in discussing limitation of armaments so long as there were many economic causes for conflict. The subject of General Maurice's Round Table proved in fact to be one of the most controversial topics discussed at Williamstown, but it served to emphasize the principle note sounded at the Institute, which was the desire of all peoples and all nations to maintain peace or at any rate to seek the means for maintaining peace.

Population and Immigration.—The population and immigration question engaged much of the interest of the members and the leaders of the Institute. An episode arising out of this interest was the spirited issue which arose between Count Cippico and Professor East concerning the solution of Italy's excess population problem. Count Cippico drew the fire of Professor East's criticism by stating that one of two things must be done to help Italy provide for her excess population: that colonial territories should be given to Italy where her people can settle under the Italian flag, or that in foreign and thinly populated countries Italian emigrants must be grouped together and remain Italian citizens. Professor East in effect held that the world was under no such obligation to Italy, contending that the solution lay in the exercise of birth control. Professor East used such vigorous language in driving home his point that Count Cippico was offended and declined to discuss the matter with him. Dr. Garfield also took cognizance of the incident to the extent of defending the Italian immigrant in this country, his usefulness, etc., as a laborer and a farmer. In some quarters Dr. Garfield's observations were interpreted as a rebuke to Professor East.

Endowment.—Taken as a whole the fifth annual session of the Institute was marked by the utmost harmony and a most fruitful interchange of views between a widely diverse group of spokesmen. The usefulness of the Institute in fact was so clearly demonstrated that immediately following its close preparations were begun to raise $1,000,000, to be used as a permanent endowment for the Institute. Heretofore the Institute has been supported from year to year mainly by individual support. This year that support was derived from Bernard M. Baruch, the Carnegie Foundation and the General Educational Board. Plans were still in the making for this undertaking when the year closed. The Institute had already been provided for financially for another two years. It is expected that the endowment enterprise will be well developed before the next session of the Institute.

PART TWO
AMERICAN GOVERNMENT

DIVISION III
CITIZENSHIP AND PERSONAL RIGHTS

CITIZENSHIP AND NATURALIZATION LAWS

By Richard M. Flournoy, Jr.
U. S. Department of State

In this article the words "citizen" and "national" and the words "citizenship" and "nationality," referring to the relationship of the individual to the state, will be used interchangeably as being synonymous.

Citizenship Problem.—During the past two decades, because of the vast influx of aliens into the United States, the nationality problem, including questions relating to immigration, naturalization and expatriation, has been more and more engaging the attention of thoughtful men and women, in and out of the Government, who are solicitous of the future character and welfare of this country. It has come to be realized that the material of which the citizenship of the country is made is a matter of far greater importance than certain economic problems which have so largely occupied public attention in past years. Tariffs and railroad rates may be changed over night, but this is not true of the citizenship of the country. The effects of the very liberal immigration laws of past years will be felt through untold generations. It may be said without exaggeration that the citizenship problem is the chief political problem before this country at the present day. It is coming to be realized that the immigration problem should be considered more and more with regard to the ultimate political and social good of the country, rather than with regard to immediate economic demands. The general interest in the subject is indicated, not only by discussion in newspapers and magazines, but also by Acts of Congress and decisions of courts.

CHANGES IN THE NATURALIZATION LAWS

Acts of 1906 and 1907.—In the years 1906 and 1907 questions concerning naturalization and expatriation and the citizenship of married women and children born abroad of American citizens engaged the attention of Congress, with the result that two very useful statutes were passed, namely, the Naturalization Act of June 29, 1906 (34 Stat. Pt. I, 596), and the Citizenship Act of March 2, 1907 (34 Stat. Pt. I, 1228).

The principal objects of the Naturalization Act were to bring about more uniformity and greater strictness in the naturalization process and to enable the executive branch of the Government to supervise naturalization to some extent through a new agency, the Bureau of Naturalization, in which complete records of naturalization are kept. Naturalization continued to be a judicial process, however, although agents of the Bureau of Naturalization known as Naturalization Examiners can appear before the courts and oppose the admission to citizenship of individuals who appear to be inadmissible under the law.

Proposed Administrative Process.—The Naturalization Act of 1906 has been very beneficial, not only by preventing the admission to citizenship, through fraud, on the part of the aliens or carelessness on the part of the courts, of persons not entitled thereto, but also by furnishing the executive branch of the Government with data concerning naturalization which will be of great value in shaping future legislation. However, the law is not perfect.

Suggested Amendment.—The Commissioner of Naturalization, Mr. Raymond F. Crist, in his annual report to the Secretary of Labor for the fiscal year ended June 30, 1925 (Government Printing Office, Washington, D. C., 10 cents per copy), recommends various amendments, one of which is of a radical character. On page 27 of the report he says:

> It is recommended that naturalization be made an administrative function instead of a judicial one, with the right of appeal to the appropriate United States court after an administrative review of an adverse decision in the Bureau of Naturalization.

With regard to this same matter the Commissioner, on page 23 of the report, makes the following observations:

> The recommendation for administrative courts has been urged for years by both Federal and State judges who have conferred the largest number of naturalizations, and who feel that the present system does not afford the dignity that should be given this most important of subjects.
>
> With proper compensation there is no doubt that as highly patriotic and capable citizens could be found to sit as naturalization judges in administrative courts as now occupy other positions of equal trust and responsibility. As specialists in the naturalization law, the conclusion that they would render better service is in no sense a reflection upon the judiciary.

Naturalization Through Courts.—Since the passage of the first naturalization law (Act of March 26, 1790, I Stat. at L. 103), naturalization has been conferred by the courts. Probably this function was placed upon the courts not because it was believed that the act of conferring citizenship upon an alien is in its nature a judicial act, but for the simple reason that there were no executive agencies scattered throughout the country which were fitted for this important task and the creation of special naturalization offices was considered too expensive. The courts have held that decrees of naturalization are "judgments" of the courts. (Spratt v. Spratt, 4 Peters 393; Van Dyne on Naturalization, p. 10, and cases cited).

Administrative Character. — However, although naturalization may be in form a judicial function, it is essentially an administrative act. The court does not decide that the petitioner, by doing certain things, has become a citizen of the United States; it confers citizenship upon him, after being satisfied that he has met the legal requirements. This question was considered by the District Court of the United States for the Eastern District of Michigan in a recent case relating to the right under the law to cancel the certificate of naturalization of one John Mohammed Ali, a native of India who alleged that he was of Arabian ancestry, upon the ground that he was not a "white person," within the meaning of the naturalization law (Section 2169, Revised Statutes of the United States). Judge Tuttle, in rendering the opinion holding that the certificate of naturalization should be canceled, made the following observations:

> It is urged on behalf of the defendant that the question whether he is entitled to citizenship was conclusively decided in his favor by the action of this court in granting him his certificate of citizenship in the naturalization proceedings already referred to, and that such question is therefore res judicata, and cannot be raised by the government in the present proceeding. This contention cannot be sustained. It is now settled law that the statutory naturalization proceeding by which an alien seeks the privilege of citizenship is not a judicial adversary proceeding in any true legal sense, and that an order directing the issuance of a certificate of citizenship in such naturalization proceeding is, in essence, not a judgment rendered by a court in a pending suit between adverse parties, and as such final and binding upon said parties as to all matters involved in the suit and decided by the judgment, but is merely a grant, in special proceedings authorized by Congress, of a political privilege conferred by the government upon the petitioning alien purely as a gratuity, and subject to whatever terms and conditions Congress may impose therein, including the right of the government to insist upon a cancella-

tion of such certificate. if found to have been illegally procured. Johannessen v. United States, 225 U. S. 227, 32 S. Ct. 613, 56 L. Ed. 1066; United States v. Ness, 245 U. S. 319, 38 S. Ct. 118, 62 L. Ed. 321. (United States v. Ali, 7 Fed. (2nd) 728, 730.)

In New York, Boston, Chicago, Philadelphia and other centers of alien population the judges of the courts which are now burdened with the task of naturalization of aliens would, no doubt, be greatly pleased if Congress should relieve them of this burden, so remotely related to their normal functions, and place it upon officers specially created and fitted for the work. Whether such offices should in form be "administrative courts" or executive bureaus is, perhaps, not of great importance. The fact that some of the courts sometimes grant naturalization to hundreds of aliens in a single day seems to show that the proposed change is urgently needed.

Naturalization Examiners.—It appears from the Commissioner's report that the Naturalization Examiners are already doing a large part of the work relating to naturalization, including the preparation of the papers and examination of the petitioners and that many of the courts rely upon their recommendations to a very great extent in deciding whether to grant or whether to withhold naturalization. (See pages 17-18 of the Report.)

Qualification in English.—Another interesting recommendation of the Commissioner is that every alien applying for naturalization should be required not only to speak and write in the English language, as at present, but also "to read and discuss in the English language any suitable article from a newspaper and to evidence a knowledge of the institutions of the Government to the satisfaction of the naturalization examiner prior to petitioning." (Report, p. 26.)

DUAL NATIONALITY

By Richard M. Flournoy, Jr.
U. S. Department of State

STATUS

Dual nationality or double citizenship, may exist in the case of a person born in one country of parents who are nationals of another country. Under the *jus soli* he may be claimed as a national of the country of his birth, but under the *jus sanguinus* he may likewise be claimed as a national of the country of his parents' nationality. It has frequently been said that a person born with dual nationality, should upon attaining his majority or shortly thereafter, make an election of the nationality which he wishes to retain.

RECENT DECISIONS

Mackenzie Case.—October 30, 1925, Judge Parker, Umpire of the German-American Claims Commission rendered a decision on dual status (William Mackenzie, individually and as Administrator of the Estate of Mary A. Mackenzie, deceased, and others v. Germany). It was held that the law of the United States does not recognize loss of American nationality through "election" of a foreign nationality. This case related to the status of the widow of one Robert A. G. Mackenzie, who was born in the United States of British parents on June 4, 1858, was taken as a child by his parents to England, was married in England in 1879, thereafter resided for some years in Canada, and in 1894 returned to the United States, where he died in 1901. It seems that the German Agent had challenged the right of the administrator of his widow to present a claim to the Commission upon the ground that, by his long residence in British territory after attaining his majority, he had elected British nationality and had lost his American nationality. In the course of his opinion Judge Parker said:

> Citizenship is determined by rules prescribed by municipal law. The issue here presented must be determined by the law obtaining and enforced within the jurisdic-

tion of the United States. Under that law Robert A. G. Mackenzie, who was born in the United States of British parents, was by birth an American national, notwithstanding the Fourteenth Amendment to the Constitution had not then been adopted and the statutes in pursuance thereof had not then been passed. Under the laws of Great Britain then in effect he also possessed British nationality by parentage. This created a conflict in citizenship, frequently described as 'dual nationality.' The American law makes no provision for the election of nationality by an American national by birth possessing dual nationality. As Robert A. G. Mackenzie was by birth an American national, he could neither divest himself of the rights of an American citizen, save through expatriation by becoming a naturalized citizen of a foreign state in conformity with its laws or possibly by taking an oath of allegiance to a foreign state. So far as disclosed by this record the right of expatriation was never exercised by him. He therefore remained an American citizen.

Relation to Americans in Foreign Countries.—Judge Parker proceeded to discuss various statements of Secretaries of State concerning election of a foreign nationality in cases of persons born in the United States of alien parents, and expressed the opinion that these statements related to loss of right to the protection of the United States in the other countries claiming the allegiance of the individuals concerned and not to actual loss of American nationality. In this connection he made the following observation:

> Much might be said in favor of adoption by the United States and other nations of a multilateral treaty, supplemented by municipal legislation, looking to the abolition of dual nationality or its termination through enforced election under appropriate restrictions. But it is not competent for this international tribunal to consider what the municipal law of the United States with respect to its citizenship should be, but only to find and declare that law as it is, to the extent necessary to determine the jurisdiction of this Commission and the liability of Germany under the Treaty of Berlin.

The conclusions reached by Judge Parker in this case were similar to those reached by the present writer in his article on "Dual Nationality and Election," which appeared in the *Yale Law Journal* for April and May, 1921 (Volume XXX, Nos. 6 and 7), in which decisions of courts and pronouncements of the Department of State concerning this subject were discussed at some length.

PROPOSED PAN AMERICAN CONVENTION

The question of dual nationality was discussed by the writer before the American Society of International Law in Washington on April 24 last, with regard to a proposed Pan American Convention for preventing dual nationality, which was drafted at Lima by the Institute of International Law. This discussion was printed in the proceedings of the American Society of International Law, April 23-25, 1925, pages 69-78.

The proposed Pan American Convention provided that nationality should depend entirely upon place of birth, under the *jus soli,* although it was also provided that individuals born in one of the American Republics of nationals of another Republic might, when they had reached their majority, adopt the nationality of their parents.

DIFFICULTIES OF THE SITUATION

It is obvious that dual nationality at birth * would cease to exist if the various countries of the world should agree that nationality should be based entirely upon either place of birth or nationality of parents. At present the laws of all countries contain provisions under which, within certain limitations, an individual is claimed as a national of a country, wherever he may be born, because his father is a national thereof. A number of countries, including the United States, Great Britain, and countries of Latin America, also claim as their nationals all persons born within their territory and jurisdiction.

In view of the large number of American citizens who reside in foreign countries for business or pleasure, or as missionaries of American churches, or representatives of American organizations of various kinds, it seems doubtful that Congress would deem it proper to repeal Section 1993 of the Revised Statutes, under which a person born abroad of an American father is born an American citizen, provided his father has resided in the United States at some time. In this connection it will also be necessary to consider the status of children born abroad of American consuls.

---

* The Government of the United States does not admit the existence of dual nationality in cases of persons who have been naturalized in this country.

Perhaps a satisfactory rule would be one under which an individual would be regarded as a national of a country because of his birth within its territory, provided his parents are domiciled therein at the time of his birth. Such a rule, however, would require an amendment to the provision of the Fourteenth Amendment to the Constitution of the United States, which states that:

> All persons born or naturalized in the United States and subject to the jurisdiction thereof are citizens of the United States.

POSSIBLE MULTILATERAL AGREEMENTS

If it is impossible to prevent dual nationality from arising by the adoption of uniform nationality laws in all countries, it may still be possible for the various countries to enter into a multilateral agreement under which dual nationality may be terminated when the individuals concerned reach their majority or shortly thereafter.* It might be agreed, for example, that an individual who has dual nationality shall cease to be a national of either country upon reaching his majority or one year thereafter if at such time he is domiciled in the other country concerned. The loss of nationality of either country should be made to depend upon the acts of the individual concerned, rather than upon mere declarations.

PASSPORT REGULATIONS

By Richard M. Flournoy, Jr.
U. S. Department of State

Period of Validity Increased.—It was provided in the Diplomatic and Consular Appropriation Act of June 4, 1920, that the validity of passports should be limited to two years unless the Secretary of State should by regulation limit it to a shorter period. At first the validity of passports was limited to one year, with right of renewal for one year more, but, by an order of May 7, 1925, the initial validity was extended to the full period of two years.

Visa Fees Reduced or Abolished.—The Act of Congress just mentioned also prescribed a fee of $1 for the execution before a consul of an application for a visa of the passport of an alien coming to this country and an additional fee of $9 for the visa. This applied to visas of temporary visitors as well as to those of immigrants. Most foreign countries retaliated by increasing the visa fee required of Americans entering their territories, with the result that the expense of extensive foreign travel by Americans was greatly increased.

Therefore, Congress passed an act, approved by the President February 25, 1925, authorizing the President to "reduce such fees or to abolish them altogether, in the case of any class of aliens desiring to visit the United States who are not 'immigrants' as defined in the Immigration Act of 1924, and who are citizens or subjects of countries which grant similar privileges to citizens of the United States of a similar class visiting such countries."

Agreements for Reduction.—Under the authority of the statute mentioned agreements for mutually reducing or abolishing visa fees in cases of non-immigrants have been made with the following countries—Bulgaria, Costa Rica, Denmark, Guatemala, Nicaragua, Esthonia, Germany, Salvador, Siam, Mexico, Liberia, and Finland. No visas are required for visiting Switzerland, Panama, Honduras, Nicaragua, Esthonia, Siam and Liberia.

---

* There are now several bilateral treaties of this kind, and the statutes of a number of countries contain provisions under which dual nationality may be terminated.

New Rule for Overcoming Statutory Presumption of Expatriation.—On March 2, 1925, the Department of State issued an order amending the regulations under which may be overcome the presumption of loss of citizenship arising, under Section 2 of the Act of March 2, 1907 (34 Stat., Pt. I, 1228), against a naturalized citizen who has "resided for two years in the foreign state from which he came, or for five years in any other foreign state." The statute provides "that such presumption may be overcome on the presentation of satisfactory evidence to a diplomatic or consular officer of the United States, under such rules and regulations as the Department of State may prescribe."

Comparison with Former Rules.—The former rules provided that the presumption could be overcome by the persons concerned upon their showing that they had an intention of returning to the United States to reside and that they had been residing abroad as representatives of American trade and commerce, or for health or education, or as representatives of American educational, scientific, philanthropic or religious organizations, or because they had been prevented by some unforeseen exigency from returning to this country. There was also a special rule applicable to persons residing in nearby countries. A new rule was added, providing that the presumption could be overcome by naturalized citizens upon their showing:

> (e) That they reside in a country other than that from which they came and are principally engaged in some legitimate professional or scientific occupation, not inconsistent with American interests and for which occupation they were trained in American institutions; that they maintain effective ties with the United States, and that they intend eventually to return to the United States permanently to reside.

Professional Men.—The new rule, which has no application to naturalized citizens residing in their native lands, was intended principally for the benefit of mining, electrical and civil engineers and for dentists, physicians and other professional men, whose occupations carry them to various quarters of the earth.

Relation to Women.—It may be observed that the rules mentioned are applicable also to American women who have married aliens eligible to citizenship * since the passage of the married women's nationality Act of September 22, 1922 (42 Stat. Pt. I, 1021) and who, having resided for two years in the countries of which their husbands are citizens or subjects or for five years elsewhere outside of the United States, have brought upon themselves the presumption of expatriation under the provision of Section 3 of the Act.

LIMITATIONS ON NATURALIZATION

By Richard M. Flournoy, Jr.
U. S. Department of State

Permanent Residence Abroad.—During the year the courts have in a number of cases issued decrees, under the provision of the second paragraph of Section 15 of the Naturalization Act of 1906, canceling, as void *ab initio*, the naturalization of aliens who, within five years after the dates of their naturalization established a permanent residence abroad. Proceedings in these cases are begun with reports, in the form of certificates, furnished by consular officers. The statutory provision in question has been very useful in enabling the Government to weed out bad naturalization cases, thus relieving the Government of the task of extending, or attempting to extend, protection to persons who are not really entitled to it.

The theory embodying this law is that citizenship involves obligations as well as privileges and that lawful naturalization implies an intention on the part of the person naturalized to reside permanently in the United

---

* Those who marry aliens "ineligible to citizenship" thereby immediately lose their American citizenship, under Section 3 of the Act.

States. The acquisition of a permanent residence abroad within the period of five years after naturalization raises a presumption under the law that such intention did not exist at the time of naturalization. The statute has been held to apply to naturalizations obtained before its passage as well as to those obtained thereafter. (See Luria v. United States, 231 U. S. 9. The opinion of Mr. Justice Van Devanter in this case contains an excellent discussion of the juridical basis of the statute.)

In recent years, especially since the close of the World War, consular officers have furnished hundreds of reports in pursuance of the statutory provision just mentioned. A great majority of these reports related to persons of Italian birth who had returned to Italy to reside. This has been due largely to a custom prevalent among Italians to leave their wives and children in Italy, while they themselves reside alternately in Italy and the United States. In many cases Greeks and Syrians have also come within the operation of this statute.

WHO ARE WHITE PERSONS?

The Statute.—Within the past year the courts have rendered several decisions involving the important question whether certain aliens of Asiatic birth could be regarded as "white persons" under the naturalization law. (Rev. Statutes, Sec. 2169. The provisions of this Title shall apply to aliens [being free white persons, and to aliens] of African nativity and to persons of African descent.) Because of the vagueness of phraseology of the statute and of the fact that differences between various races are not sharply defined, this question has always been more or less puzzling to the courts.

Aliens Ineligible to Citizenship.—It has been rendered more important than ever by the inclusion in the Immigration Act of 1924 (Section 13b), of the provision that aliens "ineligible to citizenship," with certain limited exemptions, shall not be admitted to the United States. By this provision the laws concerning immigration and naturalization have been made to coincide. Taken together they show clearly that it is not the intention of Congress that the United States shall be a melting pot for persons of any and all races.

By these statutes a distinction is drawn between receiving aliens as visitors and receiving them as permanent members of the political community or citizenship of the country. As visitors the gates are open, regardless of race or color, but as to aliens coming for permanent residence Congress has shown by the legislation referred to that it is deemed necessary to ascertain whether such aliens belong to races the members of which will, as a rule, be readily and naturally assimilated, especially through marriage, into the citizenship of the country. This depends upon no scientific theory. Experience is the test, and experience has shown that persons belonging to races widely separated ethnologically from the body of the inhabitants of the country will not be readily and naturally assimilated, even though they may have attained a high degree of civilization. Even those who consider first the ultimate good of mankind, rather than the immediate needs of this country, will find it a hard task to prove that the good of mankind will in the end be served by the free admission into the United States of elements which are unassimilable.

African Descent.—When Congress, by the Act of July 14, 1870, extended the privilege of naturalization to aliens "of African nativity and to persons of African descent," it evidently had in mind African negroes, that is, aliens belonging to the same race as the former slaves. It is an interesting question whether a person born in Africa of Chinese or Hindu parents is entitled to naturalization as a person "of African nativity."

Arabian vs. Hindu.—In the course of his opinion in the case of United States v. Ali (supra), Judge Tuttle said:

> Although the defendant herein was, as already noted, referred to by all parties concerned with his naturalization as a high-caste

Hindu, and was admitted to citizenship on that understanding, in which he then appeared to acquiesce, he now claims that the last-cited decision of the Supreme Court does not apply to him, for the reason that he is not a 'Hindu' of full Indian blood, but is an Arabian of full Arabian blood. While admitting that he is a native of India, as his ancestors for several centuries have also been, he contends that originally his ancestors were Arabians, who invaded the territory now known as India, and settled and remained there, but have been careful not to intermarry with 'the native stock of India,' and have 'kept their Arabian blood line clear and pure by intermarriage within the family.' I am unable to follow the argument thus sought to be made. No reason has been suggested, and I can discover none, why the mere fact that the early ancestors of the defendant came to India from Arabia, where they had been called Arabians, renders the defendant a white person. His skin is certainly not white, but unmistakably dark, like that of the other members of his race. He is a native of the continent of Asia, specifically of the country of India, and more specifically of the province of Punjab, the place of the nativity of the alien held, in the case of the United States v. Bhagat Singh Thind, supra, not to be a white person. Clearly, all of the conclusions of the Supreme Court in that case, as well as the reasons on which they are based, are equally applicable to this defendant. He admits that his ancestry, like that of other races residing in India, originally sprang from Caspian Mediterranean stock. It would seem that the most that could be claimed by him, by reason of Arabian ancestry, would be membership in the Caucasian race. This, however, manifestly would avail him nothing, under this decision of the Supreme Court.

"What Is a White Person?"—In United States v. Bhagat Singh Thind, 261 U. S. 204, referred to in the opinion just quoted (opinion written by Justice Sutherland), it was held by the Supreme Court that a high caste Hindu of full Indian blood born in the Punjab, was not a "white person" within the meaning of the law and that his naturalization was unlawful and void.

In Ozawa v. United States, 260 U. S. 178, the court had held that a Japanese was not a "white person" and was, therefore, ineligible to naturalization. Justice Sutherland, in rendering the opinion, had observed that it was the intention of the Congress which framed the naturalization law "to confer the privilege of citizenship upon that class of persons whom the fathers knew as white, and to deny it to all who could not be so classified."

Caucasian Race.—It had also been stated in this opinion that "the words 'white person' were meant to indicate only a person of what is popularly known as the Caucasian race." In the Thind case, however, attention was called to the fact that the statute itself "does not employ the word 'Caucasian' but the words 'white persons,' and these are words of common speech and not of scientific origin." . . .

They imply, as we have said, a racial test; but the term 'race' is one which, for the practical purposes of the statute, must be applied to a group of living persons *now* possessing in common the requisite characteristics, not to groups of persons who are supposed to be or really are descended from some remote, common ancestor, but who, whether they both resemble him to a greater or less extent, have, at any rate, ceased altogether to resemble one another. It may be true that the blond Scandinavian and the brown Hindu have a common ancestor in the dim reaches of antiquity, but the average man knows perfectly well that there are unmistakable and profound differences between them today; and it is not impossible, if that common ancestor could be materialized in the flesh, we should discover that he was himself sufficiently differentiated from both of his descendants to preclude his racial classification with either. The question for determination is not, therefore, whether by the speculative processes of ethnological reasoning we may present a probability to the scientific mind that they have the same origin, but whether we can satisfy the common understanding that they are now the same or sufficiently the same to justify the interpreters of a statute—written in the words of common speech, for common understanding, by unscientific men—in classifying them together in the statutory category as white persons. (Pp. 209-210.)

Justice Sutherland mentions various writers on ethnology, including Deniker (*Races of Man*), Keane (*Man: Past and Present*), Huxley (*Man's Place in Nature*), and the *Dictionary of Races* (Sen. Doc. 61 Cong., 3d Sess., No. 662), and shows that scientists do not agree as to the divisions of races. He observes that the Aryan theory as a racial basis seems to be discredited by most, if not all, modern writers on the subject of ethnology, and that "the word 'Caucasian' is in scarcely better repute. It is at best a conventional term, with an altogether fortuitous origin, which, under scientific manipulation, has come to include far more than the unscientific mind suspects." Because the court in the Ozawa case held that a person who is not what is commonly known as a "Caucasian" is not entitled to naturalization, it does not necessarily follow that every person who may be regarded as a "Caucasian" is a "white person" within the meaning of the law. As to the true meaning of the words "white person," the learned judge said:

> The words of familiar speech, which were used by the original framers of the law, were intended to include only the type of man whom they knew as white. The immigration of that day was almost exclusively from the British Isles and Northwestern Europe, whence they and their forbears had come. When they extended the privilege of American citizenship to 'any alien, being a free white person,' it was these immigrants—bone of their bone and flesh of their flesh—and their kind whom they must have had affirmatively in mind. The succeeding years brought immigrants from Eastern, Southern and Middle Europe, among them the Slavs and the dark-eyed, swarthy people of Alpine and Mediterranean stock, and these were received as unquestionably akin to those already here and readily amalgamated with them. It was the descendants of these, and other immigrants of like origin, who constituted the white population of the country when Sec. 2169, reenacting the naturalization test of 1790, was adopted; and there is no reason to doubt, with like intent and meaning. . . .
>
> What we now hold is that the words 'free white persons' are words of common speech, to be interpreted in accordance with the understanding of the common man, synonymous with the word 'Caucasian' only as that word is popularly understood. As so understood and used, whatever may be the speculations of the ethnologist, it does not include the body of people to whom the appellee belongs. It is a matter of familiar observation and knowledge that the physical group characteristics of the Hindus render them readily distinguishable from the various groups of persons in this country commonly recognized as white. The children of English, French, German, Italian, Scandinavian, and other European parentage, quickly merge into the mass of our population and lose the distinctive hallmarks of their European origin. On the other hand, it cannot be doubted that the children born in this country of Hindu parents would retain indefinitely the clear evidence of their ancestry. It is very far from our thought to suggest the slightest question of racial superiority or inferiority. What we suggest is merely racial difference, and it is of such character and extent that the great body of our people instinctively recognize it and reject the thought of assimilation. (Pp. 213-215.)

While Congress, in using the phrase "white persons," seems to have had in mind principally persons of European stock, Justice Sutherland in the Thind case took care to state that the decision of the court therein did not necessarily mean that no persons of Asiatic birth are eligible to naturalization.

Cases Cited.—The question under consideration was also involved in the case of United States v. Cartozian, District Court for the District of Oregon, July 27, 1925, 6 F (2d) 919, in which it was held that an Armenian was a "white person" and entitled to naturalization as such. In deciding this case Judge Wolverton considered not only the opinions of historians and anthropologists, from Herodotus and Strabo to Professor Franz Boas of Columbia University and Professor Rohrbach of Berlin, as to the origin and racial character of the Armenians, but he also considered the testimony of a number of expert witnesses having special knowledge of Armenians gained through actual contact with them and thorough study of their characteristics and customs. Among these witnesses were Professor Dixon of Harvard, Dr. Barton, former Secretary of the American Board of Commissioners for Foreign Missions, and Mr. Vartan Malcolm, an attorney of New York City of Armenian origin. The latter testified that, according to the Census of 1920, there were then in the United States 52,840 persons of Armenian birth or parentage, of whom 10,574 were naturalized. As to the question of their being readily assimilated, he testified that an examination of 339 Armenian men showed that 257 were married, 125 to Armenian girls and 132 to native white Americans and Europeans. The conclusion of the court was summed up as follows:

> The testimony here adduced would seem to meet the concept essential to eligibility for naturalization under section 2169, R. S., first, that Armenians in Asia Minor are of the Alpine stock, of European persuasion; second, that they are white persons, as commonly recognized in speech of common usage, and as popularly understood and interpreted in this country by our forefathers, and by the community at large, when section 2169 was adopted by Congress, and later confirmed; third, that they amalgamate readily with the white races, including the white people of the United States. (P. 922.)

The case of Hidemitsu Toyota v. United States, decided by the Supreme Court on May 25, 1925, involved the question whether the naturalization of a Japanese who had served in the Coast Guard, a part of the naval forces of the United States, between the years 1913 and 1923 and had received a number of honorable discharges, was lawful under the provision of Section 4 of the Act of June 29, 1906, as amended by the Act of May 9, 1918, c. 69, 40 Stat. 542, or under the Act of July 19, 1919, c. 24, 41 Stat. 222, or whether the provisions of Section 2169 of the Revised Statutes made his naturalization unlawful. The Acts of Congress mentioned provided for the naturalization of aliens who had served in the armed forces and had been discharged therefrom without the necessity of their proving a residence of five years in the United States.

In Ozawa v. United States, 260 U. S. 178, the Supreme Court had held that the naturalization of a Japanese was unlawful because he could not be regarded as a "white person," within the meaning of R. S. 2169. The Supreme Court held in the Toyota case that the limitations of R. S. 2169 were applicable to discharged soldiers and sailors, as well as other aliens, and that the naturalization of Toyota was unlawful and void.

FREEDOM OF OPINION AND EXPRESSION

By Walter Nelles

Of the New York Bar

Wilson's Prediction.—Early in 1917, his war message written but not yet transmitted, Woodrow Wilson sent for his friend Frank Cobb, the editor of the New York World, apparently to ease his mind a little on the hard necessity of war which must strike down the ordinary privileges of free speech and press. "Conformity would be the only virtue," said the President, "and every man who refused to conform would have to pay the penalty." He thought the Constitution would not survive it; that free speech and the right of assembly would go. He said that a nation couldn't put its strength into a war and keep its head level; it had never been done.

Effect on Straight Thinking.—The prediction was justified; and the "mobilization of the mind of America" worked so well that it has left that organ still somewhat incapacitated for independent thinking. It is easy for a prejudice to prevail by its mass. Perhaps, indeed, the greatest, if not the only, value of extremist doctrines which offer themselves as targets for repression—Bolshevism, for example—is their stimulation of more moderate thinking about the breakdown of social health which they reflect. While taboos of extremist views prevail, moderate opinion in the same field scarcely dares expose itself to the danger of assimilation. At present organized propagandas attribute to the concealed influence of Moscow not alone libertarian protests against the prosecution of Bolshevists in America for advocacies without action, but even such extremely humanitarian proposals as the Child Labor Amendment.

Silencing Visitors.—The anti-radical taboo remains, both strong and undiscriminating. The mild and moderate Mr. Arthur Henderson was prevented, October 23, at the instance of the National Security League, from addressing a Y. M. C. A. at Hartford. The State Department has lately refused passport visas to Mr. Saklatvala, a Communist member of the British Parliament, and to the Countess Karolyi. In the spring Count Karolyi was admitted to the United States only upon his promise of political silence. In the case of Saklatvala there may possibly have been a presumption that his views are such as disqualify him by law from visiting the United States. Those in a position to know are positive that the Countess Karolyi's views are not of such a character. In both cases the State Department's investigation was *ex parte*, and in neither case has a fact basis for its ruling been disclosed.

War Time Court Decisions.—War cases had previously emasculated the conception of free speech as a constitutional right, holding, for example, that verbal opposition to the war might be punished, upon supposition of its tendency to bring about obstruction of recruiting, even without tangible evidence that recruiting was obstructed (Schenck v. U. S., 249 U. S. 47). Justice Holmes at that time managed to save the point that speech was not punishable for itself, but only when "the words used are used in such circumstances and are of such a nature as to create a clear and present danger that they will bring about substantive evils that the State has a right to prevent."

Gitlow Advocacy Case.—June 8, 1925, the Supreme Court settled contrary to libertarian contentions, the main principle of constitutional law as to the punishment as crimes of immoderate radical advocacies (Gitlow v. New York, 45 Sup. Ct. 625, Dissenting by Justices Holmes and Brandeis).

The New York statute involved in the Gitlow case, like the "criminal syndicalism" laws of other states, undertakes to punish advocacy (in the particular case, of general strikes to bring about proletarian dictatorship) for itself, irrespective of circumstances in which it might entail "clear and present danger." "Whatever may be thought," said Justice Holmes, "of the redundant discourse before us it had no chance of starting a present conflagration."

The majority of the court held, however, that such advocacies involve danger "by their very nature"—danger which the State cannot be required to measure in each instance "in the nice balance of a jeweler's scale." The court refused to weigh any compensating public interest in tolerating immoderate advocacies as a barometer of the discontents from which they spring and stimulus to sober reflection, or to admit any analogy between prosecutions for such advocacies and the eighteenth century prosecutions for sedition by which our constitutional guarantees of free speech and press were inspired.

Pardons.—Gitlow was pardoned by Governor Smith of New York, December 11, on the ground that he has been "sufficiently punished for a political crime." Except in Pacific Coast States (and a few cases elsewhere still pending on appeal) all persons convicted of "criminal syndicalism" and the like have now been released by pardon, commutation, or expiration of sentence, and no new prosecutions for doctrines are being instituted. Some seventy persons are still serving sentences for "criminal syndicalism" in California.

Punishments for Association.—Another important constitutional question—that of the validity of the "guilt by association" sections of "criminal syndicalist" laws—is raised by the case of Miss Charlotte Anita Whitney, long known for devoted zeal in social service, who was convicted in California solely for association with radical organizations; there was no evidence that she had personally emitted any proscribed doctrine. Since dismissing her appeal on the ground of want of jurisdiction on October 19 the Supreme Court Bar on December 14 directed a re-arrangement which will include both the technical question of its jurisdiction and the merits of the case.

In that state criminal prosecutions have to some extent been replaced by summary punishments under an extraordinary injunction which in effect makes "criminal syndicalism" a contempt of court (see Matter of Wood, 227 Pac. 909). In the State of Washington Elmer Smith, an attorney, was disbarred on February 24 (two judges dissenting) for speeches held to amount to advocacy of I. W. W. principles; in the same State, membership in the I. W. W. has been held a bar to naturalization (In re Olson, 4 Fed., 2nd, 417).

Strike Cases.—Elsewhere than on the Pacific Coast, by far the greatest number of interferences by public authority with freedom of expression have been in cases of strikers. In West Virginia 138 strike pickets were arrested in May for contempt of injunctions. In Illinois an anti-injunction law, passed in June, has been sustained by a court at Chicago (see also, Vulcan Detinning Co. v. St. Clair, 145 N. E. 657). In many parts of the country meetings of strikers have been prevented or broken without proof that the meetings were unlawful. For attempting, over police objection, to hold a meeting of protest against such suppressions, Roger Baldwin, director of the American Civil Liberties Union, and seven others were on March 31 found guilty at Paterson, N. J., of unlawful assembly.

Ku Klux Klan Cases.—Demonstrations for nativism, as represented by the Ku Klux Klan, have in several instances been disrupted by mobs. And meetings offensive to Klansmen have been objects of mob violence in regions where the Klan is powerful. In the December *Forum* Dr. Hiram W. Evans, Imperial Wizard of the Klan, states frankly its basic doctrine "that the pioneers who built America bequeathed to their own children a priority right in it, the control of it and of its future, and that no one on earth can claim any part of this inheritance except through our generosity." Nativism is obviously an expression of the same primitive instinct as Bolshevism—the instinct to power for oneself, one's own family, tribe, gang, or class. At the same time we crush the punier "will to power" that expresses itself in clamor for an "industrial mass action."

Oregon School Cases.—One of the first fruits, it is generally believed, of the political power of the Ku Klux Klan was the Oregon statute making it compulsory for children to attend the public schools. The Supreme Court held unanimously on June 1 that this act was unconstitutional (Pierce v. Society of the Sisters of the Holy Name; Same v. Hill Military Academy). The court said: "The fundamental theory of liberty upon which all governments in this Union repose excludes any general power in the State to standardize its children by forcing them to accept instruction from public teachers only."

Evolution Cases.—While the Klan on the one hand tries to herd all children into the public schools, it likewise advocates state laws forbidding the teaching of evolution in institutions supported by public funds.

Of the resulting statutes, that in Tennessee has been the object of particular attention. It makes it criminal to teach, in an institution supported by public funds, "any theory that denies the story of Divine Creation of man as taught in the Bible, and to teach instead that man has descended from a lower order of animals." John Thomas Scopes taught a high school class at Dayton, from a text book prescribed by the State, "that the earth was once a hot, molten mass, too hot for plant or animal life to exist upon it; the earth cooled, the sea formed, and a little germ of one cell organism was formed in the sea; this kept evolving till it got to be a pretty good sized animal, then came on to be a land animal, and it kept evolving and from this was man." Amid prayers and oratory Scopes was tried and found guilty in July. Evidence offered to show the nature of evolutionary doctrine and the indefiniteness of the Biblical teaching was excluded as irrelevant. (See Leslie H. Allen, *Bryan and Darrow at Dayton.*)

The principal constitutional objections on appeal are (1) that the statute gives a preference to Fundamentalist religious establishments and is otherwise discriminatory; (2) that the legislative power over the curriculum of public instruction is exceeded by a requirement to falsify a branch of science authorized to be taught. Bryan's contention (not unmixed, to be sure, with appeals to literalist faith) is that the statute does not in any way attempt to make the Bible the "yardstick of learning;" it simply expresses the people's will that their public funds shall not be used for teaching that conflicts with it.

Perhaps the most reassuring utterance of the year, indicating as it does response to public opinion as well as an attempt to lead it, was this of President Coolidge before the American Legion October 6: "It is the ferment of ideas, the clash of disagreeing judgments, the privilege of the individual to develop his own thought and shape his own character, which makes progress possible. It is not possible to learn much from those who uniformly agree with us."

BOLSHEVISM IN THE UNITED STATES

By Benjamin Stolberg

Journalist and Publicist, New York

NATURE OF THE MOVEMENT

The largely nonsensical character of practically the entire literature on American Communism, whether put out by the Bolsheviks or by the Bolshephobes, is due mainly to their common basic assumption that Bolshevism in the United States is a genuine social movement. Strictly speaking, it is not a *movement* at all, for it lacks the requisite indigenous cultural background. It is a *mirage*, refracted by the Bolshevik revolution across half the globe from an almost incommensurate industrial culture and a completely disparate national history. Hence the need of continuous and sensitive reference to its Russian sources.

The Communist group in this country is very sharply delimited, in spite of such catch words as "parlor Bolshevik" and other brummagem terms which connote its wide and camouflaged diffusion through American society. It is organized into a highly disciplined political party — the "Workers' Party," which is avowedly under the dictatorial mandate of the Communist International. The Party's aim is to train its members into professional revolutionaries, expert in the technique of "Leninism," which comprises a series of revolutionary "steps" toward the Communist Atlantis. First the Workers' Party means to "capture" our labor movement (on which task it is now supposedly engaged). With this "class-conscious proletariat" it would proceed to "capture" the capitalist state (or rather, one must suppose, the Federal Government and the 48 states). Finally, the victorious revolutionary leaders ("the intelligent militant minority") would establish the Proletarian Dictatorship, which is to "wither" in the exact proportion in which it habituates the American people to a life of Communist brotherhood in syndicalist guilds. This fantastic objective is the literal program of the Workers' Party. But the exigencies of American life force it to shift constantly from this extreme state syndicalism (Bolshevism) to mild third party action; which reversals it rationalizes in "party theses," all couched in a strictly Bolshevik vocabulary.

The Workers' Party was openly organized in December, 1921, as a fusion of several secret Communist sects, which had split from the Socialist Party in 1919. At its fourth annual convention in Chicago in August, it reported a national membership of a little over 20,000: its actual dues-paying membership was 16,200, an increase of almost 5,000 since its organization. It is organized into 17 language federations, since most of its members are foreign-speaking and a still larger percentage are non-citizens. At this moment the Party is trying to reorganize, or at least to cross-organize, on the more indigenous basis of "shop nuclei" in order to acquire a more American complexion.

By far the largest and most conservative constituency are the Finns, whose strong coöperative societies have joined the Party in a body. They number about 6,500. The next largest group are the Russian Jews, mostly in the needle trades. They number about 2,000, out of almost 250,000 Jewish workers in the clothing industries. But these Jewish Communists exercise a disproportionately strong influence on the Jewish workers, whose long militant tradition against the sadism of the Czarist regime, naturally renders them sympathetic to their revolutionary fatherland. Then come the South

Slavic, the Lithuanian, the Russian and English-speaking federations, with a membership of a little over 1,000 each. The other federations, with a membership of from 500 down to 80 in the order of their size, are the Ukrainians, Czechoslovaks, Letts, Italians, Hungarians, Poles, Germans, Scandinavians, Greeks, Rumanians and Esthonians.

Most of the Party's present income comes from its supporters in this country. The average member contributes about $12 a year, which gave the Party during the last fiscal year $195,000, but of this $33,000 plus $47,000 for assessments and donations goes to the national office. Its corresponding expenditures were $180,000; the deficit of $100,000 was made up by the Communist International.

The Party maintains 23 newspapers—daily, semi-weekly and weekly—and also the *Workers' Monthly*, which reach a combined reading public of 2,400,000. The Party press costs in round numbers about $750,000; the average member pays from $15 to $20 annually on this account.

The 1925 convention of the Party enlarged its Central Executive Committee from 13 to 21 members. William Z. Foster was reëlected to the national chairmanship, which office has since been abolished by Zinoviev. But he is still on the enlarged Executive Committee of the Comintern, with Charles E. Ruthenberg, who has been the national secretary of the Party since 1921.

FOSTER'S EXPERIENCE

There is no better way of analyzing the present struggle within American Bolshevism than by sketching the career of Foster since he assumed its leadership in 1921. Since then he has changed his position on at least five different occasions, every time against his own judgment and at the behest of the Communist International.

Foster is singularly gifted in the attributes of leadership save one, which is fatal. He is the prey of the "lunatic fringe" of his own radical efforts. He was expelled from the Socialist Party in 1909. He quit the I. W. W. in 1911. His Syndicalist League of North America died after a few months of existence in 1912. His International Trade Union Educational League died the same way in 1916. He lost out in the American Federation of Labor even before the collapse of the 1919 steel strike which he had organized. Every time he failed because he knew what he wanted and then impatiently disregarded his own judgment.

He is fundamentally a syndicalist. He wants to amalgamate the trades in each industry into one union. He always has been and is now against political action. Yet, today he is one of the leaders of a political party, which is syndicalist in Russia but necessarily divisive here. He knows that this "drive toward industrial unionism" is an arduous job. Hence his slogan of "boring from within the masses of American labor." But he finds "boring" far too slow. And so he scares these "masses" by revolutionary chimeras which effectively keep him "boring" on the "outside looking in."

In 1920 Foster founded his third syndicalist effort, the Trade Union Educational League, which is now the "industrial department" of the Workers' Party and is affiliated with the Red International of Labor Unions. In his need for moral and financial support he turned, early in 1921, to the recently organized Communist International. The syndicalist character of the Russian revolution completely swept him off his feet. He went to see the Russian leaders, who received him graciously, partly on account of his long and sincerely militant radical career, partly because he was an intellectual working man of Yankee-Scotch-Irish descent. Most of the Communists in this country then were neither workers nor intellectuals nor Americans. The Communist International has been partly financing his activities ever since.

After sundry vicissitudes in the "underground" Communist factions through 1921, he assumed the leadership of the Workers' Party on its formation. By 1923 the Party was well organized, and it began to play its "revolutionary strategy" in our labor movement. Its first "step," under the real direction of Pogany, alias Pepper, the then resident agent of the Communist International with the Workers' Party, at the direction of Zinoviev, and against his own judgment, was "to capture the united labor ticket" of the Farmer-Labor Party which met in convention in Chicago in July, 1923. Thereby he drove out all the responsible trade unionists whom he wished to hold.

The Communists organized a fictitious Federated Farmer-Labor Party, thus bluffing "a united front with American Labor" in the hope of being allowed to join the incipient La Follette movement. Foster hoped against hope that La Follette might permit endorsement by the Federated Farmer-Labor Party, which was to meet in Presidential nominating convention in June, 1924, in St. Paul. Of course La Follette repudiated the fake party. Meanwhile Zinoviev cabled early (May, 1924) that the Federated Farmer-Labor Party was to be torn up. Foster's last hope of "boring from within" went glimmering; but he "complied." The Federated Farmer-Labor Party was thrown into the waste basket. And Foster was even weak enough to become the presidential candidate of the Workers' Party, running on a "revolutionary platform" for the White House.

RUSSIAN BOLSHEVISM

Ever since the Soviet revolution the tasks of the Russian government and of the Russian Communist Party have been clearly contradictory. The job of the Soviet government has been all along to deal realistically with Russian national life and its foreign, especially commercial, needs. The job of the Communist International (which is really but an enlargement of the Russian Bolshevik Party) is utopian—international social revolution. Lenin's genius was able to make very effective use of these two contradictory tendencies. Zinoviev, whose own political fortunes are all tied up with the Communist International, protested that Bolshevism must not compromise its international revolutionary ideal. He was being blamed for the failures of the Communist uprisings in Germany, 1918 and 1922, in Italy, 1920, in Hungary in 1919 and in Bulgaria in 1923. Finally, in January, 1925, the situation came to a break in the Russian Communist Party. Trotzky openly accused Zinoviev of revolutionary incompetence and advocated the subservience of the Russian Communist Party, meaning by that also the Communist International, to the interests of Russian industrial and commercial realities.* Trotzky's position was branded as "Trotzkyism," "counter revolutionary" and "opportunistic" and he lost his cabinet position.

AMERICAN RIVALRIES

The reflection of this struggle in Russia threw the Workers' Party into fantastic convulsions. The American Bolsheviks were forced to split into two groups. One faction advocated "in the name of Leninism," "the further Bolshevization of the Workers' Party" or, in plain English, purely economic propaganda among the Trade Unions for One Big Unionism, for strikes, for the revolt against the present labor leadership and for the rest of the syndicalist program. The other faction was still for "a fake united front in the political field with American labor." This faction also wrapped itself in the mantle of "Leninism." Both factions bitterly reviled "Trotzkyism." And in order to have a Trotzky to revile they created one in the person of Ludwig Lore, editor of the *New Yorker Volkszeitung,* the German Communist daily.

AMERICAN PROGRAMS

Foster came out "for the further Bolshevization of the Workers' Party." He saw a chance to revert to his syndicalist tendencies and to push his Trade Union Educational League, which became active in disruptive campaigns in the International Ladies' Garment Workers'

---

* Zinoviev, however, was more realistic than Trotzky in advocating the policy of opportunistic pacification of the Russian peasant.

Union, among the shop crafts, the miners, the shoe workers and other trade unions. His program became known as the "Majority Program," because he had two thirds of the Central Executive Committee with him and about three fourths of the membership of the Workers' Party by national referendum. Ruthenberg headed the "Minority Program," which was going to "unite" with American labor in the political field, though American labor refused to "unite" with the Communists. Both factions joined in vilifying Ludwig Lore's "Trotskyism." Foster and Ruthenberg and other Communist leaders made several pilgrimages to Moscow. The Communist International finally appointed a Lett named Grusev, Americanized into Green, to come over and to adjudicate the quarrel as chairman of a "parity committee" created for that purpose.

In mid-summer 1925 the Communist International issued a lengthy statement on "the American Question." Oracularly it gave its blessings to both factions, which both factions avidly interpreted as an "endorsement." It directed the repudiation of Lore, and with him went the German Communist press and most of its German constituency. The real struggle for power between Foster and Ruthenberg began. Foster relied on the clear referendum victory of his Majority Program.

RUSSIAN INTERPOSITION

He was having his way when on August 28 the cable reached the convention from Zinoviev: "The Communist International is highly dissatisfied with Majority. Minority closer to us and more communistic. Demand that Minority gets at least 40 per cent. representation on the Central Executive Committee and at least 50 per cent. on all committees and subcommittees. Non-compliance means expulsion." The referendum vote of the American Communists was overridden and Foster was slapped in the face. But he "complied."

Zinoviev feels now that "the minority is closer to us," in spite of its greater opportunism, because he had to compromise with his revolutionary orthodoxy at home. As was to be expected, the realistic tendencies of the Soviet government were bound to win out against the utopianism of the Communist International. Trotzky is very much back in office. Stalin, whose position as chairman of the Organization Committee of the Russian Communist Party gives him the whole patronage power of the government, is now definitely against Zinoviev. The Communist International is being forced to modify its red talk. Russia wants American recognition. She is now already doing almost 40 per cent. more business with this country than before the war. And so Zinoviev is telling his American comrades that they "need not demand nor even expect . . . immediately a revolutionary" movement in America.

The fact is that an intelligent radical program in American labor does not interest either Zinoviev or Losovsky, the secretary of the Red international of Labor Unions, who are the real dictators of the Workers' Party. All they want the Workers' Party to do is to make the kind of noise which to them is worth approximately $100,000 a year: to break up Socialist meetings, to propagandize disruptive "slogans" in our labor movement, to fish in the murky waters of our race problem, to stage "protest meetings" against this or that. Of course the very championship of any cause by the Communists hurts it in this country. But it makes good political hokum for Zinoviev and Losovsky in Russia, who thus can point to their international effectiveness. But whenever the political and trade relations between the United States and Russia are straightened out, the Workers' Party will undoubtedly find itself entirely left in the lurch by Moscow. Its moral and financial support will have to be wholly indigenous and chances are that it will decay into much the same sort of doctrinaire sectarianism which characterizes the Socialist Labor Party.*

---

III. CITIZENSHIP AND PERSONAL RIGHTS

STATISTICS OF NATURALIZATION AND CITIZENSHIP

By Richard M. Flournoy, Jr.
U. S. Department of State

Figures of 1925.—The statistics contained in the Report of the Commissioner of Naturalization for the year ended June 30, 1925, are interesting and in some respects surprising. A table (*Report*, p. 42) shows the number of aliens admitted to citizenship during the year, arranged by nationalities. It is surprising to find that the Poles head the list with 27,134, or 17.80 per cent. of the whole number, 152,457. Italy comes second with 26,137, or 17.14 per cent, the British Empire third, with 23,815, or 15.62 per cent., Russia fourth with 15,692, or 10.29 per cent., and Germany fifth, with 8,569, or 5.62 per cent. Only 1,030 Frenchmen were naturalized, or .68 per cent. of the total. Of Central and South Americans only 189 were naturalized, or .12 per cent., and of Mexicans only 101, or .07 per cent.

It is likely that in many cases naturalization was procured in order that the persons naturalized might be able to facilitate the entry of near relatives into the United States as non-quota immigrants, under the provision of Section 4 (a) of the Immigration Act of 1924, or as preferred quota immigrants, under the provision of Section 6 (a) (1) of the same Act.

Figures of 1920.—With relation to this matter it is interesting to note some of the figures contained in the Census of 1920.

Total population of the United States and outlying possessions	117,859,495
Population of Continental United States	105,710,620
White	94,820,915
Negro	10,463,131
All others	426,574
Native white	81,108,161
Native parentage	58,421,957
Foreign or mixed parentage	22,686,204
Foreign-born white	13,712,754
Naturalized	6,479,159
Unnaturalized	7,233,595

Race Figures.—The table in the 1920 Census showing the numbers of foreign-born persons in the United States and the percentage naturalized by countries of birth is very illuminating.

The contrast between the percentages of naturalization in cases of persons born in countries of Western and Northern Europe and the percentages of naturalization in cases of persons born in countries of Southern and Eastern Europe is striking.

Of the Welsh 72.9 per cent. were naturalized; the Germans come next with 72.8, Luxembourgers 72.5, Danes 69.2, Swedes 69, Norwegians 67.3, Irish 65.7, Swiss 64.9, English 63.1, Scotch 60.9. On the other hand the table shows that of the Russians only 40.2 per cent. were naturalized; of the Austrians 37.7, Hungarians 29.1, Italians 28.1, Poles 28, Yugoslavs, 25.2, Greeks 16.8, Portuguese 16.4, Bulgarians 12.1, Spanish 9.9, Albanians 7.4.

CHANGES IN ELECTORAL LAWS

By Charles Kettleborough
Director of the Indiana Legislative Bureau

The distinguishing characteristic of the laws enacted in 1925 relative to electoral procedure is the conspicuous absence of any important changes. Such modifications as have been effected relate exclusively to the more adequate functioning of electoral agencies which are already in existence.

Registration or Enrollment.—The changes effected in registration procedure were comparatively unimportant, and include the time, duration and hours of the registration period; the preparation, preservation and purging of permanent registration records; the registration of migrants and absentees; the extension of registration to or its exclusion from rural territory; the qualifications of registrants; and the compensation of registration officials. In New Jersey the registration period was changed from September to May and June; in Rhode Island from December to June; in Idaho and Missouri the registration period was slightly abridged and readjusted; and in Florida, the registration hours in the larger counties are more specifically prescribed.

For the purpose of relieving the voters of a civic duty which is somewhat reluctantly performed, there is a marked tendency to introduce the permanent registration system by virtue of which a voter who is once registered is not obliged to re-register unless he moves from the electoral district in which he is enrolled. A necessary auxiliary procedure to the permanent registration system is an inexpensive and certain method of purging the lists of voters who have moved, died or been disfranchised. Laws establishing the permanent registration system were enacted in Idaho and Delaware; provision was made for the preservation or progressive purging of the registration lists in Idaho, Wisconsin, Indiana and Connecticut.

The rapid growth of cities has led to a ceaseless migration of voters from one constituency to another and the diversification of industries keeps an appreciable per cent. of the electorate on pilgrimages in regions remote from the voting precinct. To afford these two elements of the electorate the opportunity to exercise the franchise, Idaho and Connecticut have provided a method for the registration of voters who move from one precinct to another between registration and election days; while Minnesota, New York, New Jersey, and Utah enacted laws enabling voters who are unavoidably absent on registration days to register by mail or by applying in person to some designated public official. As the purpose of registration is to prevent fraudulent voting, and as the voting of non-residents in rural and sparsely settled precincts is remote, there is a manifest tendency to restrict the enrollment of voters to cities and towns only, as is provided for (by somewhat different methods of approach) by laws enacted in Missouri, Wyoming, Massachusetts and Connecticut.

Since the introduction of woman suffrage, the qualifications of registrants, including the provision that the age may be given as "over 21 years," have been modified by Missouri, New York and Wisconsin. Two somewhat anomalous provisions were introduced into the laws of Oregon and Indiana. In Oregon, the secretary of state is authorized to submit the registration lists to the respective postmasters of the state to be checked and verified, and in Indiana a county registration board uses the primary poll books as a basis for the compilation of the lists of voters. Other unimportant provisions merely provide for an increase in the compensation of registration officials in Florida, Pennsylvania and North Dakota; the combination of urban and rural territory in registration precincts in Missouri; and changes in the registration applications in Connecticut.

Absent Voters.—The only changes made in the absent voter laws relate to the elections and classes of voters to which the laws are made to apply, and to an abridgement of the time within which applications for and distribution of ballots may be made. In Minnesota, absent voters were authorized to participate in special primary and special elections; and in Nevada and Vermont in municipal elections, to which Vermont also adds county elections. The classes of voters who may vote by absent voter ballot were extended to include voters who are actually absent, in New Hampshire and Vermont; to voters who are ill, in New Hampshire, South Dakota and Vermont; to voters who are physically disabled; in South Dakota and Vermont; to students in college and the wives of male citizens who accompany their husbands, in New York; and to railway employees and the members of the immediate families of commercial travelers and railway employees, in Oregon. The time within which ballots may be applied for and distributed was abridged in Illinois, Vermont and Wisconsin; and Minnesota permits notaries public to act as attesting witnesses in the execution of absent voter ballots.

Voting Machines.—By a law enacted in Maine, the use of ballot boxes with mechanical devices for receiving, registering and endorsing the ballots deposited therein is authorized. When voting machines are used in Iowa, the party row beneath the Democratic and Republican tickets must be left vacant. New York requires the appointment of custodians to put voting machines in order prior to each election.

Initiative.—In Nebraska, initiative measures, instead of being printed in pamphlet form, as heretofore, will be published in all of the newspapers of the state, and the secretary of state has authority to delegate that duty to the Nebraska Press Association. North Dakota prescribed the qualifications for signers of initiative petitions and prohibits fraudulent signing. In Wisconsin, a constitutional amendment providing for the initiative is pending.

Recall.—At the next election, Oregon will vote on a recall amendment to the constitution providing for the recall of all elected officials, but providing that the vacancies so created shall be filled by appointment.

Referendum.—Wisconsin prescribed the elections at which initiated city ordinances may be submitted to a vote; provided for the referendum in school districts having more than 500 voters, on any item, business or subject; and proposed a constitutional amendment providing for the referendum on all laws. In Massachusetts, in submitting questions to a referendum vote, the secretary of state decides whether or not a question of public policy is involved.

Corrupt Practices.—Texas provides that the amount of money which a candidate pays to have his name placed on the primary ballot is not included in the amount as limited by law for campaign expenses. Wisconsin requires all associations which advocate, endorse or oppose any party, faction, group, candidate, constitutional amendment or measure, before receiving contributions or making expenditures, to file its name, officers, and the nature and sources of its income and the purposes of the expenditures. In Massachusetts, the treasurers of political committees are required to make reports even if no money has been received or expended. Registrars of voters, members of town school committees and library directors are exempt from filing their expenses under the corrupt practices act of Connecticut.

Caucuses, Conventions and Nominations.—The Idaho law which authorized the payment by the state of the railroad fare of delegates to the party conventions was repealed. Kansas and Indiana provide for the filing of nomination papers by independent candidates. In Utah, a candidate who is nominated by a convention or committee, cannot have his name on any other party ballot. South Dakota and Montana provide for the election of women as well as men as national committeemen, and Indiana provided for women representatives on all committees. The number of signers on nominating petitions in Minnesota, Missouri, Wisconsin and Massachusetts was changed and prescribed. In Rhode Island, the city and town caucus law was extended to Woonsocket and North Providence; and in Pennsylvania the time for filing nominating petitions was changed. Georgia prohibits any person from attending a political mass meeting or convention unless he is duly registered and qualified; all conventions must be held at the county court house and ten days' notice thereof must be given.

General Elections. — With four rather significant exceptions, the changes effected in general election procedure affect the functioning only of agencies already in existence, but add nothing of consequence to the electoral facilities already provided for by law.

1. Laws enacted by Minnesota, Oregon, South Dakota and Wyoming provide that the names of the candidates for President and Vice-President shall be printed on the ballot along with the names of the presidential electors.

2. A constitutional amendment conferring full suffrage on women was adopted in Missouri by a vote of 175,580-152,713, and a similar amendment is pending in Rhode Island.

3. In Oregon an amendment to the Constitution was adopted by a vote of 184,031-48,645, which provides that persons who cannot read and write the English language cannot vote.

4. Utah provided for double election boards in districts having 200 or more voters; one set of officials acts as receiving judges and the other as counting judges; when a ballot box contains 20 ballots, it is delivered to the counting judges and the count is carried on while the ballots are being cast. Both sets of judges join in making the returns.

The laws making detailed changes in general election procedure provide for the method of marking, the printing and form of ballots, prescribed the number to be furnished to each precinct and for the destruction of the ballots after the election; requiring election officials to post the result of the election in the precinct as soon as the count is completed; providing where the report of the vote cast shall be filed; prescribing the method of canvassing the vote; increasing the compensation of election officials; providing that all persons who are within the polling places at closing time shall be permitted to vote; fixing the date of elections and designating the hours when the polls shall be kept open; adjusting the general election law to cities having home rule charters; providing for the division of cities into wards where wards have been abolished by home rule charters; prescribing changes in the form of election notices; poviding for the election of non-partisan candidates; devising a method by which a voter who moves from one town, city or ward to another prior to the election may retain his legal residence; providing for the furnishing, care and preservation of election supplies; authorizing voters who need assistance to select near relatives instead of election officials and affording assistance to voters who cannot read the English language; perfecting the laws concerning recounts and election contests; creating additional voting precincts; and providing for the appointment of additional election clerks in certain cities. The Wisconsin law providing for the provisional appointment of election officials with a hearing as to their qualifications was repealed.

Primaries.—The only extension of the primary during the year was to the judge of the superior court of Cook county, Illinois, and to Pender and Montgomery counties, North Carolina; and the only exemption was Randolph county, North Carolina. Existing laws were amended in detail concerning the withdrawal of candidates, the filing of application of candidacy and objections to certificates of nomination, the filling of vacancies occurring after the primary is held, the method of certifying non-partisan judiciary candidates, the method of canvassing the vote and arranging the names on the ballot and providing that the names of candidates may appear on only one party ticket. In Nebraska, no candidate is certified unless he receives at least 5 per cent. of the vote cast by his party. Parties which may use the primary in Nebraska are those which cast 5 per cent. instead of 1 per cent. as formerly of the total vote; and the ratio in Nevada was reduced from 10 per cent. to 5 per cent. In New Jersey, the date of the regular primary was changed from the 4th Tuesday in September to the 3d Tuesday in June, and in presidential years from the 4th Tuesday of April to the 3d Tuesday of May; and the date in Montana was changed from the 70th to the 91st day before election.

Oklahoma adopted a provision, affording a first, second and third choice of candidates at the primary. Arizona voted upon and California has proposed a measure providing that the person who receives 51 per cent. of the primary vote is the only name placed on the ballot. The Arizona measure was defeated by a vote of 13,166-34,360. In Georgia, candidates for the general assembly and judge of the superior court in counties of 200,000 must, in qualifying for the primary, designate the incumbent whom he wishes to succeed.

DIVISION IV
THE NATIONAL GOVERNMENT

CHANGES IN THE FEDERAL CONSTITUTION

By Arthur N. Holcombe
Professor at Harvard University

The Child Labor Amendment, proposed by the Congress, June 2, 1924, was not well received by the states, and before the end of January, 1925, it had been rejected by more than one-fourth of the states, while only three states had ratified it. One state, which ratified it, subsequently rescinded its ratification. Thus there was no prospect of any early regulation ratification of the amendment, and it was clear that it could never be ratified unless some of the rejecting states should reconsider and reverse their action. Nevertheless, the advocates of federal child labor refused to abandon the fight, asserting that they would continue their efforts until the proposed amendment should become part of the Constitution.

This rejection of this proposed twentieth amendment by more than one-fourth of the States raised a number of interesting questions. (1) Is the Department of State called upon to proclaim the defeat of an amendment in the same manner that it proclaims ratification of such a measure? (2) If such a proclamation were issued and if a sufficient number of States to change the result subsequently reversed themselves, what would happen? (3) If a State votes to ratify an amendment, then changes its mind and votes against it, which action is valid? (4) How long may the States be allowed to vote one way or the other, or both ways, on an amendment? The situation, resulting from the rejection of the child labor amendment by more than a fourth of the States, was unparalleled, and caused a growth of interest in proposals for the clarification and modification of the provisions of the Constitution relating to its own amendment.

Wadsworth-Garrett Proposal.—The only such proposal to be discussed on the floor of the Congress during the short session of the sixty-eighth Congress was the so-called Wadsworth-Garrett amendment. This amendment, originally introduced into the sixty-seventh Congress, proposes a substitute for Article V of the Constitution, under which the following changes would be made in the existing practice: (1) The members of at least one branch in each of the State legislatures which may ratify a proposed amendment to the Federal Constitution must have been elected after such amendment shall have been proposed. (2) Any State may require that ratification by its legislature be subject to confirmation by popular vote. (3) Until three-fourths of the States shall have ratified a proposed amendment, or more than one-fourth shall have rejected it, any State may change its vote. However, the Congress took no action on this proposed amendment prior to its adjournment on March 4.

Hill Proposal.—January 3, 1925, Representative Hill of Maryland introduced a bill, designed to clear up some of the doubtful points in the amending procedure, pending action on the proposed Wadsworth-Garrett amendment or some alternative measure. This bill would require the Secretary of State to certify when more than one-fourth of the States had rejected a proposed amendment to the Constitution, as he is now required to certify when three-fourths have ratified, and thus put an end to the uncertainty concerning the status of the pending child labor amendment. No action was taken by the Congress upon the bill. The authority of the Congress to limit the time within which the States might act upon a proposed amendment was discussed in the Senate, and the opinion was expressed that a "fair inference" from the Supreme Court opinion in the case of Dillon vs. Gloss (256 U. S., 368) would be that ratification must be "within some reasonable time after the proposal."

Unratified Amendments. — Meanwhile, it was pointed out, five proposed amendments to the Federal Constitution, including the child labor amendment, are still awaiting action by the states. Two date back to 1789. One was proposed in 1861 in the hope of averting the Civil War, and one was proposed in 1810. One of the earliest was actually ratified by Ohio as late as 1873, which was eighty-four years after its original proposal.

Norris Proposal.—Another proposal to amend the Federal Constitution, which was discussed both in the Senate and in the House during the short session of the sixty-eighth Congress, was the so-called Norris amendment to change the dates for the inauguration of the President and the convening of the Congress. This proposed amendment provides that a newly elected Congress shall meet on the first Monday in January, following its election; and that a newly elected president shall be inaugurated on the third Monday in January. Thus every Congress would meet in its first regular session two months after election instead of thirteen months later, as under the present practice. The new Congress would canvass the electoral votes for president, instead of the expiring Congress as under the present practice; and would choose the new President in case of no election by the Electoral College. The proposal to shorten the time between elections and entrance upon the duties of office and to do away with the present short session of the expiring Congress, following new Congressional elections, met with favor in both branches of the sixty-eighth Congress, but no definitive action was taken upon it.

Miscellaneous Proposals. — Seven fresh proposals for the amendment of the Federal Constitution were introduced into the last session of the sixty-eighth Congress in 1925, but none of them got beyond the committee stage in either House. One of these, which was recommended by Secretary of the Treasury Mellon, would give the Congress power to tax State and municipal bonds, which are now tax-exempt; and two others also related to taxation. Two related to the apportionment of Congressmen among the States, and two to Congressional or Presidential elections. The failure of the Congress to make any apportionment of Congressmen following the census of 1920, as required by the Constitution, doubtless stimulated interest in the section of the fundamental law relating to Congressional elections and apportionments.

THE PRESIDENT AND VICE-PRESIDENT

By James L. Sellers
Professor at the University of Wisconsin

PRESIDENT CALVIN COOLIDGE'S CHARACTERISTICS

During 1925 the United States has had the services of the President at his steadiest. The election of 1924 assured him that the overwhelming majority of the electorate had confidence in his integrity and approved of his conduct of the administration.

More than one year and seven months' service as president have enabled him to take soundings and assume command with a firm hand. The conclusion of a presidential term gave ample excuse for incompatible cabinet members to resign. The administration has become his own—as near to his wishes as the circumstances of practical politics will permit.

Upbringing. — President Coolidge descends from a line of Puritan ancestry dating back to the migration of John Coolidge to Watertown, Massachusetts, in 1630. His antecedents have thus absorbed the complete history of New England. American traditions and institutions are the outward expression of the lives of these people. Thus when Calvin Coolidge talks on American principles and institutions it is not only the President who speaks but it is the voice of the generations of New England. There the most virile principles of political liberty and religious freedom have expressed themselves in the social and political institutions which have been brought forth during three centuries. These have become the pride of the nation.

Calvin Coolidge was born at Plymouth, Vermont, July 4, 1872, the eldest son of John C. and Victoria Moor Coolidge. The story of his boyhood growth, education, and college days at Amherst need not detain us here. His college career was not conspicuous. However, he graduated with honors and the distinction of class orator in 1895, and at once took up the study of law in the office of Hammond and Field at Northampton, Massachusetts.

Coolidge's political career began at the age of twenty-seven as Councilman in Northampton. His advance was not rapid at first but showed a remarkable acceleration. In 1907 he was City Solicitor; Mayor, 1910-11; in the State Senate 1912-15; President of the Senate 1914-15; Lieutenant Governor 1916-18; and Governor of Massachusetts 1919 and 1920. His nomination as Vice-President in June, 1920, brought him to the Presidential chair August 3, 1923.

The rôle of President, invariably difficult, is doubly so when taken by one not elected to the position. The cabinet had been selected, the legislative program for the administration outlined and begun. The new incumbent was pledged to support his predecessor's program. Whereas the originator of a program would be comparatively free to vary his recommendations according to the dictates of experience, the inheritor of a program is bound to see it through or at least give no indication of his deviations.

Personality.—It is true that President Coolidge is not a figure conspicuously different from many of his fellows. He is of medium size, five feet ten and weighs one hundred and fifty pounds. A man of good figure and well-groomed appearance. His business dress and conduct are not particularly striking. He has no avocations which give subject matter for newspapers and barber shops. He has no taste for small talk. His countenance is pleasant but usually serious. He does not think aloud. When he talks he chooses a national subject. This may explain some of the comments of critics but it does not explain the President's remarkable popularity.

Popularity.—In the absence of the fashionable social graces and the mixing qualities of the politician, his popularity must rest on other grounds. The people may not know Coolidge intimately but they feel confident of his sincerity. He talks on economy, and Americans at heart still believe in individualism. Conditions in America and in the world at large are such as to point the President's appeals. His doctrines are intelligible to the common man. The carefully prepared speeches of the President have been given wide publicity by both radio and the press. Millions of people have heard his excellent radio voice, and feel that they know him. There is nothing in the personality or ideas of Mr. Coolidge which sets him apart from the majority of the people and prevents them from feeling that he is one of them.

Independence.—The election of 1924 gave President Coolidge a free hand.

It proved his astounding popularity despite his refusal to participate in a campaign. Here was a man who neither campaigned by public speaking, nor writing and was almost niggardly in granting interviews. He was not aloof but apparently indifferent to opponents' attacks and unconcerned about being known by the public. Perhaps it was tend-to-business attitude which inspired the confidence of the people at large, and polled him 15,500,000 votes in November, 1924.

Relations to the Public.—Despite his refusal to campaign, President Coolidge is a good mixer. He meets his fellows upon the level. He is not above swapping stories with the shoe-maker and taking his exercise walking the busy streets where he is an observing student of human nature. The President is particularly effective in speaking to business and professional men where his grasp of economic and constitutional principles is appreciated.

The President is also a good entertainer. The White House is the seat of a charming hospitable home where an attractive family enjoy life. Perhaps no occupants of the national mansion can be unconscious of the public attention which is bestowed upon them, but the seeming naturalness of the Coolidges has more than satisfied the public with their conduct.

The President does not take well to the red headline type of publicity. He meets the press correspondents, and they are privileged to ask questions in writing which the President answers as far as he thinks advisable. He, however, is unwilling to announce policies or discuss possible contingencies when no practical or vital question is involved. The President does not expect to be quoted directly. He seems to have succeeded in instilling some sense of responsibility into these correspondents.

The President, though a lawyer, has a journalist's judgment of publicity values. He chooses with strategic vision the occasion for public appearances. In his speeches throughout the country he has reached many sections and appeared before all elements of society. The farmers heard him at Chicago. He met the Scandinavians at Minneapolis and the World War veterans at Omaha. He spoke on naval policy at Annapolis and on patriotism and its meaning at Arlington and Cambridge. The Congregationalists were welcomed at Washington, and the business men entertained him at New York. His inaugural and budget addresses were intended for the nation at large.

Leadership.—This record of performance has done little credit to the title of "Silent Cal." In fact, few Presidents have worked more consistently and effectively to enlighten and lead the public along the course which he has charted. He has shown a tendency to conduct an orderly progress rather than to initiate rapid changes of policy. Despite the leisurely pace his speeches have shown positive elements which are worthy of study. We see the President fully and clearly revealed in his more important addresses.

In his inaugural March 4, 1925, he set forth his purposes, his program, and his ideal. These are founded upon certain fundamental traits of human nature which he regards as "the most constant thing in the universe." He holds that "the essentials of human relationships do not change. We must frequently take our bearing from these fixed stars of our political firmament if we expect to hold a true course."

Views on Foreign Policy.—The President emphasizes virile Americanism. He insists that "we have been and we propose to be more and more American." But he does not admit a merely selfish nationalism. For we not only serve our own country best by such a policy but we "most successfully discharge our obligations to humanity by continuing to be openly and candidly, intensely and scrupulously American."

Such a policy neither precludes our participation in world affairs nor eliminates us from membership in the World Court. The President, voicing what he regards as the determination of the American people, declares that we are determined not to become implicated in the political controversies of the Old World, "but America must continue to hold the lead in the new policy of limitation of armament." America stands for arbitration and the same principle should lead to our adherence to the Permanent Court of International Justice. He would have American influence "cast on the side of the reign not of force but of law, and trial not by battle but by reason."

The President seems to recognize that the rights of property and the economic rights of persons are inseparable. It is not property but the right to hold property which the constitution guarantees. Here the President makes no appeal to those without property, but rather trusts to the stimulation of private self-interest and initiative to promote the highest social well-being.

National and State Functions.—In his budget speech of June 22, 1925, the President made these significant remarks. "Unfortunately the Federal Government has strayed far afield from its legitimate business. . . . If we could confine our federal expenditure to the legitimate obligations and functions of the federal government a material reduction would be apparent. But far more important than this would be the effect upon the fabric of our constitutional form of government which tends to be gradually weakened and undermined by this encroachment. . . . The cure lies with the people. It will come when they realize the necessity of state assumption of state responsibilities."

The introduction of this constitutional viewpoint would seem to partake generously of the doctrines associated with Jefferson and Jackson. It is the very antithesis of the much emphasized doctrine of the Republican party during the first decade of the present century. The view seems to be well received, and the President is the spokesman of those who oppose the doctrine of national centralization which swept the country as by storm some twenty years ago.

National Defense.—President Coolidge spoke before the Naval Academy June 2. This was an opportune occasion to discuss policies of National defense. Here he reiterated and enlarged upon the principles announced in his inaugural address. He expressed the purpose to maintain such forces as comport with our dignity and security. He pointed out that the functions of the navy were to promote peace. It was in driving home this point that he said: "If we are to promote peace . . . we must call in the moral forces of mankind. The suggestion that any other people are harboring a hostile intent toward us is a very serious charge. We would not relish having our honorable motives and peaceful intentions questioned. Others cannot relish having any of us question theirs. We should not forget that the world over the general attributes and one of the strongest attributes of all peoples is a desire to do right."

Speaking before the American Legion October 6 he assured them that the United States had a larger army and navy than ever before in peace time. However, this is no point of pride with the President. He has on various occasions expressed the purpose to continue to promote the movement for further limitation of armament. This he considers an American policy and every opportunity should be utilized to promote it.

The obligations of citizenship is a subject to which the President has devoted much thought. He points out that Americanism does not depend upon place of birth, religious sect, language or racial stock. The privileges of liberty instead of being easy to enjoy are in reality, to him, highly difficult responsibilities. The responsibilities are due to the necessity of the citizen so conducting himself as to reduce the functions of government to a minimum. To the President the chief functions of government are to maintain order; provide security for persons and property, and set up the instrumentalities for the administration of justice. If the citizens can reduce the functions of government to this fundamental minimum, costs of administration will be small.

The problem of law enforcement has been particularly vexing during the past months. The Chief Executive would necessarily be compelled to formulate a policy. He stands for vigorous and firm enforcement. The thinking public concede that "laxity of administration reacts unfavorably upon public opinion," and since local administration has failed upon many of its attempted reforms (especially prohibition) nothing remains but to undertake it as a national movement.

The failure of local government, the President observes, has had a demoralizing effect in every direction. "What America needs is to hold its ancient and well-charted course. . . . A country conceived in the theory of local self-government . . . gives the largest promise to freedom and the development of the individual. . . . The passing of responsibility from local governments to the state and from the state to the nation . . . to pay their bills and tell them what to do is not self-government."

Political Philosophy.—If one were to summarize the President's political philosophy and constitutional tenets he would find them similar to those of the fathers of the constitution. He is a strong believer in liberty and the rights of the individual which leads him to restrain governmental action wherever possible. That same confidence in the individual leads him to prefer local to central governmental function for all problems of a local nature. He believes private initiative and enterprise the best guarantee of business integrity, efficiency and honesty. Thus to him government should be only regulatory and not productive.

Coöperation.—This survey of the President's speeches reveals a statesman who has digested the problems and theories of government. The administration of practical affairs requires application of these theories. This the President cannot do alone. He is dependent upon the support of Congress and the numerous administrative officials whom he employs and directs. He must obtain the coöperation of the legislature and his subordinates.

The coöperation of Congress is sometimes difficult to obtain. In dealing with it the President has shown both reserve and tact. He has exhibited no undue anxiety about his own recommendations becoming law. When the Sixty-eighth Congress was about to expire he took no hand in the selection of bills for the final rush of legislation. The President has not overlooked opportunities to elicit the good will and coöperation of Congress. In his inaugural he expressed his wish for coöperation and willingness to share credit for the conduct of the government with that body. It was with a view to facilitate working relations with Congress that the President chose Everett Sanders, Congressman from Indiana, to succeed Bascom Slemp as his private secretary.

VICE-PRESIDENT CHARLES GATES DAWES

A Unique Figure.—The nomination of Charles Gates Dawes for the Vice-Presidency brought a unique figure into American politics. He already had an international reputation: the Dawes Plan for German reparations established his name throughout Europe. In addition to his reputation, Dawes had the type of personality and style of address to furnish campaign headliners. He glories in action and enjoys a fight. It would have been difficult for the party to find a better field marshal to lead their campaign.

Dawes is a native of Marietta, Ohio, born August 27, 1875. He comes from the Puritan seed that was planted there in the first settlement of the Ohio Company, and numbers among his ancestors that astute politician, Manasseh Cutler, who was the active agent in securing the grant to the Company. His parents, General Rufus Dawes and Mary Gates Dawes, belong to its early families. Young Dawes attended two colleges. He received his bachelor's degree from

Marietta College, had a legal education at Cincinnati Law School, and practiced law at Lincoln, Nebraska, from 1887 to 1894. It was at Lincoln that he became acquainted with John Pershing, later commander of the American armies. In 1894 Dawes gave up his professional practice to take charge of certain business interests, and was especially successful as organizer and administrator. His father was a close friend of William McKinley, and the son won the Illinois delegation for McKinley who, as President, made him Comptroller of the Currency. He was defeated in a race for the senatorship from Illinois by Lorimer, and upon his return to business organized the Central Trust Company of Illinois, and became a large figure in the banking world.

The World War.—Occupied with business, Dawes took no active part in politics until the entrance of the United States in the World War, when he entered the army as a major of engineers, a branch of service in which he had some previous training. General Pershing soon discovered his presence in the A. E. F. and called him to his own staff. There he showed his usual initiative, and was made Chairman of the General Purchasing Board for the A. E. F. in France, and a member of the Allied Purchasing Board. He is credited with persuading Great Britain to create this unified administrative service for the allies.

The chance to testify before the congressional committee gave Dawes his opportunity. He was not in the least cowed by these solemn guardians of the public weal. He met the committee in fighting trim and in his replies put the committee rather than the witness upon the defensive. This testimony attracted national attention.

Director of Budget.—When the Federal Budget System was introduced in 1921 President Harding appointed General Dawes first director of the budget. After a year's service he resigned, and was appointed to the Reparations Commission to investigate Germany's ability to pay. The success of the plan recommended by this commission was probably the most important single factor in securing Dawes the nomination to the Vice-Presidency in June, 1924.

Just as in 1900, when Roosevelt did the major campaigning, Dawes took the stump in behalf of his ticket. He proved a very effective canvasser. He is a picturesque figure. He has an active personality whose every motion and position indicates vigor and determination. His speeches are strewn with crisp, snappy phrases with no uncertain meaning. He is the type of personality that "gets across."

Personality.—However, forcefulness is not the only or even chief characteristic of General Dawes' personality. He is a warm and intensely human and companionable man. He is devoted to his family. Young men are attracted by his frank, informal manner. He has the enthusiasm and zeal of the reformer seasoned by a long career in practical business. While his methods and manner appeal to youth his judgment and policies reflect much experience. He has all the qualities to make him a successful leader of a counter-reformation in politics. Since he considers himself a "progressive conservative," this is a fair description of his position.

As Vice-President, Dawes has given indication of the rôle which he expects to play. Soon after election, it became known that he did not desire to sit in the cabinet in a consultative capacity with no administrative responsibility. He has chosen rather to direct his attention to his constitutional duties as President of the Senate.

Senate Rules.—As President of the Senate he will be primarily occupied with applying the rules of that body. These he regards as over-weighted by accumulation of customs and traditions, in such a way as to render the body incapable of registering its own will. He accordingly proposed in his first appearance before the Senate that the rules be changed. The center of his attack was directed at rule No. 22 which permits any Senator to speak one hour upon a measure after the Senate has decided by vote that a vote upon the measure should be taken. Such a rule enables a single senator or a small minority to delay action and often defeat important measures which have the support of the majority.

The Vice-President points out that it is not his intention to deprive the minority of the right to be fully heard, but only to prevent the minority from obstructing the will of th majority. "Who," he asks, "woul dare maintain that in the last analysis the right of the Senate itself t act should ever be subordinate to th right of one Senator to make speech?" This, he holds, woul amount to bartering away the interest of the public, which it is th function of the Senate to promote.

UNOFFICIAL ADVISERS

By James L. Sellers

Professor at University of Wisconsin

Some presidents have brought their most intimate friends into the official cabinet. Others have attempted to command the services of the most popular men in their parties. Again, some have sought men of the most eminent administrative ability. Presidents sometimes rely upon their official cabinet for advice upon all subjects; while others have depended in part upon unofficial advice of outside friends, to help guide the affairs of state.

Personal Relations. — President Coolidge has not, except in the case of Sargent, chosen any intimate friend for a cabinet post. He has selected men of ability for official positions and relies chiefly upon their advice when questions of governmental policy are concerned. Nevertheless, there are times when even a President wants information of non-official character rather than advice; and prefers to get it from intimates rather than from official advisers.

President Coolidge has a small group of admirers to whom he assigns an important part in his political decisions. The first of these is Frank W. Stearns of Boston. He is first in point of intimate friendship, probably first in his devotion to and confidence in the President, and he has the greatest influence with the Chief Executive.

Stearns.—Mr. Stearns is a cotton mill owner and capitalist who was interested in Amherst College. He became acquainted with Coolidge when the latter was a member of the State Senate. They were strongly attracted to each other and Mr. Stearn has been most active since then i promoting Mr. Coolidge's political career. He is a slight little gray ma with a twinkle in his eye. He ha a way of getting things done in quiet manner. He never hesitate when a decision is to be made. H invariably retains his self-control. I appearance he is a very mild littl man, and yet he commands a stingin sarcasm which may be utilized whe the occasion demands. The President enjoys his contacts with Mr Stearns because they understand eac other completely.

Butler.—Senator William M. Butler, as National Chairman of th Coolidge campaign, is naturally high member of the Administratio Counsel. Mr. Butler is a native o New Bedford. He received his lega training at Boston University an then took up practice of law at Ne Bedford from 1884 to 1895. In 191 he moved to Boston and became member of the firm of Butler, Cox Murchie and Bacon. He entered th Massachusetts Legislature as membe from New Bedford in 1890 and continued in the Legislature until 1901 He was President of the Senat 1894-1895. From this position he obtained a control of Massachusetts Republican politics which has continue down to the present time.

Starting as the son of a poor minister Mr. Butler has become a ma of great fortune. He took an earl part in the development of municipa transportation in both New Bedford and Boston. He also has extensive interests in the cotton milling industry. In addition to these interests he has a lucrative law practice.

Mr. Butler has not been an active leader of the masses in politics. He is a sort of chief of staff, who commands the field from the distance and leaves the details to subordinates. He is not a personality to get into the thick of the fray. He has not the geniality and flexibility of the professional politician. Primarily he is a business man, and as such commands the confidence of that class of men. He is a protectionist. In a large measure he has been instrumental in getting the business interests of the country lined up back of the administration.

Others.—The other two men who are nearest to the President are Jim White who is the man directly in charge of the work of the Republican National Committee in Washington, and Ted Clark, the President's personal secretary. Jim White is a genial good fellow who often drops in and talks with the President. He has an abundance of information and news. Ted Clark was Secretary to the late Murray Crane. He also is no novice in the political game and on questions of Massachusetts politics he can supply detail that even Butler might want.

WILLIAM J. BRYAN

Bryan.—The deaths of Mr. Bryan and Mr. La Follette on July 26th and June 18th have removed two of the greatest personalities from American politics. From 1896 to 1912 Mr. Bryan was the undisputed leader of the Democratic party. After that period he remained a powerful influence in party councils, and a determining factor in party success. While the wisdom of some of the measures he advocated has been questioned, the honesty of his purpose to improve the condition of the masses of the people is undoubted.

Mr. Bryan was instrumental in the passage of some important legislation. While his doctrine of Free Silver is still the subject of ridicule it should be remembered that he led the South and West on that issue; he was a member of the administration which enacted the Federal Reserve Act providing for a more flexible currency. Whether national prohibition be good or bad Mr. Bryan must bear a large share of responsibility for its enactment. Bryan's outstanding quality was his oratorical power. Yet he was more than a man of words, he was a man of character.

ROBERT M. LA FOLLETTE

La Follette.—Between the careers of Mr. Bryan and Mr. La Follette many parallels and many contrasts may be drawn. Mr. La Follette was in many ways a man of stronger parts. He was a quicker and keener debater, a more ruthless and unsparing opponent. These qualities have their advantages in a legislative assembly but are probably not political assets with the nation at large. His record for constructive state leadership was without a parallel when he entered the Senate in 1900. The solidarity of that work is evinced by the stability of his home strength.

La Follette's relation to the Republican party was personally unfortunate but publicly most beneficial. He was the most progressive member of his party. He had worked out a set of reforms for his state, many of which might well be applied to the nation. He was the true and natural leader of this reform movement. Yet the old party refused to accept his leadership. By coöperation with the opposition he was able to impose part of his program upon a reluctant administration. His progressive movement, taken over by Roosevelt, gave the Democrats their chance and much of the Progressive program in modified form became law.

La Follette's great service to the Nation, in contrast to his service to his own State, has been in the rôle of leader of the opposition, a useful but not a popular position. As leader of a popular rights movement in opposition to the party machine he has reaped the reward of national unpopularity and defeat. In contrast to this, in his own state, he was the constructive leader. There he has earned and won the most complet political triumphs and the unshake devotion of his fellow citizens.

CABINET STATESMEN

By James L. Sellers
Professor at University of Wisconsin

STATE DEPARTMENT

During the past six years the position of the Secretary of State has been difficult. The unsettled condition of Europe has offered many perplexing problems of international relations. Though the United States was an active and leading participant in the World War, the election of 1920 was won on a platform of non-participation in European affairs. The Secretary of State must protect our vast interest, and at the same time keep up the proposed isolationist policy. For a time the isolation seemed so important that the Department of State refused to reply to communications from the League of Nations.

When the instructions of party platform and the condition of international relations seem to dictate such diverse policies it is difficult for the government to undertake an active foreign policy; hence the career of Secretary Hughes has been less conspicuous than was expected.

Charles Evans Hughes.—Charles Evans Hughes was born at Glens Falls, New York, April 17, 1862. He was educated at Colgate and Brown Universities and later studied law at Columbia. The greater part of his time and energy during the years 1884-1906 were devoted to the practice of law in New York City. He, however, gave some time to academic work. He was special lecturer at Cornell, 1893-95, and held a similar position in the New York Law School, 1893-1900.

During 1905 he acquired political prominence by his services as counsel for certain committees of the New York legislature. In this service Hughes completely won the confidence of the people of the State, and was elected Governor in 1906. Before second term was complete, he was ap pointed to the United States Suprem Court by President Taft. He resigne that position to participate in th campaign of 1916. His defeat for th Presidency gave opportunity to resume law practice in New York City During the succeeding four years h occupied a preëminent position at th head of the American bar.

His appointment as Secretary o State by President Harding in 192 gave an opportunity for unusual service. While the Administration wa loath to call the Washington Disarmament Conference so early in it career, the public seemed anxious fo action and Secretary Hughes took charge of the work. Here he was a his best. He had opportunity to plar the course of action, limit the subjec matter of the conference and generally to direct deliberations. Th United States remained deeply interested in the general question of peace much affected by commercial an financial interests. We would no willingly see the European situatio degenerate into anarchy, and yet th party in power is pledged to kee out of European politics.

In such a situation Secretary Hughes necessarily played a somewhat inactive rôle. Since conditions in Europe did not improve and the reparations problem seemed insoluble he suggested that an investigation to establish Germany's ability to pay would furnish a reasonable and practical answer to the problem. The Dawes Commission and its famous report came from this suggestion, and as a consequence Europe is on its way to economic recovery.

Secretary Hughes is a clear thinker and sees the results of any decision or course of action in terms of its future consequences. He has a capacity for putting his case in an irrefutable manner. His interest and experiences previous to entering the cabinet had dealt primarily with domestic rather than international problems. As an administrator he has shown unusual ability.

Frank Billings Kellogg, like Secretary Hughes, is a native of the Empire State. When only a boy of twelve years his parents moved, in 1865, to Minnesota. There he was admitted to the bar in 1875. After three years' experience as City Attorney of Rochester and five years as County Attorney of Olmstead County, he moved to St. Paul, where he established himself in his profession.

Mr. Kellogg entered into national politics in connection with service as special attorney for the United States in prosecution of the Paper and Standard Oil Trusts. He also investigated the Union Pacific and Southern Pacific merger. In 1916 he was elected to the Senate and after a defeat for reëlection was appointed Ambassador to England. His appointment as Secretary was a surprise to the public, because of his age, limited experience in the diplomatic service, and brief public career. He made a favorable impression upon President Harding during their joint service in the Senate.

The Secretary has aroused considerable hostility by his cancellation of the passport of Shapurgi Saklatvala, the Communistic member of the House of Commons. His invitation to the twelve interested powers to confer in Pekin on the question of extraterritoriality in China is the most significant action of the Department during the year, for it substantiates the belief that President Coolidge has a very geninue and kindly interest in the well-being of China, and that America is not going to sacrifice her interests for a policy of isolation.

DEPARTMENT OF THE TREASURY

Andrew W. Mellon.—The public generally is more directly interested in the Treasury than in any other department. The immense war debt to be refunded and paid, the terms of payment for loans to foreign countries to be fixed and the revision of our taxation system have all involved policies which will affect not only every American but will also affect directly many of the peoples of Europe. Naturally the people are tremendously interested in the person or persons who are responsible for deciding upon such far-reaching policies.

Secretary of the Treasury Andrew W. Mellon was born at Pittsburgh, Pennsylvania, March 24, 1854. His parents were Judge Thomas and Sarah Negley Mellon. Andrew attended the University of Pittsburgh, but very early engaged in business. He founded the town of Donora, Pennsylvania, and established the steel mills there. He is also interested in aluminum production, and served as director and president of Mellon's National Bank at Pittsburgh. This position he resigned to become Secretary of the Treasury March 1, 1921.

When President Harding looked about for a successful business man to undertake the administration of the government's business, he naturally turned to Mellon. He had shown remarkable talent for organization, was accustomed to handling business on a very large scale, and his judgment of business propositions was remarkably sound.

As a cabinet officer Mellon and Mellon's plans have been before the public almost constantly. He has stood for a policy of rigid economy, using arguments less philosophical than those of President Coolidge. He has assigned as reason for economy the need of improving the government's finances. In the first year of his administration he suggested dangers of panic and general business distress if rigid economy were not made the rule of action. For this reason he staunchly opposed soldiers' bonus bills and aid to states or any new items of expenditure.

The Secretary's business foresight and management have been applied to the public debt. The maturities have been either paid or refunded at such a rate as to produce a considerable saving. The annual reduction in the interest in a year was $16,730,000. The short-time debt (maturing within five years), is rapidly being transformed into long-time bonds at lower rates of interest.

His plan for tax reform, urged upon Congress a year ago, began with reduction of the rate of tax on the higher incomes. The Secretary insisted that the rate of taxation was destroying the government revenue and that business was handicapped. The surtax rates were considered almost confiscatory upon the very large incomes. Since large fortunes cannot engage in the ordinary productive pursuits which produce taxable incomes, investors are driven to tax exempt securities. This means the driving of capital from private to public enterprises. The Secretary figured that the revenue derived from taxation of large incomes was practically as great with the surtax rate at 13 per cent. as it was when the rate was increased to 65 per cent.

The opposition at once attacked his proposition as a piece of class legislation to benefit the wealthy at the expense of the poorer citizens, and the Secretary's plan of revision of the income tax was drastically revised by the last Congress.

The Secretary, in December, 1925, was making an appeal for revision, on the ground that the income tax law must be regarded as a failure. Unless it is so revised as to demonstrate its efficacy, to raise revenue without disturbing business it will have to be given up. He is not willing to condemn it as a principle of taxation and is only afraid that the present pernicious rates will condemn it in the eyes of the business world and cause its abandonment as a source of revenue.

The Secretary is interested in a repeal of the federal inheritance tax law, as competing with state inheritance tax laws in almost every state, as difficult and expensive to administer and as placing excessive burdens on many who are ill prepared to bear them. Its operation has proved so inequitable that people the countr over are employing experts to recas their wills in order to escape th tax. The Secretary has made a urgent appeal to repeal this law an to leave the inheritance tax for th states to use as a source of revenue.

Secretary Mellon has been the mos persistent advocate of a constitutiona amendment authorizing the federa government to tax the incomes fro interest upon state and municipa bonds. This, he urges, would driv $13,000,000,000 of capital from hiding and make the wealth of the country bear its share of taxes. While th Secretary has had the very active an emphatic support of the Presiden upon his proposals for revision of th taxing laws, the President has bee silent upon this amendment, whic involves a constitutional differenc between the President and his Secretary. President Coolidge has expressed his desire to revitalize stat and local governments, and coul hardly consent to a blow to depriv them of this exemption.

The Treasury Department is responsible for the rather unpopular dut of enforcing the prohibition amendment and Volstead Act. The Secretary turned over the direction of thi work to one Assistant Secretar General Lincoln C. Andrews. To facilitate the work, treaties extendin the three-mile limit were made wit several foreign powers.

Secretary Mellon has been a ver influential member of the President' counsel, in part because of the importance of his department and i part due to personality and ability On questions of finance the Secretar is very well grounded both in practic and theory.

The Secretaryship is Secretar Mellon's first experience in publi life. He does not talk like a politician. His strength with the publi has been based mainly upon his candid expression of opinion. He i clearly a cautious and conservativ administrator who applies conscientiously the theories he holds. Whil he has not attained the indifferenc to criticism which frequently appear in public officials he seems to enjo the opportunity of public service. Although many would disagree with him as to point of view, it must be admitted that his attitude toward his responsibility is most commendatory.

WAR DEPARTMENT

John W. Weeks.—The Department of War has undergone changes of leadership during the year in both its civil and military branches. John W. Weeks, appointed by Harding, March 4, 1921, became ill in April of this year. His duties then devolved upon Assistant Secretary Dwight Filley Davis who soon succeeded him. General John J. Pershing retired on September 13 as Chief of Staff and was succeeded by Major General John L. Hines. These changes do not presage any change in policy, for the new leaders have helped develop the policies of their predecessors.

Secretary Weeks was born at Lancaster, New Hampshire, April 11, 1860. His youth was spent upon a farm, which he left to take up his training in the Naval Academy at Annapolis and was graduated in 1881. He spent two years in active naval service as a midshipman. He then entered business and in 1888 became a member of the banking firm of Hornblower and Weeks in Boston. In his residence city of Newton he took an active part in community life. In 1900 he was elected Alderman and in 1903, Mayor. He served as Chairman of the State Republican Convention in 1905. He was a member of the 59th and 62nd Congresses, and was Senator from Massachusetts from 1913 to 1919.

Secretary Weeks administered the War Department during the difficult period of post-war retrenchment, with good judgment and administrative tact. He is a man of unusual industry, moderation, and common sense.

Dwight Filley Davis is a native of St. Louis, born July 5, 1879, the son of John Tillman and Maria Filley Davis. At the age of twenty-one he was graduated A.B. from Harvard, and three years later LL.B. from Washington University. He very soon assumed large business responsibilities, and was active on numerous civic boards, commissions and committees. He was a director of the War Finance Corporation, and in 1923 was made Assistant Secretary of War.

Department Policies.—The policy of post-bellum national defense as outlined in the National Defense Act of 1920, limited the Regular Army personnel to 17,000 officers and 280,000 enlisted men. It was intended to serve as first defense in case of war, garrison the important posts and furnish an instructional staff for training civilian components of the nation's defensive organizations. After later reductions the total on active service, June 30, 1925, was 12,462 commissioned officers and 121,762 enlisted men.

Both Secretaries made persistent efforts to keep up the National Guard, increase the Officers' Reserve Corps, and encourage the citizens' Military Training Camps.

The War Department is confronted with a difficult problem of housing. It has inherited the temporary structures built during the war, and is still using many of them as barracks and hospitals. These buildings are not well planned for permanent quarters and still less for hospitalization. The Department most earnestly urges that these temporary barracks be replaced with suitable hospitals.

Secretary Weeks opposed a separate department for the air service. He would not consolidate the air service for the army and the navy. However, he advised that the field of operation of the two services should be fixed by law. He suggested that the army maintain an aerial force twice as great as that of the navy. Aviation may have before it considerable future development. This will make the problem of its permanent relation to the other branches of the service uncertain for some time to come. However, for the present the policy of the department is to make it an auxiliary part of the service.

John Joseph Pershing.—The retirement of General Pershing has taken from the government service one of its most prominent characters. General Pershing has in many ways played the rôle of the ideal citizen. He has served his country well in high places, and still has made no effort to exact political leadership for his military service.

He has an active intellect, sound judgment and well disciplined habits of thought. He is self-reliant and reserved in his habits of conversation—not the man to form close friendships. The General was not good "political timber" and it is to his credit that he recognized this limitation and continued in his own specialty.

DEPARTMENT OF JUSTICE

Harlan F. Stone.—No department has caused recent Presidents so great concern as the Department of Justice. The Department had become the focus of attack and President Coolidge was especially concerned to find the right man to fill it. In the appointment of Harlan F. Stone as successor to Attorney General Daugherty, there could be no question about his legal qualification for the position. For years Dean of Columbia Law School, a member of the New York law firm of Sullivan and Cromwell, his ability and experience were great, yet after nine months as Attorney General he was appointed to the Supreme Court to succeed Justice McKenna. This opportunity was probably by his own choosing, although some press comments were made on a supposed lack of political judgment.

John G. Sargent.—The nomination of Charles Warren as successor to Mr. Stone having failed of confirmation after many prophecies as to the President's next move, the name of John G. Sargent of Vermont was sent into the Senate and confirmed without opposition. The nomination was a distinct surprise to the country for Sargent was a man without a national reputation.

The new Attorney General brings a different element into the cabinet; he is the country town lawyer, little associated with big business. His qualifications rest upon his knowledge of law and his command of the confidence of the President. He is intimate with the Coolidge family.

Sargent has had a sound educational background. After attending the public elementary schools he entered Black River Academy at his own town of Ludlow, Vermont, where the President also had his preparatory schooling. Sargent then entered Tufts College and was graduated A.B. He entered the law office of William Stickney at Ludlow in 1887 and after three years was admitted to the bar. Without being a prominent politician, he knows Vermont politics. He served as Attorney General of Vermont, 1907-1909. "Jumbo" Sargent, as he was known on the Tufts football team, is the largest man in prominent public position. He is a Vermonter who knows how to get the most out of living. He has discovered the good trout streams and enjoys the out-of-doors. In the outskirts of his quiet town he developed a big brick country home, which holds an extensive library.

NAVY DEPARTMENT

Curtis Dwight Wilbur.—The Navy Department is just now in a unique position because of the experiment in limitation of armament which applies only to that branch of the service. The Secretary must share in carrying out the agreement in good faith, and also satisfy the American public that home interests are adequately protected.

The present Secretary is the first of President Coolidge's original Cabinet appointments. He was born at Boonesboro, Iowa, May 10, 1867. He received his early education in the public schools of Boonesboro and of Jamestown, North Dakota. In 1888 he was graduated from the Naval Academy at Annapolis and resigned from the navy at once. After a year of teaching school he entered a law office and began the practice of law at Los Angeles in 1890. From 1899 to 1903 he served as chief deputy to the District Attorney of Los Angeles County. For the next fifteen years he was a state judge. In 1919 he became Associate Justice of the California Supreme Court, and three years later was made its chief justice.

From this position he was taken by President Coolidge to be head of the Navy Department.

Secretary Wilbur's experience has been rather in the field of justice than of administration. However, he comes from a family whose members have demonstrated their talents in various administrative positions.

For many years the Navy can hardly be said to follow an enunciated policy. The new Secretary has tried to formulate such a statement. After advice by the general Naval Board, he accepted and announced a policy, its general purpose and the methods and means by which he proposes to attain those ends.

The selection of Secretary Wilbur has been variously explained. Doubtless his attractive personality aided. Like the President, he is an active Congregationalist. A stronger influence is probably the geographical one; he represents the significant part which the Pacific is to play in our future naval policy. Then too he has lived near the storm center of the naval oil lease controversy without being in any way implicated in it. As a lawyer and judge he should be a very useful adviser to the President in dealing with that and other problems. Politics had something to do with it. Wilbur is a recognized opponent of Senator Hiram Johnson in California.

Policies.—As a fundamental naval principal it was decided that the "Navy of the United States should be maintained in sufficient strength to support its policies and its commerce, and to guard its continental and overseas possessions." In view of the term of treaty resulting from the Washington Conference it was decided "to create, maintain and operate a navy second to none and in conformity with the ratios for capital ships established by the treaty for limitation of naval armaments."

In elaboration of these large purposes several principles were announced: (1) To make the capital ships' ratios the basis for building efforts in all classes of fighting ships. (2) To direct the principal air effort on that part of the air service which is to operate from ships of the fleet. (3) To assemble the active fleet at least once a year for a period of not less than three months. (4) To maintain an active personnel afloat, in conformity to the ratios established for capital ships in the treaty on limitation of armament. (5) To maintain the marine corps personnel at a strength sufficient for current requirements. (6) To develop American interests, especially the American merchant marine. (7) To create, organize and train a naval reserve force. (8) To make the Naval Reserve secure in status and organization. (9) To cultivate close association between active and reserve officers. (10) To give the public all information compatible with military secrecy. (11) To have always in mind that a system of outlying naval and commercial bases suitably distributed, developed, and defended, is one of the most important elements of national strength. It is hoped that the aggressive leadership of the Secretary will tend to clarify the situation.

POST OFFICE DEPARTMENT

Harry Stewart New, as Postmaster-General, is one of the late appointees of President Harding, entering service March 5, 1923, and continuing in President Coolidge's cabinet. He is one of the older cabinet members, who has had a long political career.

Harry Stewart New was born at Indianapolis, December 31, 1858, and educated in the public schools of that city. He began his career as a reporter for the Indianapolis *Journal*. From this position he was advanced to editor and later became publisher. He had unusual business capacities and founded the Bedford Stone and Construction Company, of which he is still President.

It is almost impossible for an Indiana editor to keep out of politics. New was a member of the Indiana State Senate from 1896 to 1900, and of the United States Senate from 1917 to 1923. He served upon the Republican National Committee from 1900 to 1912. As an editor-senator he had much in common with President

Harding. This with the claim of Indiana for a place in the cabinet perhaps accounted for his appointment.

Policies.—In quantity of business and services rendered to the people of the country the Post Office Department is the largest of the federal departments. It is an old department with many traditions well established. The period since the war has been one of economic readjustment, raising many questions of policy for the Post Office Department. Decisions may have great political consequences for the administration, in questions involving the pay of more than 200,000 postal employees. The President vetoed a bill providing increased pay, upon the ground that it made no provision for increasing postal revenue to take care of the additional outlay; the Secretary concurred. The question of what the scale for postal employees should be was thoroughly discussed. The Secretary took the ground it should approximate that of department stores employees, rather than the wages of skilled workmen or earnings of the professional classes.

The new bill resulted in the Act of February 28, 1925, which not only increased the wages and rates but also directs the Postmaster-General to continue to investigate the costs of the various services and to report his findings annually. The Department is satisfied with the present scale of wages, except the lack of increase for night work.

Air Mail.—The air mail postal service is of very recent development, and has great possibilities of expansion. Experiments in air mail began in May, 1918; it is only since July 1, 1924, that there has been a continuous through day-and-night service from New York to San Francisco. The eastern journey is timed to 29 hours and 15 minutes. The west bound schedule calls for the transit of 2,665 miles in 34 hours and 20 minutes because of prevailing westerly winds.

Since the installation of the day-and-night service the Department has created three zones and fixed the rates of letter postage in these zones at eight cents for the first zone, sixteen cents for the second and twenty-four cents for the entire route. This through service involved large additional expenditure for regular and emergency landing fields, for beacon lights to guide the pilots and flood-lights for landing in fields. The Department has set signal lights in 1,900 miles of the crossing, and now has ninety-six air mail planes, sixty-three of which are equipped for night service.

Since July 1, 1925, the Department has established a special night service air mail between New York and Chicago. Planes leave Hadley Field, New York, at 9: 30 P. M., and reach Chicago at 5: 45 A. M. Chicago planes leave Maywood Field at 7: 30 P. M., and arrive in New York at 5: 00 A. M. The Postmaster-General believes that the service has justified itself by the results obtained.

Mail Frauds.—Another policy of the department which is less spectacular but of inestimable importance to the public is the attempt to prevent the use of the mails for fraudulent purposes. By coöperation with the Department of Justice the postal officials have succeeded in destroying some of the largest graft organizations that the country has ever known. The "fraud orders" are a wonderful check on fraudulent organizations. The department has specialized upon oil "crooks" and "quack doctors."

Administration. — Postmaster-General New has recommended that the President be relieved of a large part of the appointive responsibility in his department. He suggests that the law should place the appointment of third class postmasters, of which there are over 11,000, in the hands of the Postmaster-General.

In the economic policy of the department, the question of owning or renting housing accommodations is of prime importance. While it has been the policy of the government to own its own buildings, the appropriations for building and purchase have not kept up with the needs of the service, and the large outlay for rents is increasing.

The Postmaster-General has grasped

the problems of his department and is taking active measures to solve them. His pleasant personality and long business experience are of great value in his present work.

INTERIOR DEPARTMENT

Significance.—The Department of the Interior has come to be one of the centers of domestic affairs. Established in 1809, it included from time to time a variety of specialized services, many of which have gradually been transformed into new departments. It still retains the Land Office, Indian Office, Pension Office, Bureau of Education, Bureau of Reclamation, National Park Service and Alaskan Railroad. From it, within the past year, the President transferred by executive order the Patent Office, Geological Survey and Bureau of Mines, all to the Department of Commerce.

The responsibility for administration of such vast government funds and properties, along with the necessity of developing policies of disposal and future management makes the position of Secretary important. The Harding Administration was unfortunate in its prime selection for this important post. Hubert Work was called to take over the position when it had reached the nadir of unpopularity under Secretary Fall.

Secretary Hubert Work was born at Marion Center, Pennsylvania, July 3, 1860. He received his collegiate and professional education at Pennsylvania State Normal School, the University of Michigan and the University of Pennsylvania, which granted him the M. D. He began medical practice at once (1885) at Greeley, Colorado. In 1896 he moved to Pueblo and founded Woodcroft Hospital. He has been an active member of the Republican party organization. He served as First Assistant Postmaster-General, 1921-1922; and as Postmaster-General the following year. He was transferred to the Department of Interior in 1923.

Bureau of Reclamation.—It is in the Bureau of Reclamation that the greatest problems have recently appeared for the department as is elsewhere described in this volume. Some twenty years ago a number of vast reclamation projects were undertaken; the expenditure to be returned was out of the income from the sale of lands. The revenue from this source has been particularly disappointing. The Secretary explains that the small return is due chiefly to two causes:

(1) Much of the land reclaimed has not been taken up by settlers; (2) Many of the settlers are unable to make payments.

The failure of actual settlers to meet their payments can be explained on many grounds. The practice in the past has been to give blanket relief to those who urgently insisted upon it. The new policy of the department is to require each individual to make separate application and to treat each upon its merits. The abandonment of unprofitable projects will entail a considerable loss, but no alternative appears which will avert the loss. Secretary Work must face these problems. He regards the reclamation work as beyond the power of the states, because many of the projects involve two or several states. Public or private agencies might be employed to promote settlement of the reclaimed areas by the states. The Federal Government would be glad to be relieved of the reclamation construction, but no state is willing to take over this responsibility. The Secretary has held up a number of authorized developments until there is further evidence of their desirability.

Indian Service.—In the Indian service the Department has also followed a policy of decentralization. All the tribal Indians are now becoming citizens of the states, which have, or should have agencies and facilities for performing all the services hitherto undertaken by agents of the Federal Government. For instance, the Secretary would make the states completely responsible for Indian education, but with financial assistance from the Federal Treasury.

Alaska Railroad.—The Department has charge of the government-owned Alaska Railroad, which is a losing enterprise. Critics have suggested that it should be salvaged and a motor road maintained in its stead. The Secretary is aware that Alaskan business must be small for some time to come. A motor road would also be costly to maintain, and would give a less satisfactory service. He regards the railroad as a necessity which will give the services required, at as small a cost as they can be obtained.

DEPARTMENT OF COMMERCE

Growth.—The Department of Commerce has expanded more rapidly within the past year than any other of the Federal departments, partly through redistribution and reorganization of executive functions. Several important services, including the Patent Office, Geological Survey and the Bureau of Mines, have been transferred from the Department of the Interior to the Department of Commerce.

Likewise the former services have been extended. The Bureau of Foreign and Domestic Commerce has greatly increased its functions and the Bureau of Standards has been very active.

Secretary Hoover stands in the front rank of the men in public service today. No other administrator under the President has so much of the confidence of the public. His character, intellect, achievements, speeches, and public conduct combine to establish that faith in him.

Secretary Herbert Clark Hoover was born at West Branch, Iowa, August 10, 1874. His parents were Jesse C. and Hulda Minthorn Hoover. Among his forbears are Huguenots as well as Dutch immigrants. His immediate parents were Quakers. His father, a blacksmith, died when he was six, and he was brought up by his mother, a woman of active intellect and spiritual devotion. When Herbert was 10 years of age she also died, and he was cared for by Quaker relatives, among them an uncle who was an Indian agent. At the age of sixteen, having reached the Pacific Coast, he began to provide for himself. At Salem, Oregon, a successful miner aroused his interest in science and led to his later study of geology.

Professional Standing.—He was in the first class of the new Leland Stanford Junior University. Before and after graduation he was employed by mining interests to survey and examine mine prospects in the mountain states and Mexico. He also was employed as a mining expert in Western Australia, and in China, South Africa and Russia.

World War Service.—Hoover's part in the World War is well known to people the world over. As a result of his great service he received honorary degrees from twenty-six universities and colleges. When President Harding offered him the Secretaryship of Commerce, there was a clear understanding that he was to have opportunities to reorganize the work and reform many of the practices of the Department. It was understood that the conduct of his Department would be free from political influence.

Policies.—Secretary Hoover brought to his Department and the government at large a new vision of the government's opportunities. He believed in transforming the department into an agency of worthwhile practical services, such as exceed their cost in actual business balances. He has an eye for large scale economies and distribution advantages, and is ingenious in devising means to accomplish his purpose. A very important step was the reorganization of the Bureau of Foreign and Domestic Commerce. As it had been previously operated to collect commercial information, it was more valuable as a historical record than as an agency for business. The information to be of value to business men had to be supplied more promptly.

Secretary Hoover has tried to gather information that will forecast business demands. He has utilized experts in special lines to supply the information and he makes such information available to American business men, in time to enable them to adjust their business to market conditions in every part of the world. As a result the number of demands for services from the Department of Commerce by exporters, merchants, bankers, etc., have increased tenfold since 1921.

Interest in Production.—The Secretary is interested in improving domestic production, as the factor which will determine our ability to compete with other producers. Through the Patent Office it can effectively influence production by protecting inventors and fostering inventions and through the Bureau of Standardization wastes in production may be eliminated. Within this Bureau Secretary Hoover has organized a Division of Simplified Practice, to reduce the diversity in styles and patterns of a given manufactured commodity. For example, the number of kinds of milk bottles was simplified from 49 to 9.

To get industries to adopt these simplified practices of production and abandon their old more complicated and diversified practice has been a real problem. The Bureau of Standards has called numerous conferences of producers and industrial managers, in which the advantages of simplified practice in production are set forth. The great economies of marketing are clearly evident.

Hoover is fully aware that commerce is influenced by a great diversity of factors, and realizes that it is his duty, not merely to tabulate the statistical growth of business transactions, but to produce sound business prosperity and to improve the standard of living for the whole nation. As an economic expert without a peer, he is called upon to offer opinions and solutions for many and sundry national ills.

Labor.—He has been prominent in the Labor Conferences held during the past five years. He sees the labor problem as no mere adjustment of hours and wages but a problem of stimulating an interest in creative production. The worker must find stimulus and joy in his work beyond the mere purpose of drawing his pay. The managers and employers must establish a relation that gives confidence and a continuing bond of interest to the worker if they have any expectation of stabilizing labor relations.

Transportation.—Another factor in commerce is transportation. The railroads must still be regarded as our chief agency, but subject to a variety of improvements. Patrons of the roads should systematically plan to distribute their shipping so as to avoid congestion. We need further consolidation of railroad management, to secure additional economies. There is crying need for consolidation of freight terminals. The railroad rates are in need of readjustment, and railroad finances will have to be strengthened.

Theory of Government.—After observing these achievements and recommendations one is naturally interested in his theory of government. How far would he utilize government for purposes of production and control of economic functions? He holds that the failure of the Russian revolution is due to the attempt to substitute altruism and patriotism and eliminate the stimulus of self interest. He regards bureaucracy as deadening to human initiative and destructive of social and economic progress.

Growth of Reputation.—What explains Hoover's overshadowing reputation and his phenomenal success as a public servant? Presumably his clear and complete understanding of all the details in every situation. He has a remarkable ingenuity for devising means to reach any of his clearly conceived objectives. He possesses unbounded faith in the good sense and intentions of his fellow men. For this reason he invariably favors voluntary rather than regulatory methods.

Another factor which has made him superb as a national adviser, especially upon economic topics, is his status as a scientist, a statistician, and an engineer. He has an appetite for statistics and curves which aids him to sense a movement or a trend in its inception. He acts upon facts. He acts with assurance. Such is what the "engineer - economist - organizer" can do in a government position.

DEPARTMENT OF AGRICULTURE

Vacancy.—The death of Secretary Wallace left a vacancy at the head of the Agricultural Department, November 4, 1924. The position was temporarily filled by Assistant Secretary Howard N. Gore, Governor-elect of West Virginia, but he continued to serve the Department until inauguration day.

William M. Jardine.—In the meantime President Coolidge announced as his successor William M. Jardine of Kansas, the youngest member of the cabinet. He was born in Oneida County, Idaho, January 16, 1879. He spent his early years on ranches in Idaho and Montana. He was graduated from the Agricultural College of Utah where he specialized in Agronomy. He continued in academic work in Utah and later in the Kansas Agricultural College. He served as dean of the latter institution from 1913 to 1918; and since that time has been its President.

Qualifications.—Secretary Jardine's experience has brought him in contact with the most acute agricultural problems of the country. Researches in dry farming gave him intimate knowledge of the conditions and difficulties on the agricultural frontier. He is no mere theorist on the question of agricultural expansion and he understands the methods that must be employed if it is to be carried on successfully. Coming from a state that has suffered most severely from agricultural depression, he knows what are the needs of the farmers in the grain belt.

It would have been difficult to find a man better qualified for the position of Secretary of Agriculture. Jardine combines scientific knowledge, administrative experience and ability, political contacts and the confidence of a depressed section.

Policies.—The general policies of the Department as expressed in speeches of the President and the Secretary's utterances are about as follows:

(1) The general agricultural depression from which we are just recovering is the chief problem. Additional measures for alleviation of the depression and for prevention of future fluctuations are to be employed. National legislation will be needed to attain some of these results.

(2) The Secretary regards freight rates upon agricultural products as one of the causes of depression. He points out that freight rates reached a maximum at the time that agricultural products were bringing their minimum price. He proposes that rates on agricultural products should bear some relation to their market value.

(3) The coöperative marketing societies are to be encouraged because they may be utilized as agents for stabilizing agricultural conditions. It is not the purpose of the Department to sponsor or manage or even closely regulate these societies but to offer them protection and the benefit of tried advice. The responsibilities which these societies assume, require their members to master an amount of economic knowledge which will stabilize production, and in turn will steady agricultural prices and conditions.

(4) The Department is especially active in collecting and disseminating information. By a system of crop reporting the department has attempted to forecast the size of the various crops to be planted in sufficient time before seeding to enable farmers to change their acreage. This service is being extended to live stock breeding. It thus enables farmers to follow the reports and adjust their production in view of the prospective supply at the time of marketing. Hence the Department has arranged to have the colleges broadcast its weather, crop and marketing reports.

(5) The Department is also interested in scientific agriculture. Recent legislation has increased the money available for use of experiment stations. The findings of investigators are published in the Agricultural bulletins, and should do much to reduce costs of agricultural production.

(6) Since agricultural prosperity depends chiefly upon market conditions it is the policy of the department to coöperate closely with the Department of Commerce. The efforts of these able secretaries should do much to stabilize production.

DEPARTMENT OF LABOR

Secretary James John Davis.—If government is to assist in solving our industrial problems the Department of Labor must be assigned stupendous responsibilities. The nation is becoming more and more industrial in character as each year brings its crises in industrial relations. The public is an interested party and expects its interests to be guarded by the government. It looks to the Secretary of Labor for suggestion, especially in labor and immigration problems.

The present Secretary of Labor is the only cabinet member born outside of the United States. He also has the experience of rising to that important position with very little formal education. He is a member of a labor union and at the same time has built up a considerable fortune. James John Davis was born at Tredegar, Wales, October 27, 1873. His family migrated to Sharon, Pennsylvania, in 1881 where his father found employment as a puddler in the iron works. The family had few worldly goods and any extra earnings by the children were a welcome addition to the family income.

Trade.—Davis was a likely lad who made acquaintances easily. He drove the hotel keeper's cows to pasture, ran errands for numerous neighbors and business acquaintances, carried telegrams and shined shoes. At eighteen he began regular work as a puddler in the iron works. In 1883 he moved to Elwood, Indiana, and began work in the tin plate mill. He was a member of the Amalgamated Association of Steel and Tin Workers of America, and served as Secretary of his local order.

Public Service.—At twenty-five he was elected City Clerk of Elwood and four years later was chosen County Recorder of Madison County. His first experience in political leadership came in a controversy over a strike in 1896. Davis saw the danger of the strike to the workers and voiced his doubts in such a manner as to defeat the strike agitators. In his first political campaign he carried a large slate and demonstrated before his audiences his ability in mathematics and orthography. He was thus especially successful in refuting charges of illiteracy and allaying suspicion aroused by his foreign birth.

As recorder, Mr. Davis saved money, and began to assist various friends in all kinds of small ventures. He now turned his full attention to this type of business and founded the American Bond and Mortgage Company of Pittsburgh.

Mooseheart.—In 1906 he became a member of the Loyal Order of Moose, an organization including large numbers of working men. Davis had long felt the need for better protecting the widows and orphans of workers. He felt that this was just the organization to assume that function. He was made Director General of the Order and came to realize that the way to keep the Order interested was to require from it a service to humanity. Hence he persuaded his colleagues to join in founding a home for the dependent children of deceased members of the Order. This, in many cases, has included also the widows, so as not to separate the families. To this end was established Mooseheart—"The School that Trains for Life"—near Chicago. The success of this dream of the Director General has made it possible to put into practice a new system of education; besides the usual academic high school training for such of the students as show the necessary capacity, every boy and girl gets a training in some kind of skilled trade or pursuit in which graduates can make their own living. Davis has been specially concerned in thus building up a practical education for both boys and girls such as might be introduced into any city that is willing to make the necessary appropriations.

Labor.—His success in public life is due first of all to his inheritance of a strong, physical constitution developed by rigorous labor. All his life he has shown an unusual capacity for work: this makes possible a very active life and the habit of investigating things at first hand, delegating as little as possible to subordinates. His mind seizes the essentials and he has developed a high power in public speaking.

As Secretary of Labor, Davis was at first by some people considered an enemy of organized labor. On that question his platform appears to be that he believes every man should have the right to work; that in some situations Labor Organizations have earned the right to control conditions and terms of contract, that most labor troubles can be and ought to be avoided. He has made it his principle to prevent strikes rather than to settle them.

Immigration.—As a part of his duties the Secretary of Labor is in charge of Immigration. Secretary Davis had urged a system of examinations of the immigrants abroad which would enable us to select a better quality of immigrants. He proposes that deficiencies in national quotas in any year be carried forward to increase the quota of that country in future years, depending on economic conditions and subject to the secretary's official recommendation. The statistical work of the department has been much improved under his administration and has gone far toward establishing a science of labor statistics which will aid in settling future industrial problems.

THE FEDERAL ADMINISTRATION

(Principal Officers Classified)

By Arthur N. Holcombe
Professor at Harvard University

THE PRESIDENT AND VICE-PRESIDENT

President.—Calvin Coolidge, of Massachusetts (Republican). Sworn into office as President of the United States, August 3, 1923, in succession to the late President Harding. Reelected to the presidency, November 4, 1924. Inaugurated for his first elective term, March 4, 1925.

Vice-President. — Charles Gates Dawes, of Illinois (Republican), was inaugurated Vice-President of the United States on March 4, 1925.

Secretary to the President.—Everett Sanders of Indiana, succeeded C. Bascom Slemp, resigned, as secretary to the President on March 4, 1924. Mr. Sanders was formerly a representative in Congress from the Fifth Indiana District.

Vacancy.—By Act of Congress, in the case of vacancy in office of President through the death or removal of both President and Vice-President, the Cabinet officers succeed to the presidency in the order indicated in the following summary of the executive departments.

CABINET CHANGES

Several changes in the Cabinet occurred during the year. The most important, politically speaking, was in the Department of Justice. Jan. 5, Harlan F. Stone resigned in order to accept an appointment to the Supreme Court in place of Justice McKenna, who had retired. The President nominated Charles B. Warren of Michigan, former Ambassador to Japan and to Mexico and chairman of the resolutions committee in the last Republican National Convention, to be Justice Stone's successor. Foreseeing strong opposition to this appointment from the then existing Senate, the nomination was not pressed until the special session of the new Senate, which convened March 4. Confirmation was opposed largely on account of Mr. Warren's alleged connections with the "beet-sugar trust." On March 10 the nomination failed of confirmation, by a tie vote, 40 to 40, Vice-President Dawes being absent; and then after reconsideration was defeated 39 to 41. President Coolidge resubmitted

Mr. Warren's name, but the appointment was finally rejected, March 16, by a decisive majority; and the President thereupon nominated an old Vermont friend, John Garibaldi Sargent. This appointment was promptly confirmed.

March 4, Frank B. Kellogg, formerly Ambassador to Great Britain and Senator from Minnesota, succeeded Charles E. Hughes as Secretary of State; and William M. Jardine, formerly President of the Kansas State Agricultural College, became Secretary of Agriculture in succession to Howard M. Gore, Governor-elect of West Virginia, who had been acting-Secretary since the death of Secretary Wallace. October 13, Dwight F. Davis of St. Louis, Assistant-Secretary of War, and acting Secretary during the illness of Secretary Weeks, was promoted to the Secretaryship on the latter's resignation.

DEPARTMENT OF STATE

Secretary of State.—Frank Billings Kellogg.

Undersecretary of State.—Joseph C. Grew.

Assistant Secretaries of State.—Leland Harrison. — J. Butler Wright.—Wilbur J. Carr.—Robert E. Olds.

Foreign Service Personnel Board.—Joseph C. Grew, Undersecretary of State.—Butler Wright, Assistant Secretary of State.—Wilbur J. Carr, Assistant Secretary of State.—Hugh R. Wilson, Chairman of the Executive Committee.—Ralph J. Totten, member of the Executive Committee.—William Dawson, member of the Executive Committee.

Solicitor.—Green H. Hackworth.

Economic Adviser. — Arthur N. Young.

National Museum: Assistant Secretary in Charge.—Alexander Wetmore.

National Gallery of Art: Director.—William H. Holmes.

Bureau of American Ethnology: Chief.—J. Walter Fewkes.

International Exchanges: Assistant Secretary in Charge.—C. G. Abbott.

National Zoölogical Park: Superintendent.—William M. Mann.

Astrophysical Observatory: Director.—C. G. Abbott.

Regional Bureau for the United States International Catalog of Scientific Literatures—

Assistant in Charge.—Leonard C. Gunnell.

National Academy of Sciences.—President.—A. A. Nichelson. Vice-President.—T. C. Merriam. Foreign Secretary.—R. A. Millikan. Home Secretary.—David White. Treasurer.—G. K. Burgess. Assistant Secretary.—Paul Brockett.

National Research Council:—Chairman.—Gano Dunn.

Pan American Union: Director General.—L. S. Rowe.

General Accounting Office:—Comptroller General of the United States.—J. R. McCarl.

Interstate Commerce Commission—

Commissioners: Clyde B. Aitchison, Charles C. McChord, Balthasar H. Meyer, Henry C. Hall, Joseph B. Eastman, John J. Esch, Johnson B. Campbell, Ernest I. Lewis, Frederick I. Cox, Frank McManamy, Thos. L. Woodlock.

United States Railroad Labor Board—

Public Group.—Ben W. Hooper, chairman; G. Wallace W. Hanger, vice chairman: Edwin P. Morrow.

Labor Group.—E. F. Grable, A. O. Wharton, W. L. McMenimen.

Management Group.—Horace Baker, J. H. Elliott, Samuel Higgins.

Civil Service Commission.—Commissioners: President, William D. Deming; George R. Wales, Jessie Dell.

United States Bureau of Efficiency.—Chief: Herbert D. Brown.

Federal Reserve Board—

Chairman.—Andrew W. Mellon, Secretary of the Treasury (*ex officio*). John W. McIntosh, Comptroller of the Currency (*ex officio*).

Governor.—D. R. Crissinger.

Vice-Governors. — Edmund Platt, Adolph C. Miller, Charles S. Hamlin, Edward H. Cunningham, George R. James.

Federal Trade Commission.—Commissioners: Vernon W. Van Fleet, John F. Nugent, Charles W. Hunt, Huston Thompson, William E. Humphrey.

The United States Shipping Board.—Members: T. V. O'Connor, E. C. Plummer, Meyer Lissner, W. S. Benson, B. E. Haney, W. S. Hill.

United States Shipping Board Emergency Fleet Corporation.—President, Elmer E. Crowley.

United States Railroad Administration.—Director General, James C. Davis.

Board of Tax Appeals.—Chairman, J. Gilmer Korner, Jr.

War Finance Corporation.—
Chairman.—Andrew W. Mellon, Secretary of the Treasury.
Managing Director.—Eugene Meyer.
Directors.—George R. Cooksey, Fred Starek, Floyd R. Harrison.

Alien Property Custodian.—Alien Property Custodian, Howard B. Sutherland.

United States Tariff Commission.—
Chairman.—Thomas O. Marvin.
Vice Chairman.—Alfred P. Dennis.
Commissioners.—Edward P. Costigan, Henry H. Glassie, A. H. Baldwin, Edgar B. Brossard.

United States Employees' Compensation Commission. — Chairman, Mrs. Bessie Parker Brueggeman; Harry Bassett, Charles H. Verrill.

United States Veterans' Bureau.—Director, Frank T. Hines.

Federal Board for Vocational Education. — Director, J. C. Wright.

Federal Power Commission.—
Commissioners.—Dwight F. Davis, Hubert Work, William M. Jardine.
Executive Secretary.—O. C. Merrill.

The Commission of Fine Arts.—Chairman, Charles Moore.

World War Foreign Debt Commission.—Chairman, Andrew W. Mellon; Frank H. Kellogg, Herbert Hoover, Reed Smoot, Theodore E. Burton, Charles R. Crisp, Richard Olney, Edward H. Hurley.

Personnel Classification Board. — Chairman, F. J. Bailey; Guy Moffett, W. H. McReynolds.

PERSONNEL OF THE JUDICIARY

By Arthur N. Holcombe

Professor at Harvard University

SUPREME COURT OF THE UNITED STATES

William Howard Taft (Ohio), Chief Justice, appointed 1921.

Oliver Wendell Holmes (Massachusetts), appointed 1902.

Willis Van Devanter (Wyoming), appointed 1910.

James Clark McReynolds (Tennessee), appointed 1914.

Louis Dembitz Brandeis (Massachusetts), appointed 1916.

George Sutherland (Utah), appointed 1922.

Pierce Butler (Minnesota), appointed 1922.

Edward Terry Sanford (Tennessee), appointed 1923.

Harlan F. Stone (New York), appointed 1925.

Officers of the Supreme Court

Clerk.—William R. Stansbury.

Deputy Clerks. — Philander R. Stansbury; C. Elmore Cropley.

Marshal.—Frank Key Green.

Reporter.—Ernest Knaebel.

CIRCUIT COURTS OF APPEALS OF THE UNITED STATES

First Circuit.—Mr. Justice Holmes; George Hutchins Bingham (New Hampshire); Charles F. Johnson (Maine); George W. Anderson (Massachusetts).

Second Circuit.—Mr. Justice Stone; Henry Wade Rogers (Connecticut); Charles M. Hough (New York); Martin T. Manton (New York); Learned Hand (New York).

Lodge, George D. Horning, Jr., Thomas L. Jones, Neil Burkenshaw, Rebekah S. Greathouse, E. Russell Kelly, Albert A. Stern.

Special Assistants.—Capt. Harold W. Orcutt, A. Coulter Wells.

CONGRESS

By Arthur N. Holcombe
Professor at Harvard University

The sixty-ninth Congress, which convened for its first regular session on December 7, showed numerous changes in personnel as compared with its predecessor. There were 14 new members in the Senate, and 78 in the House. Most of the changes were produced by the 1924 elections; but death had ended the careers of several of the leaders. Senator Robert M. La Follette, of Wisconsin, independent presidential candidate in 1924, died June 18; and his party associate, Senator Edwin F. Ladd of North Dakota, died four days later. Senators Medill McCormick of Illinois, Selden P. Spencer of Missouri, and Samuel M. Ralston of Indiana, the latter one of the few men who ever refused the presidential nomination of a major party, were the other Senators to be removed by death. Six members of the House of Representatives also died before the regular session began. Robert M. La Follette, Jr., was elected to succeed his father in the Senate, and another of the deceased members of the House was also succeeded by his son. Two of the deceased Congressmen, Kahn of California and Rogers of Massachusetts, were succeeded by their widows. One other woman, Miss Mary T. Norton of New Jersey, was elected to the House. Among the prominent members of the sixty-eighth Congress, who were retired by the voters at the polls, were Senator Magnus Johnson of Minnesota, Farmer-Laborite; Senator Thomas Sterling of South Dakota; Senator A. O. Stanley of Kentucky; and Senator David I. Walsh of Massachusetts. Representative Everett Sanders of Indiana resigned his seat in order to become Secretary to the President, succeeding Mr. C. Bascom Slemp, who retired from that position on March 4.

The sixty-eighth Congress, which adjourned sine die on March 4, was in session during 215 actual days. During that time 12,474 bills were introduced, and 898 resolutions. Of these a total of 996 were adopted; including 632 public laws, one of which was passed over a presidential veto, 75 public resolutions, and 289 private laws and resolutions.

Organization and Committees.—The organization of the new House itself had been determined at Republican and Democratic caucuses of the members-elect, which were held in the preceding February; and the selection of Representative Nicholas Longworth of Ohio to be Speaker, of Tilson of Connecticut to be majority floor-leader, and of Garrett of Tennessee to be minority floor-leader, were promptly confirmed at the opening of the regular session in December. In the House of Representatives twelve Republican members who had followed the leadership of Senator La Follette in the presidential campaign of 1924 were deprived of their previous committee-assignments, in so far as they were desirable, and relegated to the bottom of unimportant committees. In the Senate, on the other hand, an effort was made by the Republican leaders to adjust their differences with the surviving followers of the Wisconsin insurgent-leader, including his son, Robert M. La Follette, Jr., who had succeeded to his father's seat.

PERSONNEL OF CONGRESS

By Milton Conover
Professor at Yale University

Political Complexion.—Politically the Senate of the Sixty-eighth Congress was composed of fifty-two Republicans, fifty-two Democrats, and two Farmer-Laborites. The House of Representatives contained 223 Republicans, 208 Democrats, an Independent, a Socialist, a Farmer-Laborite, and a vacancy. The Senate of the Sixty-ninth Congress contained fifty-five Republicans, forty Democrats, and one Farmer-Laborite. The House of Representatives was composed of 247 Republicans, 183 Democrats, three Farmer-Laborites and two Socialists.

Previous Service.—The parliamentary and administrative experience of the Sixty-eighth Congress may be inferred from the fact that twenty-four Senators had served in the House of Representatives, nineteen had been governors of states, and five had served both as representatives in Congress and as governors. All but twenty of them had served as Senators in at least one preceding Congress. The experience of the Senate of the next succeeding Congress was about the same, although the Senate had twelve new members. The House of Representatives of the Sixty-eighth Congress contained 311 members who had served in preceding Congresses; while the Sixty-ninth Congress contained 353 experienced members, many of whom had served in State legislatures as well as in preceding Congresses.

Speaker.—Immediately upon the assembling of the Sixty-ninth Congress, Nicholas Longworth of Ohio, who had served ten terms in Congress, was elected Speaker of the House, in accordance with a caucus of Republican members elect held in March, 1925. Among the leading committees elected by the House were these: on Accounts, Appropriations, Enrolled Bills, Interstate and Foreign Commerce, Mileage, Rules, and Ways and Means. In five cases the same chairman was elected in the Sixty-eighth Congress. In the other two as the chairmen had retired from Congress, the senior ranking members were chosen. This seniority of committee service, however, was not necessarily identified with seniority of service in the House, for most of the chairmen of these most important committees were filled by men who had served from four to seven terms only; yet there were many representatives of the majority party who had served more than seven terms in the House, and several who had served more than eleven terms.

Sectionalism.—Political sectionalism was apparently a factor in the election to committee chairmanships. For instance, Pennsylvania, strongly Republican, and consequently not having been especially catered to in presidential nominating conventions in recent decades, was represented in 1925 in the chairmanships of thirteen important congressional committees, including the committees on Foreign Affairs, Printing, Naval Affairs, Post Offices and Post Roads, Banking and Currency, the Steering committee and the Committee on Personnel of the House Service. Six other committee chairmanships were granted to the New York delegation, four to the Indiana, four to the Illinois—the vice-president's state—and two to Ohio—the speaker's state.

Apportionment.—Closely akin to this matter of committee assignment was the problem of congressional apportionment. The preference of these two congresses was to maintain its present membership of 435 representatives. The ratio of representatives to population is still the same as that which was based on the census of 1910, viz., one representative for every 211,877 inhabitants, and States like Vermont which had suffered a loss in population were deprived of one of their representatives whose seats were allotted to other states whose population had increased sufficiently to warrant increased representation in Congress under the new ratio. This practice did not insure increase in representation for the less populous sections beyond the Mississippi River. The question of geographical and economic factors in Congressional apportionment could not be averted. It was even suggested that the long distances from Washington of constituents and the consequent local inaccessibility of congressmen should be taken into account. Under the apportionment based on the 1920 census, New York City is allotted twenty-three representatives in Congress, while only twelve representatives are allotted to all of the population located in the "Mountain Time Belt" stretching from Canada to Mexico. Again, defining the natural metropolitan area of New York City so as to include all of the congressional districts that economically compose the metropolis, including seven of the Northern New Jersey districts, it is observed that this congested area lying within a radius of fifty miles of the Grand Central Depot, has thirty-one representatives or more than the entire representation of the twelve states lying between Puget Sound and Minnesota, and between California and Texas. Congestion of population in other cities than New York has resulted in larger urban representation in Congress. For instance, Chicago has nine congressmen, Philadelphia and Greater Boston each have seven, and Los Angeles has two. This factor, however, is tempered somewhat in that each of the sparsely populated states has just as many senators in Congress as have the over-populous states. Nevada with only 77,407 inhabitants, has three men in the two houses, and New York State, with a population of 10,385,227, has forty-five. In the Senate Nevada has as much voice in special and concentrated powers as another State with 134 times the population.

CONGRESSIONAL RULES

By Milton Conover

Professor at Yale University

Appropriations.—Four decades of comparative research and of public agitation looking towards improved methods of legislative procedure apparently was justified in some measure by the accomplishments in parliamentary law since the publication of the 1919 Year Book. After 1919, one of the first rules proposed to reestablish in the Appropriation Committee, virtually all of the major appropriation functions of the House of Representatives. By an amendment to the rules adopted on June 1, 1920, the Appropriation Committee was given jurisdiction over all of the principal appropriations including major portions of that formerly exercised by the Committees on Foreign Affairs, Military Affairs, Post Office and Post Roads and on Indian affairs. The Rule stipulated, likewise, that "no bill or joint resolution carrying appropriations shall be reported by any Committee not having jurisdiction to report appropriations, nor shall an amendment proposing an appropriation be in order during the consideration of a bill or joint resolution reported by a committee not having that jurisdiction." The provisions were preliminaries to the enactment of the Budget and Accounting Act of 1921.

General.—Both the Sixty-eighth and Sixty-ninth Congresses made significant changes in the Rules of Procedure, particularly the House. The major changes pertained to the powers and duties of the committees; election contests; the "Consent Calendar," and the "Discharge Rule." Modification of the latter constituted the principal change in the Rules for the Sixty-ninth Congress.

World War Veterans.—A new House Committee on World War Veterans' Legislation was created, January 18, 1924 (Rule 11, 51 c.), to consider all matters pertaining to "War-Risk insurance of soldiers, sailors, and marines, and other persons in the military and naval service of the United States or growing out of the World War, the United States Veterans' Bureau, the compensations and allowances of such persons and their beneficiaries, and all legislation affecting them other than civil service, public lands, adjusted compensation, pensions, and private claims." Despite these last exceptions, it was clear that the business of this Committee would be voluminous.

Contested election cases were brought under a new provision on January 18, 1924, when Rule XI was amended by Section 726A which stipulated that the "several election committees of the House shall make final report to the House in all contested election cases not later than six months from the first day of the first session of the Congress to which the contestee is elected except in a contest from the Territory of Alaska in which case the time shall not exceed nine months."

Speeding Reports.—The Committee on Rules in 1924 was subjected to further restraint through the addition of Section 725A to Rule XI, providing that "The Committee on Rules shall present to the House, reports concerning rules, joint rules and order of business within three legislative days of the time when ordered reported by the Committee. If such rule or order is not considered immediately it shall be referred to the Calendar and if not called up by the member making the report within nine days thereafter, any member designated by the Committee may call it up for consideration."

The Consent Calendar was brought under momentous regulation in 1924 and in 1925 through amendments to Rule XIII, a rule which had been adopted on March 15, 1909. These modifications required that three members, rather than one, must object to the consideration of a bill to prevent its being called from the Consent Calendar. Thus, the power of a single member to obstruct legislation for personal retaliation or intimidation, was lessened, in this instance. As finally amended, the rule provides that "After a bill which has been favorably reported shall be upon either the House or the Union Calendar any Member may file with the Clerk a notice that he desires such a bill placed upon a special calendar to be known as the 'Consent Calendar.' On the first Monday of each month immediately after the approval of the journal, and on the third Monday of each month immediately after the disposition of motions to instruct Committees which may be called up, the Speaker shall direct the Clerk to call the bills which have been for three days upon the 'Consent Calendar.' Should objection be made to the consideration of any bill so called, it shall immediately be stricken from such calendar, that such bill may be restored to the calendar at the instance of the member, and if again objected to by three or more members, it shall be immediately stricken from such calendar, and shall not thereafter be placed thereon: *Provided*, That the same bill shall not be called twice on the same legislative day."

"The Discharge Rule."—Governing the motion to discharge committees from the consideration of a public bill or resolution in its possession and permitting the bills being called up for discussion—was a subject of lively debate in former Congresses, especially in the Sixty-eighth and Sixty-ninth Congresses. It was discussed for six days in the former congress and its final modification by the Sixty-ninth Congress constituted the only major change in the House Rules during 1925. First adopted on June 17, 1910, the Discharge Rule was amended on February 3, 1912. Later, on January 18, 1924, it was amended with the object of permitting a minority of the membership to prevent a bill's being buried in committee—one of the older and prevalent practices of both the national and the state legislatures, excepting Massachusetts—a practice with sufficient far-reaching relationships as early as 1887 and 1912 to draw out the attacks of Woodrow Wilson in his *Congressional Government* and in his *The New Freedom.*

The discharge rule of 1924 provided that "A member may present to the Clerk a motion in writing to discharge a committee from the consideration of a public bill or resolution which has been referred to it thirty days prior thereto (but only one motion may be presented for each bill or resolution). The motion shall be placed in the custody of the Clerk, who shall arrange some convenient place for the signature of Members. A signature may be withdrawn by a Member in writing at any time before the motion is entered on the Journal. When members to the total number of one hundred and fifty shall have signed the motion it shall be entered on the Journal, printed with the signatures thereto in the Congressional Record, and referred to the Calendar of Motions to Discharge Committees."

Discharge Rule of December, 1925.—This clause, however, was altered on December 7, 1925, so as to permit a member to present a motion "to instruct a committee to report within fifteen days a public bill or resolution" rather than "to discharge a committee from consideration" of such instruments as was stipulated in the 1924 rule.

Furthermore the 1925 amendment required that motions calling bills from committees should be signed by 218 representatives rather than by just 150 when the House should be all present. This insured majority control of committee action in the House, and the Rule specified that "When a majority of the membership of the House shall have signed the motion it shall be entered on the journal, printed with the signatures thereto in the Congressional Record, and referred to the Calendar of Motions to Instruct Committees,"—rather than "referred to the Calendar of Motions to Discharge Committees" as in 1924.

Recognition on the floor of the House is reassured the signers of these motions by the 1925 Rule in the provisions that "On the third Monday of each month, immediately after the approval of the Journal, any Member who has signed a motion to instruct which has been on the Calendar at least seven days prior thereto, and seeks recognition, shall be recognized for the purpose of calling up the motion, and the House shall proceed to its consideration in the manner herein provided without intervening motion except one motion to adjourn. Recognition for the motions shall be in the order in which they have been entered."

Majority control of the procedure in operating these motions is guaranteed by the 1925 rules which states that "When the motion shall be called up, the bill or resolution shall be read by title only prior to a second being ordered by tellers. After the reading of the bill by title, the motion shall not be submitted to the House unless seconded by a majority of the membership of the House to be determined by tellers and clause 4 of Rule XV shall not apply to such second; if such motion fails of a second, it shall immediately be stricken from the Calendar and shall not thereafter be placed thereon."

Debates on these motions are regulated by the 1925 rule, by the requirement that "If a second be ordered, debate on such motion shall be limited to 40 minutes, one-half thereof in favor of the proposition and one-half in opposition thereto. Such motions shall require for their adoption an affirmative vote of a majority of the membership of the House. Whenever such motion shall prevail the committee shall report said bill or resolution to the House within 15 days thereafter and said bill or resolution shall be referred to its appropriate Calendar."

This significant amendment was adopted on December 7, 1925, by a vote of 208 to 196, thirty members not voting. Robust opposition was offered to the alteration, mostly on the part of the Democrats. Reasons for the adoption of the rules as stated on the floor of the House by Chairman Snell, were that, "The proposed rules strike out the discharge rule that was adopted at the beginning of the Sixty-eighth Congress. Every Member who was a Member of the House at that time knows that that was a compromise rule. It suited no one and never would have been adopted if either side had had a clear majority. It actually accomplished nothing. The only thing it did was to waste the time of the House and to throw the House into chaos and confusion such as we have never seen before since I have been a Member of the House of Representatives."

Tilson of Connecticut, floor leader, thought it absurd that a minority consisting of five votes more than one-third of the House, as is provided in the rule of the Sixty-eighth Congress should be able at any time to take from a committee of this House and from the responsible majority of the House the control of a bill and force the House to take action upon it.

Another argument was expressed

by Congressman Barkley of Kentucky thus: "No such rule as that has ever been dreamed of prior to this time. Before you can get any action on this rule you have to have three affirmative votes of a majority of all of the members elected."

Minor Changes.—Early in 1926, it was apparent that these changes would have to undergo severe tests before the end of the first session of the Sixty-ninth Congress. Other than this change in the Discharge Rule, there were practically no major changes in the House rules, excepting those that were adopted for the adaptation of the new amendments to the Discharge or Instruction rule; and a few rules altering the number of memberships in certain committees, e.g., those on Ways and Means, Judiciary, on Interstate and Foreign Commerce.

Senate.—With regard to the Senate Rules, it had been generally anticipated that efforts would be made to limit the time which individual senators might speak in debate, and that other modifications would be made. But as late as January 4, 1926, apparently nothing had been accomplished, except the delivery of an address in the Senate by Senator Pat Harrison of Mississippi, in opposition to the extra parliamentary efforts that had been made during the preceding recess. In early January, 1926, however, there were indications that attention would be given to this matter later on in the Session.

THE SUPREME COURT AND CONSTITUTIONAL LAW

By Howard Lee McBain
Ruggles Professor of Constitutional Law, Columbia University

AMENDMENTS TO THE JUDICIAL CODE

February 13, 1925, extremely important amendments to the Judicial Code were enacted by Congress. They affected the jurisdiction of the Supreme Court as well as of the lower United States courts. The technical parts of the act need not be reviewed here. Suffice it to say that direct review by the Supreme Court of cases decided in the territorial courts and the courts of the insular possessions was abolished, except for review by certiorari of certain important cases from the Philippine Islands. Direct review by the Supreme Court of judgments of United States District Courts, skipping the Circuit Courts of Appeals, was limited to certain suits under the antitrust and interstate commerce acts; to certain instances in criminal cases where the decision of the District Court is adverse to the United States; to permanent injunctions suspending the enforcement of state statutes issued by a court with three judges sitting; to judgments in certain suits to enforce, suspend, or set aside orders of the Interstate Commerce Commission; and in certain cases which arise under the livestock act of 1921.

Review by the Supreme Court of cases decided by the circuit courts of appeals can be obtained only by certification from such court asking for instructions, or by certiorari issued by the Supreme Court, or, where decision is against the validity of a state law, on writ of error or appeal. Review from the Court of Claims is only by similar certification or by certiorari. Appeal in habeas corpus proceedings is from the District Courts to the Circuit Courts of Appeals instead of as formerly in certain cases direct to the Supreme Court. The general tendency of the act will be to decrease the number of cases coming before the highest court of the land.

PERSONAL RIGHTS AS AGAINST THE UNITED STATES

A brief review follows of the more important questions of constitutional law that have been decided by the Supreme Court since the beginning of the October term 1924. The volume and page references are to the

Lawyers' Edition of the Supreme Court decisions.

Jury Trial in Contempt.—At the time of the enactment of the Clayton Act in 1914 there was a good deal of discussion of the constitutionality of the provision which authorized the accused to demand a jury trial in any case involving disobedience to a writ or decree of a United States court, provided the act done was of such a character as to constitute also a criminal offense either under federal or state law. Ten years elapsed before this question of constitutionality was finally settled. (Michaelson v. United States *ex rel.* Chicago etc. Ry. Co., 69 L. ed., 14.) Certain striking employees of the railroad were enjoined from combining and conspiring to interfere with interstate commerce by picketing and using force and violence.

Thereafter proceedings in contempt were instituted. The employees demanded trial by jury. This the district court denied "on the ground that the power of a court to vindicate or enforce its decree in equity is inherent; is derived from the Constitution as a part of its judicial power; and that Congress is without constitutional authority to deprive the parties in an equity court of the right of trial by the chancellor." The Supreme Court reversed this judgment and sustained the statute. The Court argued that the statute was of narrow scope, not interfering with the power to deal summarily with contempts committed in the presence of the court, and not reaching those cases of refusal to do something which a decree commands which may be enforced by coercive means or remedied by purely compensatory relief.

A criminal contempt and a criminal case are fundamentally the same. "The proceeding is not between the parties to the original suit, but between the public and the defendant." In a criminal case the accused has a constitutional right of trial by jury. "The statutory extension of this constitutional right to a class of contempts which are properly described as 'criminal offenses' does not" violate the constitution in any way. Whether from the viewpoint of the history of punishment for criminal contempts or from the viewpoint of common sense it is difficult to see how the Supreme Court could have reached any other conclusion.

Later in the term the Court decided another important point in the constitutional law of contempts. In an elaborate and learned opinion it was held that the President's pardoning power extends to convictions of criminal contempt. (*Ex parte* Grossman, 69 L. ed. 377.) "The language of the Constitution cannot be safely interpreted except by reference to the common law and to British institutions." The "background of the common law and English history before the American Revolution . . . show that criminal contempts were within the understood scope of the pardoning power of the Executive."

The records of the constitutional convention show that the clause "offenses against the United States" was presumably inserted to make clear that the President's pardoning power was not to operate upon offenses against the states. An offense against a federal court is an offense against the United States. "Moreover, criminal contempts of a Federal court have been pardoned for eighty-five years." Nor is there anything to the argument that this will destroy the independence of the judiciary and violate the principle of the separation of powers.

As for the wisdom and usefulness of the pardoning power as applied to criminal contempts, the Court, with fine restraint, asks: "May it not be fairly said that in order to avoid possible mistake, undue prejudice, or needless severity, the chance of pardon should exist at least as much in favor of a person convicted by a judge without a jury as in favor of one convicted in a jury trial?"

Undue Prejudice.—That "undue prejudice" and "needless severity" may be shown in contempt proceedings was strikingly illustrated in another case decided only a month later. (Cooke v. United States, 69 L. ed., 526.) The petitioner, an attorney, wrote a contemptuous letter to a United States district judge accusing him of prejudice and of listening to slander against the attorney's client. This contempt was not committed in open court. The court ordered the prisoner arrested, and "refused him time to secure and consult counsel, prepare his defense, and call witnesses, and this although the court itself had taken time to call in counsel as a friend of the court," and had the district attorney present "on the ground that it was a criminal case." In pronouncing sentence the court even made new charges which the contemners had been given no opportunity to hear, "much less to meet or explain."

The Supreme Court held that such procedure was not due process of law. In such a case the proper practice was to issue a rule to show cause. "Without any ground shown for supposing that a rule would not have brought in the contemners, it was harsh under the circumstances to order the arrest," and "the procedure pursued was unfair and oppressive." Moreover in cases of this kind wherever it is practicable the judge who is personally attacked should ask one of his fellow judges to take his place.

Burden of Proof.—A Congressional statute of 1909 made the mere possession of opium after 1913 "sufficient evidence to authorize conviction" for smuggling "unless the defendant shall explain the possession to the satisfaction of the jury." The burden of proof against the presumption of guilt was thus placed on the accused. Was this due process? "Yes," answered the Supreme Court. (Yee Hem v. United States, 69 L. ed. 540.) 'That a legislative presumption of one fact from evidence of another may not constitute a denial of due process of law, or a denial of the equal protection of the law, it is only ssential that there shall be some raional connection between the fact proved and the ultimate fact preumed, and that the inference of one act from proof of another shall not be so unreasonable as to be a purely rbitrary mandate." It is a logical nference that opium found in this ountry fourteen years after its importation was prohibited was imported unlawfully. And since the accused is bound to know of the prohibition it is not unreasonable to require him to show at his peril "the facts and circumstances which rebut, or tend to rebut, the natural inference of unlawful importation."

PERSONAL RIGHTS AGAINST THE STATES

Gitlow Case.—Following the assassination of President McKinley in 1901 the legislature of New York enacted a Criminal Anarchy statute. It provides punishment for any person who advises or teaches, by word of mouth or writing or printing or publishing, the overturning of organized government by force or violence or any unlawful means. Benjamin Gitlow was convicted under this statute for having been responsible for the publication in 1919 of the "Manifesto" of the Left Wing section of the Socialist party. (Gitlow v. New York, 69 L. ed. 708.)

This Manifesto is too long and complicated for adequate analysis here. In the opinion of the Supreme Court "it advocated, in plain and unequivocal language, the necessity of accomplishing the 'Communist Revolution' by a militant and 'revolutionary Socialism,' based on 'the class struggle,' and mobilizing the 'power of the proletariat in action,' through mass industrial revolts developing into mass political strikes and 'revolutionary mass action,' for the purpose of conquering and destroying the parliamentary state and establishing in its place, through a 'revolutionary dictatorship of the proletariat,' the system of Communist Socialism."

Gitlow contended that the statute as construed by the state courts was void as depriving him of liberty without due process of law, because it penalized the mere utterance of doctrine "having no quality of incitement," because there was no evidence of any concrete result flowing from or likely to flow from the publication, and because it did not advocate any "definite or immediate act or acts" of force and was not addressed to any specified persons.

The Supreme Court held for the

first time in this case that the guaranty of due process includes the guaranty of freedom of speech and the press. But the state law was held to be a valid exercise of the police power.

Relation to Schenck Case.—Speaking by Justice Sanford the Court sought to distinguish this case from that of Schenck v. United States (249 U. S. 51, 63 L. ed. 473), where it was said that the "question in every case is whether the words are used in such circumstances and are of such a nature as to create a clear and present danger that they will bring about the substantial evils." In the Schenck case "certain acts" had been prohibited by the statute; in this case the legislature had determined generally "that utterances of a certain kind involve such danger of substantive evil that they may be punished"; therefore "the question whether any specific utterance coming within the prohibited class is likely, in and of itself, to bring about the substantive evil, is not open to consideration." The state may seek "to extinguish the spark without waiting until it has enkindled the flame or blazed into the conflagration."

Dissent. — Justices Holmes and Brandeis dissented, refusing to admit that the Schenck case could be distinguished and abiding by their dissenting opinions in the Abrams and Schaefer cases. (250 U. S. 616, 63 L. ed. 1173; 251 U. S. 466, 64 L. ed. 360.) And Justice Holmes added another classical paragraph to the literature of constitutional law: "It is said that this Manifesto was more than a theory, that it was an incitement. Every idea is an incitement. It offers itself for belief, and, if believed, it is acted on unless some other belief outweighs it, or some failure of energy stifles the movement at its birth. The only difference between the expression of an opinion and an incitement in the narrower sense is the speaker's enthusiasm for the result. Eloquence may set fire to reason. But whatever may be thought of the redundant discourse before us, it had no chance of starting a present conflagration." Surely judicial reason was never set forth more eloquently.

Whitney Case.—The case of Charlotte Anita Whitney v. California (70 L. ed. 25), involving a prosecution under the California Criminal Syndicalism Act, was dismissed without opinion for want of jurisdiction. A rehearing has, however, been granted.

Oregon Compulsory Education.—Another case involving state interference with personal rights arose out of the Oregon Compulsory Education Act adopted under the initiative and referendum provisions of the state constitution in November, 1922, to be effective September, 1926. With minor exceptions the act required the attendance of all children at public elementary schools, and thus in effect sought to abolish private schools. Manifestly it was aimed primarily at the parochial schools of the Roman Catholic Church. The act was held void. (Pierce v. Society of the Sisters of the Holy Names of Jesus and Mary, 69 L. ed. 688.) The court followed the doctrine of Meyer v. Nebraska (262 U. S. 390, 67 L. ed. 1042), which held void as applicable to private schools a law prohibiting the teaching of German. The Oregon act "unreasonably interferes with the liberty of parents and guardians to direct the upbringing and education of children under their control," and deprives private schools without due process of law of "business and property for which they claim protection."

Kosher Law.—A New York law of 1922 prescribes a penalty for falsely representing meat to be "kosher" meat or for failure to display over meat "kosher" or "non-kosher," as the case may be, where both kinds of meat are sold in the same place of business. It was held that the statute was not void for want of any ascertainable standard of guilt because of the indefiniteness and uncertainty of meaning of the word "kosher." (Hygrade Provision Co. v Sherman, 69 L. ed. 169.) The punishment is not provided for mistakes but for fraud. Furthermore, the evidence, while conflicting, warrants the conclusion that "the term 'kosher' has a meaning well enough defined to en able one engaged in the trade to correctly apply it; at least as a general thing."

Garnishment.—Due process of law does not require that a judgment debtor shall be given notice and an opportunity to be heard before the issuance of a garnishment against his wages, debts, earnings, salary, etc. (Endicott Johnson Corp. v. Smith, 69 L. ed. 49.) A defendant who has had his day in court need not "after a judgment has been rendered against him, have a further notice and hearing before supplemental proceedings are taken to reach his property in satisfaction of the judgment."

LIQUOR PROHIBITION LAWS

Search of Automobiles.—The National Prohibition Act prohibits the search of a "private dwelling" without a warrant and the search of any "other building or property" without a warrant "maliciously and without probable cause." Thus "it left the way open for searching an automobile, or vehicle of transportation, without a warrant, if the search was not malicious or without probable cause." Is this in consonance with the Fourth amendment? The Supreme Court says that it is. (Carroll v. United States, 69 L. ed. 347.) "On reason and authority the true rule is that if the search and seizure without a warrant are made upon probable cause, that is, upon belief, reasonably arising out of circumstances known to the seizing officer, that an automobile or other vehicle contains that which by law is subject to seizure and destruction, the search and seizure are valid."

From the beginning of our history Congress has made a distinction between the search for contraband goods in a dwelling house or similar place and the search for like goods in course of transportation "where they readily could be put out of reach of a search warrant." A warrant therefore is not necessary for the search of an automobile for liquor. But there must be reasonable and probable cause. "It would be intolerable and unreasonable if a prohibition agent were authorized to stop every automobile on the chance of finding liquor."

In this case the court held that negotiations between prohibition agents and the defendant bootleggers for the purchase of liquor, which negotiations ended in no delivery, furnished sufficient cause for the search of the defendants' motor car some two and a half months later on an open road that was a well known bootleggers' route. Justices McKenna and Sutherland dissented.

Possession of Liquor.—The only other prohibition case of importance decided during the year was that which sustained a drastic Georgia law that prohibited the mere possession of liquor in the state. (Samuels v. McCurdy, 69 L. ed. 371.) The petitioner in the case had lawfully purchased his liquor in 1907 and 1915. He held it in his residence for personal use only. The Court held that the law was not ex post facto, since the penalty imposed was not for having purchased the liquor but for "continuing to possess the liquor after the enactment of the law." Nor was the law lacking in due process. The ultimate object of prohibition is to prevent any one from drinking liquor. If men are permitted to possess liquor for their own consumption there is danger of its becoming accessible to others.

"Legislation making possession unlawful is therefore within the police power of the states as a reasonable mode of reducing the evils of drunkenness." The fact that the law provided for the destruction of seized liquor by court order without requiring that the former possessor be given notice was also not a denial of due process. "If he desired to try the validity of the seizure, or the existence of the exception by which his possession could be made to appear legal, he could resort to suit to obtain possession . . . as he has done in this case."

LABOR LEGISLATION

Kansas Industrial Court.—The last shreds of the Kansas Industrial Relations Act were scattered to the winds in the second case of Wolff Packing

Co. v. Court of Industrial Relations of Kansas (69 L. ed. 499). In the first case (262 U. S. 522, 67 L. ed. 703) the Supreme Court held invalid that portion of the act which authorized the so-called court to fix wages. In the second case it held void the portions authorizing the fixing of hours of labor. The principle and reasoning of the first case governed the second. The act did not confer upon the "court" authority generally to fix wages and hours of labor. This authority was part and parcel of a system of compulsory settlement of industrial disputes in "essential industries," to the end that the business shall go on.

It is this system which the Court finds offending. After reviewing the earlier decision the opinion runs: "The system of compulsory arbitration which the act establishes is intended to compel, and if sustained will compel, the owner and employees to continue the business on terms which are not of their making. Such a system infringes the liberty of contract and rights of property guaranteed by the due process of law clause." As part of the system the power to fix hours of labor "shares the invalidity of the whole."

Workmen's Compensation.—On the other hand, the liberty of contract protected by the Fourteenth amendment is not invaded by a Nebraska law which limits attorneys' fees in case arising under the workmen's compensation act to such sums as the court might allow (Yeiser v. Dysart, 69 L. ed. 504). A large portion of those who come under the act need to be protected against improvident contracts. Moreover "an attorney practices under a license from the state and the subject matter is a right created by statute." The state may therefore attach conditions to the license to accomplish a public good.

Minimum Wages.—In 1923 the minimum wage act applicable to the District of Columbia was declared void by a vote of five to three, Justice Brandeis not participating (Adkins v. Children's Hospital, 261 U. S. 525, 67 L. ed. 785). Justice McKenna was one of the majority. With his retirement and the appointment of Justice Stone, it was possible, without Justice Brandeis, for the Court in another such case to divide four to four as it had in the first minimum wage case. This would manifestly have produced an anomalous situation. If Justice Brandeis voted, however, and if Justice Stone regarded minimum wage legislation as constitutional, it would have been possible to overrule the Adkins case.

This possibility was shattered by a memorandum filed on October 19, 1925, in which the Court held the minimum wage law of Arizona void on the authority of the Adkins case (Murphy v. Sardell, 70 L. ed. 25). Justice Brandeis alone dissented, thus putting himself on official record for the first time. Justice Holmes requested "that it be stated that his concurrence is solely upon the ground that he regards himself bound by the decision in Adkins v. Children's Hospital." Heretofore Justice Holmes has not usually regarded himself as bound by previous decisions to which he has vigorously dissented. But for some time to come minimum wage legislation appears to be a dead issue.

PUBLIC UTILITIES

Rate Making.—As might be expected there was during the year the usual crop of public utility cases arising under the due process clause. Nothing new in principle was involved in any of the rate-making cases. Ohio Utilities Co. v. Public Utilities Commission of Ohio, 69 L. ed. 293, reversed a "capricious" rate-fixing order of the Commission. So also an order of the Washington Department of Public Works in respect to rates for hauling logs was held void where the finding was "made upon evidence which clearly does not support it" (Northern P. R. Co. v. Department of Public Works, 69 L. ed. 485). The New York Transit Commission was enjoined from enforcing an order of 1912 in respect to a joint street railway fare which in the course of time had become confiscatory (Banton v. Belt Line Ry. Corp., 69 L. ed. 615).

Sidetrack Switching.—There was likewise nothing new in principle in the case which held that a railway company could be compelled to continue to operate a sidetrack switching service which had in itself become unprofitable (Western & Atlantic R. v. Georgia Public Service Commission, 19 L. ed. 515); or in the case which held that a street railway company could be compelled to maintain operation of an unremunerative part of its line (Fort Smith Light and T. Co. v. Bourland, 69 L. ed. 307); or in the case which held that an order to extend gas mains is not unreasonable or invalid because the rate fixed by law is non-compensatory, since the rate is not involved and the company may take appropriate steps to save its property from confiscation (New York *ex rel.* Woodhaven G. L. Co. v. Public Service Commission, 70 L. ed. 92).

Interstate Commerce — Chicago Drainage Canal.—Perhaps the most significant interstate commerce case of the year was that of the Sanitary District of Chicago v. United States, 69 L. ed. 200. For more than eleven years this case has been in the courts. The United States District judge, according to his own statement and without valid excuse, kept it six years after its submission to him before he finally delivered an opinion in 1920. It concerned the competence of the United States to determine the amount of water which the Sanitary District might drain from Lake Michigan into an artificial channel flowing into the Desplaines river and ultimately into the Mississippi.

The United States brought action to enjoin the District from withdrawing the amount of water required by state law to be withdrawn, or any amount in excess of that allowed by the Secretary of War acting under authority of Congress. In the language of Justice Holmes the District "took the bull by the horns" and denied the right of the United States to interfere.

Needless to say the Court rendered a smashing decision in vindication of the federal competence. This was not a controversy between equals. The power of the United States to prevent obstructions to interstate and foreign commerce is superior to that of the states to provide for the welfare of their inhabitants. Even if the United States had given its consent (which an analysis of its acts showed that it had not done) it would not be estopped from subsequently asserting its paramount authority. Any other conclusion than that reached by the Court would have been unthinkable.

Intrastate Commerce.—The case of Houston, E. & W. T. R. Co. v. United States (234 U. S. 342, 58 L. ed. 1341, known as the Shreveport Case and decided in 1914) was an epoch-making decision in the law of interstate commerce. Now comes Lancaster v. McCarty (69 L. ed. 396) somewhat extending the rule of the Shreveport Case. Two rugs were damaged in being shipped from one point to another wholly in Texas. They were shipped under regulations of the Interstate Commerce Commission with respect to the classification of traffic and fixing of rates, which regulations were established pursuant to the decision of the Shreveport Case. These regulations permitted limitation of the carrier's liability on the bill of lading. The Texas law prohibited railroads from limiting their liability as it existed at common law.

The Shreveport Case held that the Interstate Commerce Commission, in order to prevent discrimination against interstate commerce, might direct railroads to ignore rates fixed by the state commission for intrastate traffic. This case holds that classification and rates are bound together. "The Interstate Commerce Commission, therefore, had full authority to issue this order for the adoption of the Western Classification for intrastate points between Houston and Cisco, both in Texas. The conflict between the revised statutes of Texas and the order of the Interstate Commerce Commission can only be settled by the recognition of the supremacy of the federal authority."

Exclusion of Harmful Shipments.—A further recognition of the police power of Congress as derived from the commerce power was made in the case sustaining the constitutionality of the National Motor Vehicle Theft

Act (Brooks v. United States, 69 L. ed. 398). The cases upholding the laws excluding from interstate commerce diseased stock, lottery tickets, adulterated articles, persons transported for immoral purposes, intoxicating liquors, and prize fight pictures were relied upon. In all of these cases the law aimed to prevent interstate commerce from being used to accomplish harmful results to the people of other states.

Child Labor Products.—The child labor law enacted under the commerce power and declared void by the Court (Hammer v. Dagenhart, 247 U. S. 251, 62 L. ed. 1101) was distinguished. This was "a congressional attempt to regulate labor in the state of origin. Articles made by child labor and transported into other states were harmless, and could be properly transported without injuring any person who either bought or used them." While the decision upholding this theft act was undoubtedly sound and the act itself useful, it is nevertheless difficult to see why the argument used in the child labor case does not also apply here. Is it not an attempt to regulate theft in the state of origin? Is not a stolen motor car harmless, and can it not be transported without injuring any person who innocently buys or uses it?

Michigan Common Carrier Law.—Transportation of goods and passengers by motor vehicle has become so common and is developing so rapidly that three decisions of the Supreme Court in respect to such transportation across state lines are of unusual practical significance. One of them concerned a Michigan law which declared all persons engaged in the transportation of persons or property for hire by motor vehicle to be common carriers, and required them to furnish indemnity bonds and to pay fees for engaging in the business. As applied to a person who under three contracts engaged in the transportation of goods from Detroit to Toledo the act was held void (Michigan Public Utilities Commission v. Duke, 69 L. ed. 207). The plaintiff was held to be a private carrier, not undertaking to carry for the public. To put upon him the duties and liabilities of a public carrier and the obligation of furnishing an indemnity bond was to burden and interfere with interstate commerce. Moreover, to transform a private carrier into a public carrier by legislative fiat deprives of property without due process.

Washington Bus Case.—The second case involving interstate transportation by motor vehicle arose out of a law of Washington which required that common carriers by motor vehicle for hire should obtain from the director of public works a certificate of convenience and necessity. The plaintiff was refused permission to operate an auto stage route from Seattle to Portland on the ground that the territory was already adequately served. The Court held that the primary purpose of the act was not to regulate the uses of the highways in the interest of safety but to prohibit competition. It was a regulation of interstate commerce, not merely a burden but an obstruction. As applied to interstate carriers the act was void (Buck v. Kuykendall, 69 L. ed. 301).

Maryland Bus Case.—The third case, arising out of a Maryland law was practically identical with the case just mentioned. Reference had been made in that case, however, to the fact that the highway involved in Washington had been built with federal aid. In the Maryland case the Court said that this was not material to the rule laid down (Bush & Sons Co. v. Maloy, 69 L. ed. 303). "The Federal legislation is of significance not because of the aid given by the United States for the construction of particular highways, but because those acts make clear the purpose of Congress that state highways shall be open to interstate commerce."

FEDERAL TAXATION

Salaries of Judges.—There were during the year only two cases arising under federal tax laws that involved questions of constitutionality. In 192 the Supreme Court decided the delicate question that a tax upon the salaries of judges levied after their appoint ment to office was a diminution of their "compensation" and was therefore prohibited by the constitution (Evans v. Gore, 253 U. S. 245, 64 L. ed. 887). In 1925 the Court applied the same rule to the salaries of judges appointed subsequent to the enactment of the tax law (Miles v. Graham, 69 L. ed. 686). The question depended upon the import of word "compensation" in the constitutional provision. In the Court's opinion the compensation referred to was fixed exclusively by the salary law, whether that law was enacted before or after the tax law, and whether the judge was appointed before or after the tax law was passed. Thus is it settled that the salaries of federal judges are not subject to income tax under any circumstances, Justice Brandeis dissenting without opinion.

Cuban Subsidies.—A New Jersey corporation, owning and operating a railroad in Cuba, received subsidies from the Cuban government. These were held not to be income within the meaning of the Sixteenth amendment (Edwards v. Cuba R. Co., 69 L. ed. 717). "The subsidy payments were proportionate to mileage completed; and this indicates a purpose to reimburse plaintiff for capital expenditures." They were not profits or gains and do not constitute income.

STATE TAXATION

Transfer of Tangible Property.—Two important points in respect to state inheritance tax laws were decided in Frick v. Pennsylvania (69 L. ed. 692). Under the Pennsylvania law the attempt was made to tax the transfer of tangible personal property of the Frick estate having its situs in New York and Massachusetts. It had long ago been held that corporations could not be taxed on such property (Union Refrigerator Transit Co. v. Kentucky, 199 U. S. 194, 50 L. ed. 150); and other cognate points had been settled by the Court, but not this precise issue. It was urged by Pennsylvania that the tax was not upon the property but upon its transfer only. The courts help that the transfer of this tangible personal property took place and was subject to tax only in the state of its situs. "True, its owner was domiciled in Pennsylvania, but this neither brought it under the jurisdiction of that state nor subtracted anything from the jurisdiction of New York and Massachusetts. In these respects the situation was the same as if the property had been immovable realty."

The contrary rule as to intangible personalty remains as established (Blackstone v. Miller, 188 U. S. 189, 47 L. ed. 439; Bullen v. Wisconsin, 240 U. S. 625, 60 L. ed. 830). Also the case was distinguished from that in which a tax is imposed by a state on the transfer of stock of a corporation of that state, which stock forms part of the estate of a nonresident, the graduated tax being imposed with reference to the value of the entire estate (Maxwell v. Bugbee, 250 U. S. 525, 63 L. ed. 1124). In such case the state does not attempt to tax the transfer of outside property. The only bearing which such property has is that it affects the rate of the tax imposed on property that is within the state.

So likewise the case was distinguished from that in which tax exempt bonds of the United States were allowed to be included in an estate for inheritance-tax purposes (Plumer v. Coler, 178 U. S. 115, 44 L. ed. 998). "The objection to the present tax is that both the property and the transfer were within the jurisdiction of other states."

The second point decided in this notable case is that stocks of corporations of other states must be computed by the state of domicile with a deduction for the transfer taxes paid in those states. The theory upon which this rule rests is that these stocks could not be brought within the jurisdiction of Pennsylvania at all for purposes of taxing their transfer until such transfer taxes as were imposed by the states which created the corporations had been satisfied. Those states were "lienors in possession"; and "so much of the value as was required to release the superior claim of the other states was quite beyond Pennsylvania's control."

Inheritance Tax Deductions.—The inheritance-tax law of California provides that no deduction shall be made for any inheritance tax paid to the United States. In consequence the law results in imposing "a much larger proportionate tax on the succession to the residuum of a large estate than a smaller estate, although the residuary estate and the residuary legacy be equal in each instance." It was urged that this was a denial of equal protection "since the privilege of receiving residuary legacies of like amounts by persons of like relationship is subjected to unequal taxation, the inequality depending upon the size of the estate." The Court held, however, that the California law combined the principles of a tax on the transfer of property at death and a tax on the privilege of succession; that both could be made the basis of classification in a single taxing statute; and "that the amount of tax which the legatee shall pay may be made to depend both on the total net amount of the decedent's estate passing under the inheritance and testamentary laws of the state, and the amount of the legacy to which the legatee succeeds." Such a statute is not unreasonable (Stebbins v. Riley, 69 L. ed. 456).

Effect of Corporation Taxes.—Differing tax laws of two states were held void as imposing an undue burden on interstate commerce. The first of these, an Ohio statute, imposed on foreign corporations having common stock without par value an annual license fee of five cents per share upon the proportion of the number of shares of *authorized* common stock, represented by property owned and used and business transacted in the state. The Court held that the act violates the commerce clause (Air-way Electric Appliance Corp. v. Day, 69 L. ed. 10). "The inevitable effect of the act is to tax and directly burden interstate commerce of foreign corporations permitted to do business in Ohio, and engaged in interstate commerce, wherever the number of shares authorized, subject to the charge of 5 cents each, exceeds the number of outstanding shares attributable to or represented by the corporation's property and business in that state."

The act also violates the equal protection clause. For "plainly the fee, to the extent that it is based on a number of shares in excess of those oustanding, has no relation to what was paid in for the stock, or to its value, or to the amount of the plaintiff's capital, its property, or its business, intrastate in Ohio or interstate. The act, in its practical operation, does not require like fees for equal privileges held by foreign corporations in Ohio under the same circumstances. Unless, under the laws of the state where organized, they chance to be authorized to issue the same number of nonpar-value shares, the annual franchise fees imposed on foreign corporations having the same amount of property and business, and exercising the same privileges in Ohio, will not be the same."

Missouri Franchise Tax.—Interstate commerce was also held to be burdened by a Missouri "franchise" tax that was levied upon a Maryland corporation which owned and operated an oil pipe line extending from Oklahoma through Missouri into Illinois, but neither receiving nor delivering oil in Missouri. Its principal office was in Missouri, where it also employed many persons, maintained telegraph and telephone lines, auxiliary pumping stations, automobile passenger and truck services, and exercised the right of eminent domain. The Court held that the "tax was one upon the privilege or right to do business," and that despite its ancillary businesses within the state, the business of this corporation was wholly interstate. Its operations within the state did not constitute "the doing of a local business." Hence the tax was held invalid as applicable to this corporation, Justice Brandeis dissenting (Ozark Pipe Line Corp. v. Monier, 69 L. ed. 210).

Licenses on Interstate Business.—As might have been expected by those who have followed the course of interstate commerce decisions, an ordinance of Portland, Oregon, which required persons who take orders from place to place and who receive deposits in advance to secure licenses and file bonds, was held inapplicable to solicitors of a company engaged entirely in the business of transporting goods in interstate commerce upon such orders (see case of Real Silk Hosiery Mills v. Portland, 69 L. ed. 639).

Special Tax Assessments.—Viewed in the light of the railway-aid legislation of the middle nineteenth century there is something mildly ironical about present-day laws which lay special assessments upon railway corporations for road improvements. Such laws, have, however, been previously upheld; and there was really nothing new in the case which sustained such an assessment by a road improvement district in Missouri, the assessment having been subsequently ratified by special act of the State legislature (Kansas City S. R. Co. v. Road Improvement District No. 3, 69 L. ed. 142). The railway contended that it would receive no benefit and that because of disproportions it was denied equal protection. The Court held that "under the evidence produced, it is an entirely admissible view that the railway property will be substantially benefitted by the road improvement, and that the benefits are fairly assessed as between that property and the farm lands and town lots. . . . Forecast and estimate based on a solid premise of fact and experience are not to be confused with mere speculation and conjecture."

In another case it was held that due process does not require that the preliminary expenses of a proposed road improvement, which was abandoned, should be assessed according to benefit instead of according to assessed valuations of property for tax purposes. This was true even where the tax imposed on the railway corporation was in excess of the unconfirmed estimated benefit (Missouri P. R. Co. v. Western Crawford Imp. Dist., 69 L. ed. 74).

An improvement district in Arkansas included certain lands belonging to the United States, which of course were not assessed. After the completion of the improvement the United States conveyed the lands; and the district commissioners, acting under warrant of state law, made a reassessment and included these lands. This action was held void as a deprivation of property without due process (Lee v. Osceola & Little River Road Imp. Dist., 69 L. ed. 704). This was not the case of general taxes assessed after the government title had passed. The tax was imposed for benefits accruing from improvements made while the United States still owned the property. "Such a liability for the further assessments of taxes would create a serious encumbrance upon the lands, and its subsequent enforcement would accomplish indirectly the collection of a tax against the United States which could not be directly imposed."

NATIONAL AND STATE CIVIL SERVICE

BY CLINTON ROGERS WOODRUFF

HONORARY SECRETARY, NATIONAL MUNICIPAL LEAGUE

THE FEDERAL SERVICE

Improvement of Tests.—The outstanding developments in civil service administration during the past year are to be seen in improved administration and in the effecting of economies and a very marked increase of efficiency in personnel rather than in any single notable extension of the merit system by legislation or executive orders. Much more work is being done and of a higher order, without marked increase in the number of employees. An increasing proportion of higher positions is being filled by promotion instead of from the outside; and the service is becoming more inviting as a career.

Progress has been marked in improving the examinations so as to test knowledge and the ability to apply that knowledge; and especially in testing the aptitude of candidates with respect to adapting themselves readily to the particular position for which examined. This has been demonstrated by definitely ascertaining the relation between the performance of candidates in the examinations and their actual production following appointment in the performance of their duties. For example, it was found that the work of two hundred distributors in the Chicago Post Office from day to day could be definitely measured. They were subjected to various types of tests until a test was arrived at which bore a close correlation with their accomplishment on duty. Thus a test could be applied to grade applicants justly according to their relative abilities. Tests have been devised in the railway mail and other branches of the service by a similar process which definitely establish the actual ability of the candidates tested as measured by their efficiency following appointment in the course of their actual work.

Reductions of Force.—The public is more interested in economies effected by reduction of force. However, the increased business of the country has caused an increase of about 5,000 employees in the postal service. The payment of the bonus to veterans, the agricultural census, the valuation work of the Interstate Commerce Commission and other new activities created by legislation offset reductions of force, and resulted in about 10,000 additional employees.

In reduction of force care has been taken to conserve training by treating the service as a whole and transferring surplus employees to parts of the service where their experience can be utilized. In an order of June 4, 1925, the President issued rules to govern the selection of employees in reductions of force, giving credits for military service, seniority, dependency.

Number of Employees.—The nearest estimate which can be made of the whole number of employees in the competitive classified service is 415,000, of whom approximately 270,000 are in the postal service. This number excludes all positions subject to confirmation by the Senate, among which are Presidential postmasters; also positions excepted from competitive examination under Schedule A of the civil service rules, and unclassified examination under Schedule A of the civil service rules, and unclassified laborers.

Legislation to provide for the inclusion of all postmasters within the jurisdiction of the Civil Service Commission, which was advocated by the President in his message to Congress, has not made any progress, due largely to the political interest that attaches to these places.

Salary Increases.—A flat increase of $300 in salaries paid to employees in the postal service, about 300,000 in number, has been made. Unskilled postal laborers now have an entrance salary of $1500 a year and the National Federation of Federal Employees is calling to the attention of Congress and high executive and administrative officers that this should mean the establishment of a minimum wage of $1500 in the federal service.

Classification.—Some slight gains have been made to the classified service by the inclusion of positions heretofore filled without examination. Appointing officers are increasingly desirous of making avail of the expert machinery of the Commission in testing the qualifications of applicants both for original entrance to the service and for promotion.

The retirement system greatly promoted efficiency. It is supported wholly by enforced deductions from the salaries of employees, and the fund to their credit exceeds forty-five million dollars. The Government would profit by more liberal annuities. The purity of the service has been aided by investigation of the careers of applicants to discover frauds; the finger-print system and comparison with police records being used where important. Prosecutions have been instituted as a deterrent to fraud.

Oral and Physical Tests.—Oral tests have been devised which are found to be helpful in testing the personality of applicants for higher positions where personality is an important element, as, for instance, positions the duties of which require meeting the public. These tests embrace such qualities as appearance, force of character, initiative, keenness of perception, judgment and coherence in spirit. Physical tests are more generally required for entrance to the service, promoting health and minimizing accidents, insuring not merely employees free from disabling defects, but reducing the liability of the Government for compensation due to disability.

Commissioner Gardener.—Mrs. Helen H. Gardener, the first woman to serve as a Civil Service Commissioner, died in office July 29, 1925. She served from April 13, 1920, a period of marked advance in the merit system and the ideals for which it stands. The Retirement Act and the Reclassification Act were achievements during her period of service. Her contribution in making the civil service an inviting career for women and in bringing the personal needs of the service to public and Congressional attention was especially notable. Many discriminations and injustices, both to men and women, existing in the departments were relieved by her efforts, in coöperation with her colleagues, and she was equally zealous in the uplift of men as she was in the uplift of women. The women employees of the Commission will cherish her memory because of her solicitude in their welfare and in according them opportunity for self-expression and for advancement equally with men employees.

The *Bulletin* of the Commission said that "her contribution in making the civil service an inviting career for women and in bringing the personnel needs of the service to public and Congressional attention was especially notable. Many discriminations and injustices, both to men and women, existing in the departments were relieved by her efforts in coöperation with her colleagues, and she was equally zealous in the uplift of men as she was in the uplift of women." President Coolidge appointed Miss Jessie Dell, of Georgia, a Democrat, to succeed Mrs. Gardener. Miss Dell has been in the Government service for many years.

U. S. Bureau of Efficiency.—This Bureau is charged by law with two functions relating to Government personnel, namely: (1) the establishment of a system of efficiency ratings for the classified service in the several executive departments in the District of Columbia, and (2) the administration of the Classification Act of 1923 in conjunction with the Bureau of the Budget and the U. S. Civil Service Commission through the Personnel Classification Board, whose membership consists of one representative of each of the three establishments.

During the past year, the Bureau has completely revised the system of efficiency ratings applicable to departmental employees, and has extended the system to embrace virtually all employees in the classified departmental service. Two ratings have been made under the amended system, the first as of November 15, 1924, and the second as of May 15, 1925. The system is operating satisfactorily, and the ratings established thereby constitute the basis for promotions, demotions, dismissals for inefficiency and separations on account of reduction in force. This Bureau assigns certain members of its staff to the Personnel Classification Board, who work under the direction of the Board.

Classification.—The salary scale established by the Classification Act of 1923 for positions in the Departments and Independent Establishments at Washington became effective on July 1, 1924. The application of this new scale resulted in raising the average annual compensation of the 54,000 employees affected from $1,674 to $1,749, a *per capita* increase of $75 per annum. Under the Act a range of compensation is provided for each grade of position and the salary rates fixed initially for the majority of positions fall toward the lower part of the various salary ranges. Assuming that eventually the average of the salaries will rise to the middle of the range for each kind of employment a further *per capita* increase of about $66 may be expected. This, however, will depend upon the appropriations that may be made by Congress.

Personnel Classification Board.—On July 30, 1924, the Personnel Classification Board — the agency charged with the administration of the Act—published specifications of the 300 classes of positions established by the Board for the 54,000 positions in the service at Washington. In November, 1924, the Board, in the exercise of authority vested in it by the Act, reviewed and approved a system of efficiency ratings proposed by the Bureau of Efficiency for positions at Washington subject to the Classification Act. Under this system the graphic scale method of rating is used and a number of different elements are rated according to the class of work involved. This marks a radical change from the former system established by the Bureau of Efficiency in 1921 in which judgments of rating officers were expressed in numerical terms and but two elements, quantity and quality, were considered.

Upon the recommendation of the Board, the President on June 4, 1925, issued an Executive Order rescinding a provision of a former Executive Order which was a part of the old efficiency rating system and which provided for separations on account of reduction of force in the reverse order of efficiency ratings, and providing instead that to the efficiency rating of all those rated as satisfactory workers should be added credits for length of service and permitting a small additional credit for dependents. The order provides, further, in accordance with law, that veterans whose efficiency ratings are "good" (80% or above) are to be preferred for retention and that with this exception separations and demotions shall be made on the basis of the rating thus arrived at beginning with those having the lowest ratings.

The National Civil Service Reform League believes that the personnel problem of the government should be centralized in one agency and that the agency best fitted for the work is the Civil Service Commission. Therefore in accordance with the League's recommendations a bill was introduced in the last session of Congress by Mr. Lehlbach, the Chairman of the Civil Service Committee of the House, which would abolish the Reclassification Board and transfer all the work and the functions of that Board to the Civil Service Commission. This bill passed the House of Representatives in the closing days of the last session, but was held up in the Senate just before adjournment.

Merit System in Prohibition Enforcement.—By the Prohibition (Volstead) Act of October 28, 1919, the prohibition enforcement force, other than clerks, is allowed to be appointed without regard to the civil service rules. This is generally admitted to be one of the worst features of the system. The Anti-Saloon League formally announced that at the session of Congress beginning in December, 1925, it would urge the passage of the provisions of the Cramton Bill applying civil service rules, which failed at the last session. Such an amendment to the Prohibition law would conform to the public will and conscience under the terms of the Eighteenth Amendment to the Constitution. The National Civil Service Reform League has persistently advocated this change, maintaining, as now the Anti-Saloon Leagues does, that no small part of the inefficiency of prohibition enforcement is due to the fact that enforcement officers are chosen on the spoils basis. In a formal statement issued in August it declared that the Anti-Saloon League "is not seeking to dictate appointments but it is fighting against their attempted domination by the enemies of the law and its enforcement." Asserting that "certain papers had misconstrued as opposition to the plan a recent statement by officials of the League that if it 'does not work nothing will,'" the group signing this pronouncement said the League "has long advocated the reorganization of the prohibition unit so as to place responsibility definitely; to exclude political influence and to secure coöperation from the various Government departments. Accepted as a step in this direction the new reorganization (infra) merits support. The measure of its success will depend upon the freedom with which it is permitted to operate."

A radical reorganization was made of the Prohibition Bureau, General Lincoln C. Andrews, under direction of the Secretary of the Treasury, working in collaboration with Commissioner Blair of the Internal Revenue Service, and Commissioner Haynes of the Prohibition Unit. The country was divided into twenty-two sectors, the divisions being bounded by Federal judicial district lines, with a view to removing the question of enforcement from state influence and making it entirely a Federal matter. For each sector a prohibition administrator was appointed, selected for personal fitness and executive and business ability, with full authority, and he is held accountable for the enforcement of the law and all personnel within his district. The plan is one of decentralization, with a view to economy and efficiency, to permit the use of a smaller personnel with higher qualifications. The Washington headquarters serve to maintain a uniform policy and coöperation among the districts. It is believed that the Federal function in prohibition enforcement is to stop the sources of supply; importation; diversion of illegitimately manufactured alcohol; the illegitimate manufacture and transportation of alcohol and alcoholic beverages. Federal law-enforcement energies will be directed primarily against the bootleg industry in all phases of operation. Effort will be made to assist and develop local enforcement.

Bureau of Public Personnel (Fred Telford, 26 Jackson Place, Washington, D. C., Director).—One of the major projects of this Bureau has been the preparation of a series of articles dealing with classification and salary standardization in the public service. It was an ambitious attempt to formulate the best practices developed in this field as the result of surveys and formal research work for which from $2,000,000 to $3,000,000 of public money had been spent. In coöperation with a committee of the American Library Association a classification and salary standardization plan for the whole library profession was also worked out. A critical appraisal of the teacher-examining and related work in a number of eastern states and cities was made and published. In view of the existing confusion in public-service employment terminology, recommendations were made for the use of about 100 carefully selected and carefully defined terms. About half of the time of the staff of the Bureau had been devoted to the preparation of tests for specific classes of positions. Most of these tests represent the judgment of the Bureau staff as to the best civil service, industrial, and psychological practice; for some of the classes standardized tests have been developed. In every case the test material has been published or otherwise made available for public and industrial personnel administrators. Standardized tests were worked out and published for bacteriologist, pathologist, and automobile driver, and suggested tests were prepared and published for patrolman, fire fighter, food inspector, senior clerk, supervising clerk, prison guard, hospital attendant, painter, janitor, and senior library assistant.

National Assembly of Civil Service Commissions (Charles S. Shaughnessy, Chief Examiner of the Civil Service Commission of Philadelphia, Secretary), organized in 1906, met in Los Angeles, Cal., June, 1925, with David J. Reese, of California, presiding. Oliver C. Short of Maryland was elected president for 1925-6. The 1926 meeting will be held in Philadelphia.

Joint Report on Civil Service.—A joint committee on civil service, representing the National Municipal League, the National Civil Service Reform League, the Association of Civil Service Commissions and the Governmental Research Conference, has prepared a report, which contains a survey of the present situation respecting the merit system in city and state government; recommendations regarding the form of organization of the personnel agency, and proposals for a law covering the subject. Charles P. Messick, secretary of the New Jersey state civil service commission, in coöperation with Fred Telford of the Bureau of Public Personnel Administration, carried the burden of drafting the report. Colonel H. M. Waite, former City

Manager of Dayton, who represents the National Municipal League, was chairman of the committee.

Civil Service in Canada. The Civil Service Research Branch of the Citizens' Research Institute of Canada has been organized with Principal W. L. Grant of Upper Canada College as its head. This organization is patterned after the National Civil Service Reform League (q.v.). The movement has grown out of the action of the Citizens' Research Institute, which declared for an educational campaign for the purpose of enlightening public opinion on the importance of proper public personnel administration in its relation to effective and economical government. The operation of the Canadian Civil Service Administration has been the subject of House and Senate reports by the Canadian Parliament. The result, as indicated in the Malcolm report of the House of Commons of 1923 and the Senate report of 1924, is a general endorsement of the merit system and its administration in the Dominion of Canada.

Local Standardization.—The Board of Supervisors of the City and County of San Francisco appropriated $5000 to the Civil Service Commission for a classification survey and to prepare a plan of salary standardization for 1926. This action was taken to carry out a recently adopted charter amendment prescribing such procedure.

A legislative Investigating Committee in New Jersey (known as the Bright Committee) made a comprehensive survey of every department, board, commission, institution and agency with a view to presenting to the Legislature of 1926 a comprehensive plan of reorganization for the entire State government.

Classification and salary standardization studies have been made in Detroit and Cleveland. In Detroit the Commission is using the classification, but due to the action of the Detroit Bureau of Governmental Research, the Council did not put into effect the salary standardization. It appears probable, however, that this will be done next year. In Cleveland the work is getting well under way and the whole situation looks promising.

Civil Service in New Charters.—The new charter for Kansas City, Mo., provides for a city manager and a personnel department with the head appointed by the manager. This is an interesting experiment which may throw light on what happens to the merit system in a large city under the city manager form of government. The experiment is to some extent vitiated by the fact that the whole employment list is certified to the department head. Closely akin to this is the situation in Cleveland where a very marked improvement has come about since the city manager form of government went into effect early in 1924, but where the traditional form of civil service commission was retained.

The new charter for Fort Worth, Texas, provides for the merit system and by an overwhelming vote Oakland, California, placed the library and park employees under the merit system.

An Ohio law now makes it possible for the State Civil Service Commission to delegate to the largest municipality in any county the handling for the state commission of employment matters for that county. The Cleveland commission has been designated to act for it in Cuyahoga County.

In Detroit a labor examiner has been made a member of the staff of the City Service Commission to make a serious attack upon the selection through competitive tests of skilled, semi-skilled, and unskilled laborers. The appointment was made in May, 1925. Already there have been significant developments. Payroll padding amounting to about $10,000 has been uncovered. Two people are already under indictment for their part in these frauds.

Court Decisions on Civil Service.—A decision of the New York Court of Appeals, in what is known as the Ottinger case, is of great moment to the application of the merit law, as it defines clearly the powers of the Legislature in the matter of appointment to positions under newly-created bureaus. A statute passed in 1921 provided that "for the purpose of this article, the Attorney General may in his discretion and without civil service examination, appoint and employ, and at his pleasure remove such deputies, officers and other persons as he deems necessary and determine their duties and fix their compensation." This statute was enacted for enforcement of a class of legislation known as the "blue sky laws," with employees engaged on "confidential work."

Attorney General Ottinger, while holding that the said employees were not within the purview of the Civil Service Commission, nevertheless, submitted the payroll to the latter body for its certificate that the appointments were made according to law. The Commission refused to honor the exemption and held that the appointments were in violation of the provisions of the State Constitution in that it was practicable to determine the merit and fitness of the appointees by examination, and that no such procedure was followed and no such determination made. The case went to the Court of Appeals where a unanimous decision sustained the Commission. The Court concluded its opinion as follows: "We find no reasonable basis for a belief that in all the positions, present or future, that exist or may exist in connection with this bureau, there can be no place for a test of efficiency by any form of examination, even as a supplement to tests more intimate and personal. If the Legislature may so declare as to this bureau for no better reason than the need of secrecy, it may say as much of the employees of the district attorneys in every county in the State. By a slight and yet inevitable extension, it may make a like declaration as to other bureaus and departments. No such sweeping exemption within the limits of the administrative departments of the government has ever been proclaimed since the Constitution set bounds to the discretion of the Legislature in the formation of the civil service."

The New York constitution provides that appointments shall be made as far as practicable as the result of competitive tests.

New York courts have held that the legislature may not pick out an individual and pass special legislation for his benefit in contravention of the general provisions of the constitution. (*Brown v. Craig, Kelliher v. Quin and Brady. Barlow v. Craig & Grosback.*) They have also held that the Health Department may not by crying "contagious epidemics" justify the employment of emergency employees without compliance with the requirements of competition under the civil service clause of the constitution. (*Barlow v. Craig.*)

There is now pending before the Court of Appeals in New York State a case to test the jurisdiction of the Municipal Civil Service Commission over promotions of employees in the Department of Education (*Ryan v. Municipal Civil Service Commission*) decided in favor of the Commission in the Appellate Division of the Supreme Court.

In Colorado there has been a test of the constitutional amendment concerning the power of the Governor to remove members of the State Commission, the Supreme Court of the State holding that the members of the Civil Service Commission can be removed only by impeachment (*Hicks v. Roberts*).

National Civil Service Reform League.—During 1925 the League sponsored legislation to empower the President to place in the classified civil service all positions now exempt by statute; to provide for the appointment of all postmasters and rural carriers through the merit system; to place prohibition agents in the classified civil service; and to abolish the Federal Personnel Classification Board and to transfer its functions to the United States Civil Service Commission in order that but one agency shall deal with the technical problems of personnel. It protested against a bill to create a commissioned medical personnel in the Veterans' Bureau, thus exempting a large group of civil employees from the classified civil service, on the ground that experience has demonstrated that competent physicians can be obtained through competitive examination. The continuance of an executive order issued by President Harding providing for the appointment of one out of the first three names on eligible lists for the appointment of presidential postmaster was condemned. An investigation by the League of the operation of this order had revealed the fact that it invited political influences to dictate appointments of postmasters. Congress was urged by the League to enact a bill placing all postmasters under the merit system, and the President was urged to require the selection of the first person on the eligible list. An investigation of the appointments of deputy collectors of internal revenue indicated that the number of such positions was being increased and that they were being used as political patronage. Legislation empowering the President to place these positions in the classified service is supported by the League.

Through its field division the League endeavors to secure the adoption of civil service laws in the various states and cities. It issues from time to time pamphlets on the various fields of its investigation. Recent publications include: *The Story of the Merit System; Roosevelt and the Spoilsmen; Who Inspects Our Food? Good Government* is the official organ of the movement. The 45th Annual Meeting was held in December, 1925.

Merit System in Pennsylvania.—The Pennsylvania Civil Service Association issued during the year a comprehensive statement on the result of the two year trial of a personnel system for the state government placed in the hands of an executive board created by the Administrative Code of 1923, all appointed by the Governor. The Association finds that these provisions have proved to be inadequate, there being no personnel agency created by the act and the powers vested in the Governor having been inadequately safeguarded. The Association finds, however, that even under the inadequate provisions of the law "marked progress has been made in the work of classification of state positions." The results show a decrease in expenditures for wages and salaries of $1,382,042. It further finds that an employment retirement system has been established.

In criticism of the executive board, the Association finds that it has not carried the classification of positions in all the state departments to completion. "Loyalty to a particular administration, instead of loyalty to the state as an employer, has been emphasized in the application blank which new appointees are required to fill out," says the Association, which stipulates two specific steps which should be taken to remedy the present condition:

1. To establish a State Personnel Commission and give it broad powers over personnel matters, as provided in the draft of the State Personnel Act of 1925 (a state civil service bill sponsored by the Pennsylvania Association).
2. To give this Commission sufficient funds to employ a technically trained personnel staff equipped to handle expeditiously the varied employment problems of the state.

Conditions of Municipal Employment in Chicago.—Mayor William E. Dever of Chicago asked the City Club of that city to investigate conditions of employment in the municipal service. That Club in turn asked Professor Leonard D. White of the University of Chicago to undertake a study to stimulate a greater degree of cooperation and voluntary effort among the employees of the city especially in the classified service. This study was made possible by aid of research funds provided by the University through the Committee on Local Community Research. The formal report which is entitled "A Study in Morale" was submitted to the Council on June 10, 1925. As a preliminary of the systematic survey of all conditions of city employment, Prof. White and his associates gathered data on the question why men and women are anxious to serve the City. An infinite variety of reasons was given by competitors in entrance examinations, but "the outstanding reasons seemed to be a desire for a sense of security and a belief that on the whole the pay was adequate."

In outlining the sources of dissatisfaction on the part of employees it was pointed out that lack of recognition for good work is the chief reason for dissatisfaction. Many departments of the City government are being conducted in a praiseworthy manner, but almost no recognition is given either to the departments or to the individuals who are responsible for this.

Other causes of dissatisfaction listed and developed briefly are: "Gradual loss of initiative, maladjustment of salaries — both as to classes and persons, abuses of 'waivers,' delays in posting eligible lists, uneven discipline, and, finally, political interference with the administrative side of the government."

In developing the practice of waiving appointment, Dr. White said: "A promotion examination is held and an eligible list posted. A certain person is 125, let us say, on the list. Number 125 persuades 124, and so on up the list, to waive the privilege of getting promotion. We ran across cases where more than 100 people, after passing an examination, had said 'We don't want the chance to be promoted.'" He said that the amount of pressure brought to secure waivers was not known, but that the practice of waiving had grown to serious proportions.

As to the recommendations of a constructive character, the first was for a system of recognition of the high grade work many men and women and departments are doing. This would be in part personal, like the bonuses in the Police Department; in part departmental. It was suggested to the Mayor that he set up an annual competition between departments, with a cup for a trophy. Next it was recommended that the Mayor establish the business organization of the city, similar to the business organization of the United States Government. Its purpose would be to put the Mayor into immediate touch with some 200 heads of divisions and bureaus who are actually responsible for carrying on most of the work. On the salary problem, which urgently needs consideration, it was recommended that it be turned over to a special body, to include representation of the employees themselves. Other recommendations were for the establishment of a joint council of representatives of the employees of the department heads, the creation of an Institute of Municipal Administration, a reclassification of the service and the adoption of a strong constructive program by the Civil Service Commission.

DIVISION V

STATE AND COUNTY GOVERNMENT

NATIONAL AND INTERSTATE RELATIONS

By J. M. Mathews
Professor at the University of Illinois

The year 1925 was one of unusual activity in state governments. This was due in part to the fact that the great majority of the state legislatures meet in the odd-numbered years. Fundamentally, however, it was due to the renewed attention to, and interest in, state and local governmental affairs following the removal of the strain due to war and the disturbed state of our foreign relations.

Child Labor Amendment Controversy.—After two unsuccessful attempts to reach the child labor evil through legislation, Congress, in June, 1924, submitted to the states a proposed amendment to the Constitution of the United States, giving Congress power to "limit, regulate and prohibit the labor of persons under eighteen years of age." In an advisory referendum held in Massachusetts the following November the proposal was overwhelmingly defeated. At the legislative sessions held in 1925, a sufficient number of states rejected the proposed amendment seemingly to assure its defeat. It is of course true, however, that a change in public opinion might still save the proposal from final defeat, since a state which has rejected the amendment may later reverse its action.

Protest of Governors.—The opposition to the child labor amendment is ostensibly based largely on the ground that it constitutes an unwelcome encroachment upon the traditional sphere of state rights. Opposition to the further extension of national power at the expense of the states was especially manifest at the seventeenth annual Conference of State Governors which met at Poland Springs, Maine, at the end of June. The policy of national aid to the states on the fifty-fifty basis was denounced in so far as it enabled the National Government to exercise indirect control over matters which constitutionally belong within the sphere of state power. This policy has developed to such an extent that, for the fiscal year ending June 30, 1926, Congress appropriated approximately $130,000,000 for aid to the states in reference to such matters as highways, education and the National Guard.

The governors at Poland Springs were aroused especially on account of certain utterances which President Coolidge had recently made on the subject of National and state relations. In his Memorial Day address at Arlington he asserted that if the states fail to discharge obvious duties, the National Government would have to step in. A few weeks later he publicly condemned the laws under which the National Government distributes contributions to the states and urged the people to "realize the necessity of State assumption of State responsibility."

Basis of Objection.—While President Coolidge's opposition to so-called National aid to the states was probably due largely to the fact that it interferes with his plans for cutting down National expenditures, the opposition of the Governors to the practice was due to the feeling that it constitutes a subtle encroachment on state prerogatives. It was pointed out that National contributions to the states on the fifty-fifty basis did not really constitute National aid to the states since the National Contribution was paid for by the citizens of the various states in the form of National taxes. The opposition of Iowa to the system went so far that she announced her intention to refuse to receive further National aid in her road-building program.

Most states, however, feel that, as long as National funds are being distributed, they might as well come in for their share. Some states even go so far as to apply to the National Government for more aid than it is willing to grant. Thus, Illinois made an appeal for further National aid in her war on cattle tuberculosis, but without apparent success. Even at the Governors' Conference, some governors were willing to make exception to their opposition to the géneral policy of National aid in respect to certain specific phases; for example, National appropriations for agriculture and good roads. The opposition to National aid seems to come principally from the wealthier Eastern states which feel that their contribution in National taxes is greater than the benefit they receive from such aid, while the system works out for the financial profit of the less thickly populated states of the West and South. Governor Ritchie of Maryland has probably been the most outspoken opponent of National aid. He delivered during the year a number of public addresses on the subject in various parts of the country.

At the Convention of State Controllers and Auditors held at Miami, Fla., in November, Controller Murphy, of New York, urged that a national State Rights Conference be called to adopt protective measures against further inroads of the National Government on the powers of the states. He deprecated the widespread policy of "letting Washington do it," and pointed out that New York, Illinois, Pennsylvania, California, Massachusetts, and a few other of the large states foot most of the bills.

Inheritance Taxes.—In addition to the policy of National aid, another way in which it is felt that the National Government is encroaching on the proper sphere of the states is through the levying of National inheritance taxes. The National Government has resorted to this form of taxation only in war emergencies and has usually abandoned it promptly after the emergency passed. Since all rights of succession to property are gained under state laws, it is felt that in time of peace the states should have exclusive control of estate taxes as a source of revenue. A concerted attempt to bring pressure to bear on Congress to this end was made in October when the representatives of seventeen states, including six governors, appeared before the Ways and Means Committee and urged that the National Government should retire from the inheritance tax field. Their position was supported by Secretary of the Treasury Mellon, who, in a statement to the Committee, said: "There is no logical basis for the Federal Government collecting this tax. . . . The states need every source of revenue available. In the majority of states, the Federal tax directly decreases the property which the state can tax."

The National inheritance tax was also opposed by the National Committee on Inheritance Taxation which recommended that it should be abolished at the end of six years. Meanwhile, it recommended that the 25 per cent. credit provision of the present law should be extended so as to allow a credit of all inheritance taxes paid to the several states up to 80 per cent. of the National tax. It was recognized, however, that inheritance taxes should be substantially uniform throughout the United States; and as long as this is not the case and some states, such as Florida, even prohibit inheritance taxes in their constitutions, it would hardly be equitable to abandon the National inheritance tax altogether.

Regulation of Interstate Commerce.—Another way in which the National Government is gradually extending its control over the sphere heretofore belonging to the states is through its power to regulate interstate commerce. This power has been held to be sufficient to enable Congress to authorize the Interstate Commerce Commission to set aside orders of state commissions which, while nominally regulating intrastate commerce only, really discriminate against or place an undue burden upon, interstate commerce. As illustrating the extent of National power, a conflict arose in October between the Interstate Commerce Commission and the Illinois Commerce Commission, regarding suburban fares on the Chicago and Northwestern Railroad. In 1920 the Interstate Commission had ordered a 20 per cent. increase in Chicago suburban fares on the Northwestern to points outside of Illinois. In October, 1925, the same commission granted the same increase to points within the state, on the ground that not to do so would be to discriminate against commuters living outside of Illinois. The Illinois Commerce Commission thereupon issued an order suspending the increase on intrastate fares granted by the Interstate Commission. The Railroad then applied to the Federal courts to restrain the Illinois Commission from interfering. This application was granted and an injunction was issued by the Federal court prohibiting the Illinois Commission from interfering in the collection of the increased rates charged passengers to points within the state. The injunction was denounced by Attorney-General Carlstrom of Illinois as a far-reaching and arbitrary intervention in state matters, but is nevertheless based on decisions made by the Supreme Court of the United States.

The extension of National control over new forms of interstate commerce came up for discussion in October at the thirty-seventh annual convention of the National Association of Railroad and Utilities Commissioners held at Washington, D. C. Recent decisions of the Supreme Court of the United States holding that the states have no authority over interstate bus and truck lines were thought to foreshadow the ultimate passage by Congress of legislation regulating interstate motor traffic. The convention declined to go on record as opposed to the enactment of such legislation, although some delegates were of opinion that such legislation would result in the state commissions being deprived of any effectual power to regulate intrastate motor traffic.

Superpower Possibilities.—The recent extension of superpower systems across state boundaries has led to some expression of the need of the extension of National control over public utilities. In October, however, Secretary of Commerce Hoover in an address before the Thirty-seventh annual convention of the National Association of Railroad and Utilities Commissioners at Washington uttered a note of warning against such extension, claiming that the need for it had been greatly exaggerated. "If," he said, "we are to stretch the interstate commerce provision in the Constitution to regulate all those things that pass state lines, we shall automatically absorb to Federal authority most of the Government that lies within state lines, because our economic life has become so enmeshed that there is no longer that easy conception of our forefathers of what constituted interstate commerce. If we do not resist this extension, what becomes of that fundamental freedom and independence that can arise only from self-government?"

Chicago Lake Water Question.—Several of the states bordering on the Great Lakes united with the National Government in opposing the practice of the Chicago Sanitary District in taking 10,000 cubic feet of water per second from Lake Michigan for purposes of drainage and sanitation. The undue lowering of the waters of the Lakes also had the possibility of bringing on international complications. In January the Supreme Court of the United States held that the state of Illinois could not, by withdrawal of water from the Great Lakes, affect their level without the consent of Congress, and issued a decree limiting the amount to be taken to 4,167 cubic feet per second. It further held that the United States, in the exercise of its power to control navigable waters, regulate interstate commerce and maintain its treaty obligations, might enjoin the withdrawal of water from Lake Michigan in excess of the amount allowed by the Secretary of War. (Sanitary District of Chicago v. United States, 45 Sup. Ct. Rep., 176.)

Interstate Relations.—Various conferences of state officials for the consideration of problems of common interest have been held during the year. These include the annual conferences of governors, of state controllers and auditors, and of railroad and public utilities commissioners. In October, a Midwest governors' conference was held at Sioux Falls, South Dakota, at which the governors organized and adopted resolutions expressing their attitude on such questions as agricultural relief, waterways, and reduction of state expenditures. In November, a conference of representative men from the six New England States was held at Worcester, Massachusetts, at which the New England Council was formed for the purpose of promoting the economic and commercial interests of that section of the country.

On January 12, 1925, Governor Hunt of Arizona, in his message to the legislature, reiterated his opposition to the Colorado River Compact, sometimes known as the "Seven-State Irrigation Treaty" which was negotiated in 1922 among the seven states having water rights in the Colorado River, and which undertook to allocate such rights. Six of the seven states have ratified the agreement, which was drawn up under the supervision of Secretary of Commerce Hoover. The situation illustrates some of the difficulties of state cooperation in accomplishing common purposes.

Another illustration of the same sort is found in the controversy between New Jersey and Pennsylvania as to whether the new interstate bridge over the Delaware at Camden should be free or toll. The people of New Jersey authorized the bridge bonds at an election in which the ballots provided that the net revenues of the bridge should be devoted to payment of the bonds. On the other hand, Pennsylvania insisted that it should be a free bridge, and, in November, she secured permission from the Supreme Court of the United States to bring suit against New Jersey to enforce the interstate agreement for the construction of the bridge.

More successful, however, were the efforts of these states, together with New York, to come to an agreement regarding the joint use of the Delaware River for water supply and power. Early in the year a boundary dispute between Colorado and New Mexico was decided in favor of the former by the Supreme Court of the United States.

The difficulty sometimes encountered in extraditing persons accused of crime from one state to another was illustrated in the controversy between Wisconsin and Illinois in the Sovetsky case. Sovetsky was arrested in Illinois on the Wisconsin governor's warrant and accused of sending burglars into Wisconsin to procure merchandise for him, which he sold in Illinois. Since he had not himself gone into Wisconsin to commit the burglaries, however, the governor of Illinois refused to extradite him.

STATE LEGISLATURES

BY J. M. MATHEWS

PROFESSOR AT THE UNIVERSITY OF ILLINOIS

Legislative Organization. — There has been a noticeable tendency towards the abandonment of annual sessions of the legislature in those states which still retain them and the substitution of biennial sessions. Georgia and South Carolina both adopted Constitutional amendments providing for the change to biennial sessions. This change was also advocated by Governor Fuller of Massachusetts in his message to the legislature of 1925.

In West Virginia the plan of having the legislative sessions divided into two parts known as the split-session plan, came under the disapproval of Governor Morgan of that state. In his annual message to the legislature of 1925 he asserted that the plan had resulted in inconvenience to the members of the legislature and in added burdens to the taxpayers.

Governor Terral of Arkansas in his annual message to the legislature urged that a law should be passed limiting to thirty-five the number of employees of each house. He further advocated that a fine of $500 should be assessed on the presiding officer for every warrant issued to an employee in excess of that number.

In South Dakota a movement developed in favor of the substitution of a single chamber legislature in place of the bicameral system. A resolution containing such a proposal, sponsored by Senator Dowdell, passed the state senate by a vote of 26 to 15.

In California a constitutional amendment was adopted increasing the salary of state legislators from $1,000 to $2,400 per biennium. The members' mileage allowance, however, was decreased and the allowance for attachés for both houses was reduced.

The time-honored principle of separation of powers whereby a member of the legislature cannot hold a position in the executive branch of the state government was upheld by the Supreme Court of Illinois. In October it handed down a decision in the Sonnemann case declaring that a representative in the legislature who had also been serving as a prohibition investigator under appointment by the Attorney-General of the state must repay to the state the compensation which he had received in the latter capacity. He was also required to pay lawyer's fees to the taxpayer plaintiff.

Representation in the Legislature.—There has for some time been dissatisfaction among a number of large cities with the extent of the representation accorded them in the state legislature. Such cities as Baltimore, New York, Providence, Detroit, and Chicago have claimed that they are not allowed legislative representation in proportion to their population. The most active contest over this matter during 1925 was brought about through the efforts of Chicago and of Cook County (in which it is located) to secure additional representation. The constitution of Illinois provides that the legislature shall apportion the state every ten years upon the basis of the decennial Federal Census. This was done in 1901 but no apportionment has been made since that date. The proposed constitution of 1922 attempted to remedy the situation where the legislature fails to make an apportionment by providing that in such case it shall be the duty of the secretary of state, the attorney-general, and the auditor of public accounts to do so. This plan, however, failed of adoption along with the remainder of the proposed constitution. In the legislative session of 1925 a most determined effort was made by the Cook County representatives to secure the passage of a reapportionment measure, but the effort failed. The reason for the refusal of the down-state representatives to agree to the passage of such a measure is, of course, that a reapportionment on the basis of the last census would very considerably increase the representation of Cook County at the expense of the down-state counties. Cook County now has about 37 per cent. of the legislative membership, while, by the census of 1920 it had over 47 per cent. of the population of the state, and, in all probability, at the next census it will have more than a majority of the total population.

The down-state counties with reason fear the predominance of one county in state affairs which reapportionment in accordance with population would entail. By way of justification, however, they set up the dangerous doctrine that the constitutional provision should be ignored because the welfare of the state is the highest law. Another and more technical defense is that the constitutional provision is to be regarded as merely directory and not mandatory, and hence it is for the legislature to decide within its discretion whether a reapportionment shall be made. Some even go so far as to argue that the constitutional provision is to be construed merely as a limitation on the legislature so as to prevent it from making more than one reapportionment in any one ten-year period.

When it became evident that there would be no reapportionment at the legislative session of 1925, Cook County threatened to take more drastic measures. The Cook County board of commissioners ordered the county treasurer to withhold from the state treasurer taxes collected in the county until a reapportionment should be made. This threat, however, was not carried out. The Chicago city council passed a resolution in June to the effect that, unless a reapportionment were made at the next session, steps would be taken by Cook County to secede from Illinois and set herself up as a separate state. Inasmuch, however, as permission for such a move would have to be secured from the existing state legislature as well as from Congress, it does not seem likely that this threat can be carried out.

In June the city council also passed a resolution directing the corporation counsel to start appropriate proceedings to compel the legislature to make a reapportionment. It failed, however, to make an appropriation for the purpose, and it was left to John B. Fergus, a private resident of Chicago, to push court proceedings against down-state legislators. He maintains that all legislatures in Illinois since 1911 are *de facto* merely, on account of their failure to obey the constitutional mandate. He also claims that through this failure each legislator who voted against reapportionment has violated his oath to support the constitution, and that those legislators who are also lawyers have also violated the oaths taken when they were admitted to the bar. He further maintains that Congress should interfere in the situation because failure to reapportion leaves Illinois without a republican form of government as guaranteed to each state by the Constitution of the United States.

In October, Fergus filed a petition in the state supreme court for a mandamus to compel the legislature to redistrict the state. Permission to file the petition was granted by the court on the ground that the question as to whether the courts have jurisdiction to compel legislative action as directed by the constitution is one of such public importance that it should be determined judicially. Summonses were served on most of the legislators requiring them to answer the Fergus petition and explain why they have failed to redistrict the state. In response to such summonses, a committee of down-state legislators was appointed to conduct the defense. They entered a motion that the Fergus petition be dismissed on the ground that making a reapportionment is a discretionary power and that the court is without jurisdiction to issue a mandamus in a case of this character.

What final disposition of the matter the court will make remains to be seen. Failing a judicial settlement, it would seem that an ultimate solution of the difficulty can be found only in a constitutional amendment limiting the representation of Cook County in one house of the legislature to less than a majority while according her full representation according to population in the other house. In addition to this compromise, a full measure of constitutional home rule in local matters should also be granted to Cook County, after which any under-representation in the legislature which may still be inflicted upon her will no longer be a matter of such great consequence to its voters.

STATE EXECUTIVE AND ADMINISTRATION

By J. M. Mathews

Professor at the University of Illinois

Governor's Term.—The term of office of nearly half the governors is only two years. There has been a growing feeling that this is too short, and attempts have been made in various states to lengthen the term to four years. Such an attempt failed in New Mexico, but was successful in South Carolina, where, by constitutional amendment, the term of office of the governor, attorney-general and other state officers was increased from two to four years.

The increase in the length of the governor's term is especially important in connection with the working of state administration under the plans of reorganization adopted in a number of states in recent years. One criticism of the working of the Reorganized Administrative Code adopted in Ohio in 1921 was that the department heads change too often, so that continuity of policy is broken. This is due largely to the short two-year term of the governor. An attempt was made to remedy this situation by submitting to the voters at the November, 1925, election a proposal to increase his term to four years. Unfortunately, it failed of adoption.

Governor Smith of New York has endeavored to secure the adoption of a constitutional amendment in that state increasing the governor's term to four years, but the legislature has heretofore declined to pass the proposal for submission to the voters. With the adoption by the voters in November, 1925, of the constitutional amendment for the short ballot and the reorganization of state departments, it is expected that a renewed attempt will be made in the next session of the legislature to secure favorable action on the four-year-term proposal, since this is considered to be a logical part and corollary of the reorganization plan. Governors Sweet of Colorado and Nestos of North Dakota recommended a four-year term for the governor in their messages to the legislatures of 1925.

Governor's Pardoning Power.—In her first message to the legislature, Governor Ferguson of Texas forecast a liberal pardon policy and urged the adoption of a parole system for prisoners. How extremely liberal her policy has been is indicated by the fact that, including the 105 clemency proclamations issued on Thanksgiving Day, she has granted clemency to 1,126 prisoners during the year.

A case relating to the pardoning power of an acting governor arose in Arkansas in November. Governor Terral of that state ordered the Superintendent of the Penitentiary Farm to arrest and return to prison nine persons who had been pardoned by the acting governor during the governor's absence from the state. It was alleged that a provision of law requiring publication of the fact that application for pardon had been made was not complied with in these cases.

Actions against Governors.—Governor Davis of Kansas, upon retiring from office on January 12, was arrested by county authorities on the charge that he had accepted a bribe in return for granting a pardon. Shortly before the end of his term, Governor Davis had summarily removed Chancellor Lindley of the University of Kansas. Governor Paulen, who shortly afterwards succeeded Governor Davis, immediately reinstated Chancellor Lindley in his position.

The civil suit against Governor Small of Illinois to recover interest paid on state funds while he was state treasurer dragged along during the year. The circuit court of Sangamon County decided against the governor. An appeal was taken from this decision directly to the state supreme court, but up to December 1 no final decision had been rendered.

Relations between Governor and Legislature.—In the large majority of states legislative sessions were held in 1925 and a number of new governors were inaugurated at the beginning of the year. Among these were two women, Governors Ross of Wyoming and Ferguson of Texas. In her first message to the legislature, Governor Ferguson urged a reduction in state expenditures and recommended the imposition of a tax on factory-made cigarettes, the proceeds to be used for buildings for educational institutions.

In Connecticut, proclamation was made by the governor in November, 1924, to the effect that an amendment to the state constitution had been adopted granting the governor power to veto single items in appropriation bills. All bills, however, may still be passed over the governor's veto by a simple majority of both houses of the legislature.

In Massachusetts, Governor Fuller and the legislature were at loggerheads with each other during most of the session. The controversy centered around the control of appropriations. The legislature disregarded many of the governor's budget recommendations. The governor used his item veto freely in reducing the amount of the appropriations as passed by the legislature. Public opinion generally supported the governor, and he succeeded in carrying his point in regard to most of the appropriation bills.

A spirited contest also occurred between Governor Smith and the New York legislature, which was accentuated on account of the partisan diversity between the executive and legislative departments. The governor exercised his veto power on 154 bills out of a total of 840 passed during the regular session, of which 644 were sent to the governor on the last day of the session. In this way he succeeded in cutting down considerably expenditures which would have absorbed the surplus and prevented the reduction of taxes. He was able to secure a 25 per cent. reduction in income taxes. He failed, however, in pushing through a measure for an executive budget. A sharp contest also arose over the state park program. The governor called a special session to meet on June 22 for the purpose of carrying out the program for a state park system which had been authorized by the voters at the preceding election. He and the legislature, however, were unable to agree on the agency in which the expenditure of the money for the furtherance of the program should be vested.

Texas Controversy.—In Texas a peculiar situation arose as a result of the fact that Governor Miriam A. Ferguson is the wife of the former governor who was impeached, and her husband is now her unofficial and confidential adviser. The powers of the governorship seem in large measure to be exercised by one who holds no public office, and who, under the judgment of impeachment, was ineligible to hold any state office. In order to remove some of the anomalous features of this situation, the legislature passed a bill of amnesty declaring that the judgment of impeachment was annulled, and thus restoring to the former governor his eligibility to hold office.

More recently, charges have been made against the administration of the Fergusons on the ground that large sums of state money have been wasted in connection with the state's road-building program. Attorney-General Moody brought suit against the American Road Company, which confessed judgment for $600,000 of excess profits on road contracts let by the state highway commission, which had been appointed by Governor Ferguson on the advice of her husband. Two members of the commission thereupon resigned. The next development was a petition of legislators to the governor asking that she call a special session of the legislature for sundry purposes but in reality for the purpose of impeaching any state officials who might be involved in the road contract scandal. Under the statute, if fifty legislators sign a petition for a special session for impeachment purposes and the governor declines to act, the Speaker of the House may call the session. The necessary number of signatures were secured and the Speaker threatens to call a session if the Governor fails to do so. The movement for a special session faces the difficulty, however, that the statute makes no appropriation for the expenses of the session and private subscription for this purpose would hardly be considered appropriate.

State Administrative Reorganization.—The movement for the reorganization of the state administrative agencies along lines of greater economy and efficiency, which came into prominence with the adoption by Illinois of its civil administrative code in 1917, continues to make headway. Recommendations for reorganization were made in their messages to the legislatures of 1925 by Governors Smith of New York, Christianson of Minnesota, and Gunderson of South Dakota. Some other governors also made moves in this direction, but the most important results in the way of actual reorganization were accomplished in the three states mentioned.

In New York the original project for introducing the short ballot and state administrative reorganization, contained in the proposed constitution of 1915, went down to defeat along with the remainder of that document. The movement continued, however, and, although opposed either openly or secretly by many politicians, has received the support of public opinion and of the more statesmanlike public officials of both the major political parties.

A proposed constitutional amendment along the lines of the project of 1915 was passed by the New York legislature in 1923 and again in 1925. It was thereupon submitted to the voters at the election in November and carried by a substantial majority, thus becoming a part of the constitution. During the preëlection campaign it was warmly supported by Governor Smith and also by some of the leading men in the Republican party, including Charles E. Hughes, Elihu Root, and Nicholas Murray Butler. A standing example of the ineptitude of the long ballot as applied to state affairs was contained in the results of the last gubernatorial election in New York, whereby Honorable "Al" Smith was elected governor on the Democratic ticket, but the Republicans were successful in electing the subordinate state officials. We thus have an administration divided against itself politically and no complete party responsibility for the work of administration is possible under the circumstances.

The New York constitutional amendment provides for cutting down the number of elective state officials to four, namely, the governor, lieutenant-governor, comptroller and attorney-general. They are all to be elected for the same term of two years. The amendment abolishes a number of state officials, including those of secretary of state, state treasurer, state engineer and surveyor, superintendent of state prisons and others. The central and outstanding feature of the new plan is the grouping of all the administrative agencies of the state into twenty main divisions, to take the place of the approximately 180 existing departments, bureaus, and commissions, which now in many instances perform overlapping functions. The twenty departments provided for in the amendment are as follows: (1) executive, (2) audit and control, (3) taxation and finance, (4) law, (5) state, (6) public works, (7) architecture, (8) conservation, (9) agriculture and markets, (10) labor, (11) education, (12) health, (13) mental hygiene, (14) charities, (15) corrections, (16) public service, (17) banking, (18) insurance, (19) civil service, and (20) military and naval affairs.

The comptroller and attorney-general are to be the heads of the departments of audit and control, and of law respectively. The comptroller is to be purely an auditor, without other administrative functions. The heads of all the other departments are to be appointed by the governor, with the advice and consent of the senate, except that the commissioner of education is to be appointed by the Board of Regents of the State University and that the appointment of the head of the department of agriculture and markets is not specifically vested in the governor, but is to be made in such manner as the legislature may determine. No additional departments can be created, but the number of departments may be reduced through consolidation or abolition. In case new powers and functions should be undertaken, they are to be placed under one or more of the twenty departments. The legislature, however, may create temporary commissions to meet emergencies that may arise.

The New York constitutional amendment is not self-executing. It will be the duty of the legislature meeting in January, 1926, to pass the necessary laws to carry out its provisions, and it will then go into effect on July 1, 1926. Meanwhile an unofficial commission composed of prominent members of both parties and headed by Charles E. Hughes has been created by the Republican leaders of the legislature for the purpose of working out the plan whereby the amendment can become operative.

Reorganization in Minnesota.—The movement for administrative reorganization in Minnesota, which has been hanging fire for a decade, finally reached the stage of embodiment in legislation during the session of 1925. At the previous session in 1923 the legislature had created a committee of five members for the purpose of making an investigation of the various state administrative agencies and reporting to the next session of the legislature a plan for their reorganization along lines of greater efficiency and economy. The committee reported its findings and recommendations to the legislative session of 1925. Governor Christianson had been a member of the committee and in a message to the legislature strongly supported its work and recommendations. The committee report favored the adoption of a plan whereby there should be ten administrative departments and also an executive council consisting of the governor as chairman and the constitutional elective officers, namely, secretary of state, treasurer, auditor and attorney-general. Legislation to carry out the committee's recommendations was introduced in both houses, and, after considerable wrangling, was finally passed in somewhat altered form in April and went into effect on July 1, 1925.

The reorganization act as thus passed retains the executive council as originally recommended, and vests in it the powers of certain ex officio boards, such as the board of deposit, and the board of relief. Instead of ten departments, however, the act provides for thirteen departments, as follows: (1) administration and finance, (2) conservation, (3) dairy and food, (4) agriculture, (5) highways, (6) education, (7) health, (8) commerce, (9) labor and industry, (10) public institutions, (11) taxation, (12) rural credit, and (13) drainage and waters. A noteworthy feature of the plan is the predominant extent to which boards or commissions are retained at the head of these departments. Only four departments, namely, drainage and waters, dairy and food, agriculture, and highways, have as their heads single commissioners appointed by the governor. Each of the other nine departments is under the control or supervision of a board or commission.

Theoretically, at least, there would seem to be no sufficient reason why this difference in organization was adopted. It is true, however, that in some cases the bureaus or divisions within the multi-headed departments have single officers in charge and they together constitute the board or commission at the head of the department. The most important of the thirteen departments is the department of administration and finance, at the head of which is a commission, consisting of the heads of the three divisions into which the work of the department is divided, namely, the comptroller, the commissioner of the budget, and the commissioner of purchases. The Minnesota plan does not go as far toward a scientific reorganization as might be desired, but it is nevertheless a promising step in the right direction.

South Dakota.—In response to a message of recommendation sent by Governor Gunderson of South Dakota to the legislature of that state at its 1925 session, an act was passed which provides for a partial reorganization of the state administration. By this act nine administrative agencies were consolidated into a new department of finance and eighteen into a new department of agriculture. Each of these new departments is headed by a secretary who is appointed by the governor with the consent of the senate. The department of finance thus created is organized into four divisions, namely, audits and accounts, purchasing and printing, employment, and taxation. The department of agriculture is likewise organized into four divisions, namely, animal industry; markets, statistics and immigration; inspections; and game and fish. The state auditor, a constitutional elective officer, is ex officio head of the division of audits and accounts in the department of finance. The heads of all the other divisions in both of the new departments are appointed by the secretary of the department with the advice of the governor.

Creation of New Departments.—In spite of the advance made in New York, Minnesota, South Dakota and other states in the direction of the consolidation and abolition of useless boards, bureaus and agencies, the creation of new departments and administrative agencies continues in most states. Thus in Illinois, Governor Small, in his message to the legislature of 1925, recommended that, "in view of the increased volume of business in some of the departments incident to the great road construction and waterway building programs, and the ever-increasing activities in all departments," there should be created a department of waterways and a department to comprise the divisions of purchases and supplies and of printing. The activities of these divisions he held to be important because they "intermingle closely with those of all other departments." The legislature complied substantially with the governor's recommendation by amending the civil administrative code of 1917 so as to provide for the creation of a new code department to be known as the department of purchases and construction, which is to exercise the functions that, according to the governor's recommendation, should have been exercised by the two new departments whose creation he suggested. The legislature also amended the code so as to create the new department of conservation, to which is transferred the work of protecting fish, game and forests, formerly performed by the department of agriculture.

STATE JUDICIARY

By J. M. Mathews

Professor at the University of Illinois

Commercial Arbitration.—A few of the outstanding developments in this field may be briefly noted. Rapid progress has been made in commercial arbitration during the year, especially through the efforts of the Arbitration Society of America, in the establishment of tribunals for settling business and other disputes without recourse to the courts. In addition to New York and New Jersey, Massachusetts has now provided for commercial arbitration. It is stipulated that, in case the parties agree to accept arbitration in place of the usual court trial, the decisions of the arbitration tribunal shall be binding.

New York Reorganization.—In New York a proposed amendment to the judiciary article of the state constitution was submitted to the voters at the November, 1925, election. It is a long and complicated measure and embodies the result of ten years' study by members of the bar, of the legislature, of the state constitutional convention of 1915, and of the judiciary constitutional convention of 1921. In general it may be said to be intended to improve the organization, jurisdiction, and methods of procedure of the state and local courts. One of its primary objects is the lessening of delays in the administration of justice. One of its provisions is a requirement that the legislature shall provide for the compilation and publication annually of the civil and criminal judicial statistics of the state, a long-felt want. Another provision is that authorizing an appeal direct to the Court of Appeals in cases where the only question involved is the constitutionality of a statute, thus avoiding the useless delay and expense of a double appeal. The amendment also authorizes appellate courts, in case of reversal, to render final judgment rather than to remand the case to the lower court for a new trial, thereby also avoiding expense and delay. The amendment was approved at the polls in November by a substantial majority of the voters. A proposed amendment containing some provisions of a similar character has also been passed by the legislature of California.

State Judicial Councils.—The movement for the creation of state judicial councils with rule-making powers has made some progress during the year. To the three states—Ohio, Oregon and Massachusetts—already having such councils must now be added North Carolina, which passed a law creating such a body at the legislative session of 1925. The North Carolina act differs from those of the other states in that it creates a council consisting of the supreme court and superior court judges, together with the attorney-general and a member of the bar appointed by the governor from each judicial district. In California a proposed constitutional amendment creating a judicial council was passed by the legislature and will be submitted to the voters in November, 1926. It was proposed in the form of a constitutional amendment rather than embodied in a legislative act in order to avoid the danger of possible unconstitutionality arising from the wide scope of rule-making powers conferred on the council. These powers, however, were somewhat narrowed by the legislature in the form in which it passed the proposal. During the year the Pennsylvania Bar Association approved the report of its special committee appointed to consider the creation of a state judicial council, and it is expected that a bill embodying the plan will be introduced in the legislature of 1927.

Anti-Injunction Action.—The Illinois legislature of 1925 passed the anti-injunction bill which prohibits judges of any court of the state from granting injunctions restraining strikers from engaging in peaceful persuasion and "peaceful picketing" in labor disputes. In November the law was held unconstitutional by the superior court of Cook County in a decision finding members of the Retail Clerks' Union guilty of contempt of court for violation of an injunction against picketing. What attitude the supreme court will take toward the new anti-injunction bill still remains to be seen.

STATE FUNCTIONS

By J. M. Mathews

Professor at the University of Illinois

State Finance.—State expenditures are constantly increasing and many states are hard pushed to find adequate sources of revenue. The governors, in their messages to the legislatures of 1925, reveal in many instances their anxiety regarding a solution of this problem. A comparatively recent source of revenue which has spread rapidly is the gasoline tax of from one to five cents a gallon, which is now found in all but four states. During the first half of 1925 in the forty-four states having this tax about $60,000,000 in revenue was derived from it. This tax was most productive in California, yielding about $7,500,000 in the six months' period. In Wisconsin, a large part of the revenue for state purposes is derived from the income and inheritance taxes. These taxes proved so productive that it was announced in October that Wisconsin would levy no state property taxes during the year. On the other hand, Florida has adopted constitutional provisions prohibiting income and inheritance taxes as an obvious bid for wealthy residents. Oregon has also abandoned the income tax. In Illinois, the legislature of 1925 passed a resolution to submit to popular referendum a proposed amendment to the state constitution enabling the legislature, by a two-thirds vote, to levy taxes upon incomes, to grant exemptions from taxation by general law and to classify property for purposes of taxation. It is required that all real estate shall be in one class, except that mineral land and land devoted to reforestation may be in different classes. The proposed amendment will come up for popular vote in November, 1926.

Budget.—Extension of the executive budget has made some progress during the year. Governor Smith of New York was balked in his efforts to secure the adoption of such a system in the legislative session of 1925, but is continuing his efforts in this direction. The introduction of such a system or the improvement and strengthening of existing budgetary control is urged in their messages to the 1925 legislatures by the governors of Washington, South Dakota, North Carolina, Kansas, Montana, Rhode Island, Missouri and West Virginia. In response to these messages laws providing for the executive budget system were passed in Washington and North Carolina, and better methods of fiscal control were adopted in Minnesota and South Dakota in connection with their administrative reorganizations. In some states the existing budget system is not as effective as it might be because it is not applied to all public agencies of the state. Thus, in New Jersey the Bright Investigating Committee reported in November that the state's expenditures during the fiscal year ending June 30, 1925, were about $66,000,000, of which only about one-third was subject to legislative review through the budget system. The Committee pointed out that some departments are operating through bond issues and others through departmental receipts. Governor Silzer of New Jersey, in his message to the legislature of 1925, recommended that all state funds be paid into the treasury, as is now required by law in many states. Substantially the same recommendation was made by the governors of Utah and Colorado, it being pointed out that, in the latter state, only about one-fourth of the state expenditures consist of appropriations from the general funds. Continuing appropriations were condemned by the governors of Maine, Idaho and Tennessee.

Increase in state indebtedness through bond issues has recently proceeded at a rapid rate. As a rule, these bond issues are floated for the purpose of building permanent improvements, such as a system of hard roads. Thus, in November, 1924, the voters of Illinois approved a $100,000,000 bond issue for this purpose. At the same time the voters of New York approved a $15,000,000 bond issue for a system of state parks. At the election of November, 1925, the voters of New York passed on two proposed bond issues. One was for $300,000,000 to eliminate railroad grade crossings, and provided that 50 per cent. of the cost is to be borne by the railroads, 25 per cent. by the state government, and 25 per cent. by the particular city, town or village. The other proposed bond issue was one of $100,000,000 for financing permanent state improvements at the rate of $10,000,000 a year for the next ten years. The particular improvements for which the money is to be used are not exactly specified in the amendment, and this was one ground of objection to it. It is expected, however, that it will be used principally in the construction of new buildings at the various state institutions, which are now badly overcrowded, but it may also be used for building bridges and other purposes. This latter amendment was strongly opposed on the ground that it represented an abandonment of the safe and sane pay-as-you-go policy. On the other hand, the proposal was supported on the ground that it would enable the state to adopt a constructive and far-sighted policy in connection with the development of the state institutions so as to make them adequate to meet the growing needs. At the November election both of the proposed bond issues were approved by the voters.

Other State Functions.—States and municipalities not infrequently engage in the operation of public utilities, but it seems that constitutional objection may be raised to the entrance of the state into such a business as the buying and selling of coal or gasoline for the purpose of keeping down the price. South Dakota engaged in the gasoline business for this purpose. The White Eagle Refining Company sought an injunction to restrain the state from continuing in the business. The injunction was granted and, in October, the supreme court of South Dakota held unconstitutional the law under which such participation was attempted to be authorized.

The Kansas Industrial Court has again received a hard blow from the Supreme Court of the United States. The Industrial Court was established in 1920 for the purpose of looking out for the interests of the public—the party of the third part—in disputes between capital and labor. In 1923 the Supreme Court of the United States, in the Wolff Packing Company case, held that the Industrial Court had no power to fix the wages of persons employed in industry. In April, 1925, it held that the Industrial Court could not fix the hours and working conditions of employees, nor could the state provide for compulsory arbitration in fixing of either wages or conditions of labor. Such a system, it was held, infringes the liberty of contract and rights of property guaranteed by the due process of law clause of the Fourteenth Amendment.

Minimum wage laws have recently had hard sledding in the courts. In October, the Arizona minimum wage law for women was declared unconstitutional by the Supreme Court of the United States.

Two decisions of general interest were rendered during the year regarding the extent of the power of the state in maintaining and regulating systems of education. The legislature of Oregon passed an act requiring children between the ages of eight and sixteen, with certain exceptions, to attend the public schools. In June the act was declared unconstitutional by the Supreme Court of the United States on the ground that it was an unreasonable interference with "the liberty of parents and guardians to direct the upbringing of children under their control" and would therefore deprive them of liberty without due process. (Pierce v. Society of the Sisters of the Holy Names, 45 Sup. Ct. Rep., 571.) The court recognized, however, that the state may regulate private schools and may require in them the study of certain subjects, such as those essential to good citizenship. The second decision was that in the Scopes case in Tennessee, in which the state law prohibiting the teaching of evolution in the public schools was upheld in the lower court.

During the year the organization of better means for the enforcement of law received some attention. A state police force was created in Rhode Island along the lines of the Pennsylvania and New York forces. In Illinois, the general police powers of the state highway maintenance patrol were extended. The efforts of many of the states, however, in coöperating with the National Government in the enforcement of prohibition seemed unavailing to cope with the widespread violation of the national prohibition law.

CENTRALIZATION OF STATE AUTHORITY

By Roger H. Wells
Assistant Professor of Politics, Bryn Mawr College

During 1925, state authority was not materially enlarged at the expense of local government. Finance, education, health, and public utilities continued to be important fields for the extension of state supervision and control.

Finance.—In Ohio, the legislature passed four measures designed to relieve local taxing authorities from some of the hardships imposed by the Smith one per cent. tax limit law. (See pp. 3 ff., 345 ff., 371 ff., and 422 ff., Laws of 1925.) These measures sanctioned an emergency tax levy to pay deficiencies in operating revenues for the current fiscal year, exempted from the tax limit all taxes levied to meet the principal and interest of debts incurred by popular vote, granted to all local taxing authorities the privilege of submitting to the voters the question of additional levies outside of the existing tax limits, and allowed cities and villages under home rule charters to be entirely free from the Smith law, provided they incorporated within their charters provisions for a budget system and for some kind of tax limitation. On the other hand, a constitutional amendment, which forbade borrowing for current expenses or for improvements having an estimated usefulness of less than five years, and which required that no bonds should run longer than the probable period of usefulness of the assets acquired, was defeated by the voters at the election of November 3, 1925. This amendment merely sought to write into the constitution restrictions already embodied in an existing debt statute.

The drastic Indiana plan of central supervision of local budgets and bond issues found champions in New Jersey, Minnesota, and North Dakota but the legislatures of those states were unwilling to adopt that plan.

Education.—State subventions continued to be a favorite method of increasing state control over local school systems. Thus, in Georgia, a recent statute (Ch. 395, Laws of 1925), requires, as one of the prerequisites to receiving state aid, that all local public school boards submit annual budgets to the state department of education on forms and according to the classification prescribed by that department. Expenditures called for in the budget must not exceed the estimated income as shown in the budget.

Health.—Water supply and sewage disposal tend to pass more and more under central control. The Connecticut legislature created a state water commission (Ch. 143, Laws of 1925), empowered to command municipal or private corporations to install systems designed to "eliminate, reduce, or control water pollution." This act extends the authority formerly exercised by the state department of health.

Legislation of Delaware in 1925 conferred somewhat similar powers on the state board of health. Michigan took a further step in extending state supervision over public water supplies. By an act of 1925, bonds for the construction of sewage disposal plants may be ordered to be issued by the state department of health or by the courts.

Michigan likewise increased the amount of state aid to county tuberculosis sanitoria and at the same time raised the standards necessary for such institutions in order to receive such state aid.

Public Utilities.—A considerable number of states (*e. g.*, California, Iowa, Maine, Minnesota, North Carolina, Pennsylvania, and Vermont), passed laws extending the control of state public utilities commissions over motor buses. So far as local governments are concerned, the general effect of these laws is to restrict the power of local authorities to regulate motor buses.

V. STATE AND COUNTY GOVERNMENT

COUNTY GOVERNMENT

By Roger H. Wells
Assistant Professor of Politics, Bryn Mawr College

Failure of Special Charters in New York.—County government continued to be the subject of considerable discussion during 1925 but the positive accomplishments were few in number. The new charters proposed for Westchester and Nassau Counties, New York, were defeated by the voters in the November elections. These charters were made possible by a constitutional amendment, adopted in 1921, which permitted the legislature, subject to local referendum, to provide special types of government for the two counties in question—counties which, on account of their large populations and nearness to New York City, had found the prevailing form of county government particularly unsatisfactory. The rejected charters were framed by nonpartisan commissions and were then enacted by the legislature. (Nassau County charter, enacted as Ch. 863, Laws of 1923, amended by Chs. 451, 452, 546, Laws of 1925; Westchester County charter enacted as Ch. 587, Laws of 1925.)

Westchester Plan.—The main features embodied in the Westchester County charter are as follows:—The board of supervisors as at present organized is continued but it no longer exercises administrative powers and its legislative authority is somewhat restricted. An elective chief executive, chosen for a four year term, is provided in the form of a county president, an officer analogous to a mayor, and the administrative functions are divided among eight enumerated departments. Six of the department heads are appointed by the president without the confirmation of the board of supervisors and hold office at his pleasure. The six departments thus placed under the control of the president are welfare, headed by the commissioner of welfare who was formerly elected; law, headed by the county attorney who was formerly appointed by the board of supervisors; public works and buildings, engineering, weights and measures, and health.

The elective offices of treasurer and comptroller are abolished and their functions are taken over by an elective commissioner of finance. The elective coroners are replaced by a medical examiner appointed by the board of supervisors. The constitutional offices of sheriff, county clerk, district attorney, county judge, and surrogate continue, as before, to be filled by election. Borrowing a leaf from New York city governments, a board of estimate is established to consist of the president, vice president (elected for four years and presiding over the board of supervisors), and commissioner of finance.

This board prepares the budget from estimates presented to the county president and submits it to the board of supervisors whose only power over appropriations is limited to striking out or reducing items in the budget and even this power is denied in the case of salary items. The board of estimate also fixes salaries except those fixed by law, creates or abolishes positions in all departments, controls the purchase of supplies and the letting of contracts, and has broad investigative authority. The Nassau County charter is similar in principle to that of Westchester but there are certain differences in organization which space will not permit to mention here. Though defeated, these charters represent one of the most important attempts to reform county government in the eastern states.

The Butte-Silver Bow Charter was amended by the Montana legislature of 1925. This charter was the outcome of a constitutional amendment adopted in 1922 which empowered the legislature, subject to local referendum, to provide new forms of government for counties or consolidated cities and counties.

As originally drafted by Dr. A. R. Hatton, the National Municipal League's charter consultant, the charter bill permitted the city of Butte and the county of Silver Bow to consolidate under a commission-manager type of government. In this form, it was passed by the legislature (Ch. 160, Laws of 1923), but was defeated when submitted to a referendum vote in 1924. The recent amendments (Ch. 44, Laws of 1925), weaken the power of the manager and lengthen the ballot by providing that the city and county attorney, the assessor, and the sheriff shall be elected and not appointed. The amended charter will again be submitted to a referendum if 1,500 voters so petition.

County - Manager Government.—The County-Manager system was discussed in a number of legislatures, notably Missouri and Ohio, but no definite action resulted. In Ohio, city-county consolidation and county home rule likewise went down to defeat.

Oregon Commission.—The Oregon legislature authorized (Ch. 217, Laws of 1925), the creation of a commission to study and report upon the possible simplification of local government in Multnomah County (which contains the City of Portland). This commission is to report to the governor by November, 1926, and also to the 1927 legislature.

Utah (Ch. 25, Laws of 1925) directs that each county shall adopt a budget system as outlined in the act, but makes no provision for central supervision of such county budgets.

POPULAR GOVERNMENT

By Roger H. Wells

Assistant Professor of Politics, Bryn Mawr College

Elections.—A number of changes in primary and election laws were made in 1925. Oklahoma introduced the preferential ballot in primary elections (Ch. 29, Laws of 1925). Arizona (Ch. 75, Laws of 1925) and Vermont (Ch. 5, Laws of 1925) extended the privilege of absent-voting to persons kept away from the polls because of illness or physical disability. Utah (Ch. 76, Laws of 1925) provided for registration of voters who expect to be absent on the regular days of registration. The same state also established a system of double election boards so that one board may begin to count the votes before the polls are closed (Ch. 34, Laws of 1925). Idaho (Ch. 96, Laws of 1925) introduced a system of permanent registration.

Direct Primary.—The status of the direct primary remained the same during 1925. At present, there are mandatory direct primary laws in thirty-nine states, and optional laws in six states. In the case of the former, some or all of the candidates for state or local elective offices must be nominated as the direct primary act requires; while in the case of the latter, each political party through its appropriate committees, may decide whether or not the direct primary law shall be adopted and used by the party in nominating its candidates. Connecticut, New Mexico, and Rhode Island are the only states in which nominations are made exclusively by methods other than the direct primary. The presidential preference primary now exists in some form in twenty-two states.

Initiative, Referendum, and Recall.—No changes were made in these institutions during 1925. The statutory initiative and referendum at present exist in eighteen states,—South Dakota, Utah, Oregon, Nevada, Montana, Oklahoma, Maine, Missouri, Michigan, Arkansas, Colorado, California, Arizona, Nebraska, Ohio, Washington, North Dakota, and Massachusetts. (The Mississippi initiative and referendum provisions were declared void by the state supreme court in 1922. For the status of the constitutional initiative, see Table III, State Constitutions, *supra.*) Maryland and New Mexico have the direct popular referendum but not the initiative. The recall is found in ten states,—Oregon, California, Arizona, Colorado, Nevada, Washington, Michigan, Kansas, Louisiana, and North Dakota. In Washington, Michigan, and Louisiana, the recall does not apply to judges. In Kansas, appointive as well as elective officers are subject to the recall.

Measures Voted on in State Elections.—The following is a brief digest of the measures submitted to the state electorates during 1925.

Arizona.—Submitted Sept. 29.

Constitutional amendment, amending Art. XVIII, Sec. 8, providing for a more adequate system of workmen's compensation. Proposed by the legislature. Adopted.

Maine.—Submitted Sept. 14.

Constitutional amendment, amending Art. IX, Sec. 17, authorizing the issuing of bonds not to exceed three million dollars to be used for the purpose of building a bridge across the Kennebec River. Adopted, 54,107 for, 8,228 against.

Constitutional amendment, amending Art. IX, Sec. 17, providing for an increase in the amount of state bonds that may be issued for the purpose of building state highways and interstate, intrastate, and international bridges. Adopted, 49,821 for, 10,332 against.

Act incorporating Dexter P. Cooper, Incorporated, for the purpose of developing and utilizing the power of the tides in the Bay of Fundy. (Bay of Fundy hydroelectric power project.) Referendum ordered by legislature. Adopted, 53,547 for, 7,220 against.

Submitted Dec. 7.

Act relating to standard time (forbidding towns and municipalities to establish "daylight saving" time). Referendum by petition. Adopted.

Act to define certain grades of milk offered for sale within the state. Referendum by petition. Rejected.

New York.—Submitted Nov. 3.

Constitutional amendment, amending Art. VII by adding Sec. 15, authorizing creation of a debt not exceeding ten million dollars annually for ten years for purpose of constructing buildings at the various state institutions. Adopted, 960,385 for, 937,990 against.

Constitutional amendment, amending Art. VII by adding Sec. 14, authorizing creation of a debt not exceeding three hundred million dollars for purpose of eliminating railroad grade crossings. Adopted, 1,032,109 for, 859,702 against.

Constitutional amendment, amending Art. V and Art. VIII, Sec. 11, providing for administrative reorganization and shorter ballot. (See *State Administration, supra.*) Adopted, 1,048,087 for, 775,768 against.

Constitutional amendment, amending Art. VI, relating to the organization of the judicial system of the state. (See *State Courts, supra.*) Adopted. 1,090,632 for, 711,018 against.

Ohio.—Submitted Nov. 3.

Constitutional amendment, amending Art. VIII, Sec. 13, relative to the incurring of indebtedness by political subdivisions. (See *Centralization of State Authority, supra.*) Proposed by legislature. Rejected, 450,218 for, 535,251 against.

Constitutional amendment, amending Art. XII, Sec. 2, authorizing the legislature to tax intangible property without regard to the uniformity requirement of the constitution. Proposed by legislature. Rejected, 435,944 for, 501,221 against.

Constitutional amendment, amending Art. III, Sec. 2 and Art. X, Sec. 2, providing for a four-year term of office for elective state and county officials. Proposed by legislature. Rejected, 325,541 for, 543,183 against.

STATE AND COUNTY STATISTICS

DIVISION VI
MUNICIPAL GOVERNMENT

EXPANSION OF CITIES

By Robert T. Crane
Professor of Political Science, University of Michigan

City growth is a subject which cannot be handled in precise terms for a given year. Annual statistics in this field are largely lacking, are for the most part merely estimates, often do not coincide with the calendar year, and are usually available only long after its close. Owing to this lack of statistical data, any generalization on municipal expansion in 1925 will probably apply as well to other years near that date.

Estimates of Population.—Population figures issued by the Bureau of the Census as of July 1 each year for individual cities are avowedly estimates. They are calculated mechanically by adding each year one-tenth of the increase during the preceding census decade except for additions allowed to cities that have annexed territory. From 1910 to 1920, the rate of increase of the total city population of the United States was on the average 2.5 per cent. yearly. When the Bureau sees reason to believe that the figures resulting from application to a particular city of its last decennial rate are materially inaccurate, they are omitted. When the results of a local census are available, these are substituted by the Bureau. As a rule, the estimates are conservative, since growth has shown constant if slight acceleration.

Effect of Immigration Laws.—How far the restriction of immigration into the United States is affecting the growth of cities must remain problematical until the actual count of population in 1930. The present wave of immigration from Mexico and from Canada would indicate that the restriction on other countries has made itself strongly felt in 1925; yet in view of the large proportion of growth normally accruing through birth within the cities and through migration from rural districts, which rests upon fundamental causes involved in the modern industrial system and exerting a very constant force of attraction, decreased immigration from abroad seems likely to lower only the rate of acceleration from one census period to another and not to lower the absolute rate established during the decade in which occurred the World War. The mechanical method of adding each year one-tenth of the gain during the preceding decade gives results for 1925 that are probably even nearer the mark than usual.

Total Urban Population.—It is significant, therefore, that the government rule, if applied to the aggregate urban population of the United States, would give an estimated increase during 1925 of some 6,700,000 souls, raising the total from 54,304,603 in 1920 to approximately 61,000,000 in 1925. It is to be noted, further, that these figures include only the inhabitants of incorporated places and omit that part of the urbanized population which overflows the legal boundaries. Nowhere is there, or has there ever been, so huge an urban population in one country.

Rank of Cities.—A special census in Detroit gives that city a population of 1,242,044, and makes it the fourth in the United States to pass officially the million mark. Cleveland has almost reached a million. There have been seven additions to the so-called great cities—*i.e.*, those with a population of 100,000. These are Flint, Michigan; Tulsa, Oklahoma; Canton, Ohio; El Paso, Texas; Tacoma, Washington; Lynn, Massachusetts, and Utica, New York. They raise the total of this class from sixty-eight in 1920 to seventy-five. This is three times the whole number of great cities in all the western or European world when the American Union was founded. Nine other cities are close to this class; four of these are so doubtful that the Bureau of the Census has published no estimates of their population.

The urban character of the United States is undoubtedly more marked in 1925 than in any previous year. Each successive census has shown in the cities a larger proportion of the total population of the country. From 3 per cent. in 1790, city dwellers had increased at the time of the last census to 51.4 per cent., so that by 1920 the United States had acquired a predominantly urban civilization. The rate of this increase has varied only within one or two per cent. from census to census, and there is no reason to believe that it has fallen measurably below the slightly more than one-half of 1 per cent. shown during the last decade. It may therefore be conservatively estimated that in 1925 54 per cent. of the population of the country is resident in cities as against 46 per cent. in rural districts. It is to be noted, also, that the urban character of the United States is heightened by the hundreds of thousands of people who, though technically resident in the country areas, do little more than sleep there, and spend a large proportion of their time, often daily, in occupations and interests within the cities.

Changes in corporate area are poorly reported. Even the fact that a change has occurred is difficult to run down, the more so that annexation is now frequently left to local plebiscites without the necessity of action by the state legislature in individual cases.

During the last census decade, the areas incorporated in cities increased at the rate of 2 per cent. per annum. This is a little slower than the population movement. The arbitrary factor in annexation frees this rate to some extent from the steadying influence imposed on the population rate by the operation of such continuous causes as the demands of the modern industrial system. It is therefore a less reliable basis for estimates. If applied, it would indicate an extension in 1925 of 65,000 acres, or a total area at this time of 3,700,000 acres, or 5,800 square miles. Some sixty million people live on these six thousand square miles, 54 per cent. of our population on one-fifth of 1 per cent. of our territory, the most stupendous pyramiding of population the world has ever seen.

Metropolitan Districts.—These statistics of incorporated places do not even yet give a complete picture of the extent to which the population of the country has become agglomerated in centers. There are many clusters of incorporated places, for which the figures appear separately, but which yet constitute continuous urban areas. There are in the United States twenty-nine of these metropolitan districts with an aggregate population of as many millions; or, disregarding legal boundaries and looking only at the fact of urbanization, twenty-nine cities averaging a million inhabitants.

Effects on Government.—City expansion is the core of the great problem of the modern city. The massing of huge populations on small areas with the attendant congestion, the loosening of family and neighborly interest, intimacy and control, the lack of habituation of a large part of the people to urban life, the absence of opportunity for the indulgence in customary occupations of leisure, the great divergencies of wealth which separate city dwellers, the added menaces to health, to life, and to property, the extraordinary demands of traffic and of transportation,—create unprecedented physical and social problems. Thus there fall upon the governments of the cities tasks of unparalleled and ever-growing complexity and magnitude, which call for the frequent assumption of new burdens and for the elaboration of organization. Expansion not only of population and of area, then, but also of government both in its activities and in its organization, characterizes the American city of to-day.

Metropolitan Functions.—As a consequence of this steady pressure of demand for increased services, city government has attained a degree of development in 1925 never before reached. Particular cities that have not before exercised such functions are now undertaking, one the collection of garbage or of other wastes or the incineration or other reduction of refuse or sewerage, another the supply of gas or electricity, another the care of the sick through public nurses or the medical examination of school children, and yet another the systematic planning of city development or zoning. Many cities have recently established camping grounds to accommodate automobile tourists. A number are contemplating public aviation fields. One, at least, has undertaken permanently the sale of coal and of gasoline in order to hold prices at reasonable levels. The expansion of old functions goes incessantly on together with the addition of new ones adopted from other communities or entirely novel. The cumulative effect of these changes is enormous.

City Finance.—All of this growth, of population, area, and governmental activity, is most faithfully reflected by the financial operations of cities. A century ago New York City had just passed the 100,000 population mark. At that time it expended a dollar per capita; in 1925 this figure had grown to $67. A century ago its annual budget was $100,000; in 1925 it was $400,000,000. The value of money has changed, indeed, but the differences in these figures is essentially due to growth; and what is true of New York City is true in progressively declining measure of the smaller cities.

It has been well said that the growth of the cities is the most remarkable social phenomenon, and constitutes the greatest social problem, of the modern age.

ZONING AND CITY PLANNING

By Robert T. Crane
Professor of Political Science, University of Michigan

CITY PLANNING

City planning maintained in 1925 the steady progress of recent years. The name, indeed, is hardly longer appropriate; for on the one hand planning is being undertaken by communities too small to be termed urban; and on the other has extended far beyond the limits of even the largest cities. The National Conference on City Planning reported some 300 commissions in existence at the beginning of the year, most of which were active, although it must be recognized that many others have only a formal existence. Numerous planning reports have been published during the year. Mandatory provisions for the establishment of a city plan have been written into virtually every new charter. Popular support has steadily grown. Significant backing has come from various organized national groups, especially the real estate dealers and chambers of commerce. The Department of Commerce at Washington through the establishment of the Division of Housing and Building, and of the City Planning Committee of the National Conference on Street and Highway Safety called by Secretary Hoover in December, 1924, has done much to promote city planning during the year.

Basis.—A city plan is a program of studied and permanent development of the physical conditions of community life in the interest of efficiency, of health, of convenience, and of beauty. It may cover the whole physical development of the community whether development is by private or by governmental action, whether development is of private or of public property. For the regulation of the action of individual property owners, there is a recognized special name—zoning. Two principal divisions, therefore, of city planning must be distinguished: city planning in a narrow sense which relates to the activities of public and semi-public agencies, and zoning, which relates to the activities of individuals. City planning in this narrower sense, is of course often very far from complete. Its most common features are provisions for streets, including the location on, above, or below them, of the various utilities and agencies of transportation, and the routing of traffic; for terminals, including ports, and railroad rights-of-way and their connections; for parks and boulevards and other areas of recreation; and for the grouping and style of public buildings. The city plan, even though adopted by an official planning commission, is usually without legally coercive authority. It is advisory only and may be ignored by other city officers. Containing often an extensive and expensive program of development, the plan is usually designed to cover a number of years; as conditions can be foreseen with less and less accuracy in the future, the plan must have a degree of flexibility corresponding to the period which it is designed to cover.

Harrisburg.—In 1925, the plan prepared for Harrisburg, Penna., offers an excellent illustration of a proposed street lay-out based on traffic studies. It provides for discontinuance of the present system of routing all trolley lines through one square in the center of the business district; for re-routing these lines around the edge of this district; for abolishing within it the parking of automobiles; for the widening and extension of several streets to provide more adequate approaches and thoroughfares; and for the opening of one new street for a short distance through blocks on which buildings now stand. Its execution is spread over a period of ten years.

Cincinnati.—A plan of a general type issued in 1925, and the outstanding feature of city planning in this year, is that of Cincinnati, Ohio. This is noteworthy as the first plan to be officially adopted in a large city. State law and city charter alike give to the planning commission the power to fix the location, size, and character of all public buildings and areas, the lay-out of all utilities and public services, and the development of all streets and other means of circulation. This power the commission has exercised, and the plan thereby acquires exceptional legal authority. No deviation by other authorities of the city is permitted by law unless approved by the planning commission; or unless, upon its disapproval by the commission, it is authorized by two-thirds of the full membership of the city council after a public hearing, as provided by the charter, and, as stipulated by the state law, has in addition the approval of the department head concerned. This last provision adds materially to the authority of the commission, for it has five *ex officio* members out of seven—including the mayor, the director of public service, and the three members of the park board, officials who represent the departments most likely to be affected by the plan. The *ex officio* membership of the commission is obviously an important factor. The plan is noteworthy also on account of the unusual strength of its financial provisions. It is on this side that city planning has probably in general been weakest. The Cincinnati plan covers a period of fifty years, and has distributed the work to be done in detail over five-year periods with a fairly even spreading of the cost. The methods of financing have received very careful attention. The plan embraces a three-mile belt around the city in addition to the corporate area,—a growing practice. It thus extends into Kentucky, where it has of course no authority. The situation in the legal belt within Ohio is not clear. Apparently the authorities outside the city cannot be compelled to execute the plan, nor on the other hand, under the law can they act in disregard of it.

The plan includes zoning already effective since April, 1924. It covers belt lines connecting railways, routing of through freight around the city, systematized traffic regulation, development of the waterfront for both recreation and utility, barge canals and basins, reclamation, parks, and playgrounds, schools, and other public properties. The document is a bulky one of some 125,000 words with numerous maps and other illustrations. Lengthy treatment is given all subjects covered by the adopted regulations. The plan, on which the City Planning Commission has worked for three years with the aid of the Technical Advisory Corporation has been framed with the collaboration and approval of every city department and every public utility affected by it; and it has very wide public support, its preparation having been initiated and financed by the United City Planning Association, which is composed of representatives of thirty important organizations of the city.

Regional Planning.—Planning has passed from the city into the region. It now embraces in a single program as many as three score neighboring municipalities. Work is proceeding steadily in the Boston and New York Regions. In the Chicago area, in addition to the formulation of a new central plan, an effort is being made to bring together immediately the plans that already exist in many of the communities included in this region. The Niagara Falls Region and the Connecticut Valley Region have both received state legislative recognition. A committee has been formed to promote planning for the area around Washington, D. C. The most important step in this direction taken in 1925, however, centers in San Francisco. After preliminary work had been done by the city planning section of the Commonwealth Club of that city, the Regional Plan Association was organized. This body is composed of cities, counties, civic organizations, and individuals. It is financed entirely by fees and contributions. It intends to develop a comprehensive plan for the major portion of nine counties, and to coördinate the present planning activities of nearly sixty municipalities. The region extends fifty miles to the north and as many to the south of San Francisco, and thirty miles to the east beyond San Francisco Bay. The total area is 4,000 square miles, with a population of a million and a half. Organization has been completed and surveys are under way. The plan will embrace port developments; highways; air, rail, and water transportation and terminals; rapid transit connections; bay protection from sewerage and refuse; flood control; water supply; and regional zoning.

Another type of planning is narrowly limited in scope. This is well represented in 1925 by the plan for tying the War Memorial recently erected in Baltimore, Md., to the city hall and other public buildings by a parked and terraced square flanked by façades of uniform height and similar design and material.

City planning has received endorsement by legislative action in twenty-four states. In several of them, similar recognition has been given to county and regional planning.

ZONING

Expansion of the System.—The zoning of cities has proceeded more rapidly throughout the United States in 1925 than ever before. Figures compiled by the Division of Building and Housing of the Department of Commerce and Labor at Washington as of July 1, show 366 zoned municipalities with an aggregate population of 26,000,000. The contrast with 48 cities and 11,000,000 population in September, 1921, indicates both a seven-fold increase in the number of zoned municipalities within the short period of four years, and an addition of 130 per cent. in population. The relatively small increase of population in comparison with the number of places is due to the extension of the movement to smaller communities with the zoning of virtually all of the great cities. A number of villages have been zoned during the past year. Forty-six places of all classes were zoned during the first six months of 1925,—33 of less than 25,000 population, 10 of 25,000 to 100,000, and 3 of over 100,000—

Denver, Colo.; Hartford, Conn., and New Bedford, Mass. Another city of 100,000, Duluth, Minn., was added to the list in October. Incomplete reports since July 1 indicate a total of some 400 zoned municipalities of all classes by the end of the year, and the number of people living within zoned areas to be approximately one-half the whole urban population of the United States. Many places report ordinances under way. Advocates of zoning are particularly active in Massachusetts, New York, Pennsylvania, Connecticut, and Indiana. At the beginning of the year Pennsylvania had 72 zoned muncipalities, New York, 56; California, 38; Illinois, 36; Massachusetts, 24; Ohio, 21.

Statutes.—State-wide enabling acts granting to municipalities the right to zone have been passed or put into effect during the year by Arizona, Connecticut, Florida, Idaho, Maine, New Hampshire, and Utah. The model state zoning enabling act prepared by the advisory committee on zoning of the Department of Commerce is in general closely followed by the new state legislation. Thirty-seven of the forty-eight states, therefore, now authorize zoning. The Maine act covers only cities of over 35,000 population, and that of Idaho only cities of the first class. New York by an amendment to its statute has authorized the regulation of the density of population. Minnesota passed an enabling act for the establishment of residential districts by eminent domain. A South Dakota law authorized owners of real property to enter into zoning agreements.

Extent.—Zoning has not in all cases been comprehensive. Complete zoning regulates the use of land, the use, height and area of buildings, and the density of population. Generally, the use, height, and area of buildings have been regulated; but in about two-fifths of the municipalities, regulation is attempted only of use, or of use and height, or of use and area.

Obstacles to the extension of zoning have been encountered as usual in the courts rather than in the legislative bodies. Zoning depends upon a grant of police power by the state legislature to the city. The legislature can grant only power which it itself possesses; and the police power in particular is carefully limited by the courts under the due process clauses to protect the individual against deprivation of property without compensation. Zoning must in general rest on considerations of health, safety, morals, or general welfare—a term which the courts have studiously refrained from defining. Zoning, also, must not be arbitrary; that is to say, it must be flexible allowing for reasonable variances, as where a line between two districts runs through an individual property. State legislation granting to municipalities the power to zone, has therefore almost invariably been held constitutional, as indeed have usually the local ordinances enacted under their authority. It is in their application to specific properties that the provisions of these laws have so frequently been declared unconstitutional by the courts.

New Jersey Test Cases.—Interest and controversy have centered in 1925 largely on the decisions of the courts of New Jersey. Although zoning has not been held unconstitutional in this state, construction and use have been permitted in case after case in derogation of ordinances and decisions of zoning officials. Most of the cases have followed the precedent set in 1924 in the Nutley case in which the erection of a grocery was permitted in an area restricted to residences. The courts have permitted construction in 1925 contrary to ordinances because of lack of any existing development of the contiguous property, in one case an area of five blocks, and in another of several hundred feet; the construction of business buildings, and their use for manufacturing, in residential areas and in contravention of established building lines, and of garages in a residential district where the nearest dwelling was 150 feet away. Writs of mandamus, also, have been issued without compelling the aggrieved party to resort to the boards of adjustment recently established by an amendment to the state law to hear appeals from the decisions of zoning officials. On the other hand, in one case denial of a permit for erection of a garage within ten feet of a residence was upheld as "quite within the police power," and in another a mandamus was refused because the remedy of appeal to a board of adjustment had not been exhausted. An analysis of decisions rendered during the year indicates that the lower courts in New Jersey are not in accord on the question whether it is proper any longer to issue writs of mandamus to override denials of building permits by zoning officials or whether such denials may be brought before the courts only on writs of certiorari after unsuccessful appeals to boards of adjustment. The point is important, for as Edward M. Bassett has noted in an admirable article (Fundamentals of American Zoning, American City, 23: 178-181, Aug., 1925) in states in which writs of mandamus are employed zoning ordinances are being constantly undermined, and in those in which cases come before the courts only from reviewing boards on certiorari zoning is being constantly more firmly established. A decision is awaited from the supreme court of New Jersey on this point. It appears also from recent cases that it is the regulation of use that results so often in invalidation, and that other regulation is not held invalid.

Maryland and Massachusetts.—In Maryland, a decision early in the year made it apparent that the Baltimore zoning ordinance would not be upheld. The court said that the ordinance worked a deprivation of property without compensation in forbidding the conduct of a tailoring establishment in a residential district and bore no substantial relation to the health, morals, welfare or comfort of the community. Although this statement was obiter, the case being decided on other grounds, and was countered by a strong dissent, it seemed conclusive as to the attitude of the court. An interim ordinance hastily passed, pending new legislation or constitutional amendment, has, nevertheless, been since upheld by the court, and the situation is now regarded as satisfactory by proponents of zoning. The courts of Massachusetts have steadily led the way to a broader conception of the police power giving fuller scope to regulation under zoning ordinances.

Progress.—On the whole, the year 1925 has seen the judicial view, properly conservative in this matter, progressing about as rapidly as public opinion has been convinced that community control is reconcilable with individual property rights. The chief justice of New Jersey has recently so expressed himself as to lead to the anticipation of some change in the attitude of the judiciary of that state. The limitations of zoning to the basis of health, safety, morals, and welfare, of the community, has indeed not been removed; and esthetics remain barred, yet even here the possibility of a less rigorous judiciary interpretation of the law has been voiced by at least one judge.

Official planning of undeveloped areas has been more widely undertaken during the year; but adequate legal means of enforcing compliance by property owners are still lacking. A statute employing the police power for this purpose has been proposed and drafted by Edward M. Bassett and Frank B. Williams.

Recent literature of value in the fields of city planning and zoning includes:

ORGANIZATIONS FOR STUDY OF CITY GOVERNMENT

By Clinton Rogers Woodruff

Honorary Secretary of the National Municipal League

National Municipal League and the American Civic Association held their annual meetings in Pittsburgh, November 18 and 19 in conjunction with the National Association of Civic Secretaries, Governmental Research Conference, Proportional Representation League, Pennsylvania Civil Service Association as the guests of the Civic Club of Allegheny County on the occasion of its thirtieth anniversary. One of the distinguishing features of the meetings was the presentation of a dramatic masque, entitled "The Smith," embodying a graphic presentation of the development of civic affairs during the past generation. "Influencing public opinion," "planning and governing metropolitan regions" and "beauty in American life" were the outstanding topics of discussion.

After having held the presidency of the American Civic Association for over twenty years, Dr. J. Horace McFarland of Harrisburg has resigned on account of impaired health. Frederick A. Delano, to whom may be credited a long list of civic accomplishments, was elected to succeed Dr. McFarland as president of the Association. Frank L. Polk was reëlected president of the League, the Secretary of which is Dr. Harold W. Dodds, 261 Broadway, New York. The Secretary of the Association is Miss Harlean James, Union Trust Building, Washington, D. C.

Union of Canadian Municipalities held its 25th annual meeting in conjunction with the Union of Quebec Municipalities on the St. Lawrence River. Controller Plant, of Toronto, was elected President, and Samuel Baker, of London, Ontario, Secretary.

Association of American Municipal Organizations.—The secretaries of ten state leagues of municipalities organized the Association of American Municipal Organizations at Lawrence, Kansas, in December, 1924, to promote the exchange of methods, experiences and accomplishments of the state organizations and to promote the efficiency of their secretaries. The principal service rendered by the member organizations comes through the monthly news bulletin. Each secretary plans furnishing the national secretary with a report of his league's accomplishments and any plans for new or extended services. These reports form the principal data contained in the bulletin. Each organization will also send to the national headquarters duplicate copies of all books, pamphlets, circulars, questionnaire forms and other publications and literature, which will be reviewed in the monthly bulletin. Any secretary may borrow any of this material from the national headquarters. It is also a part of the organization scheme that each member organization exchange the major publications with other members. The headquarters of the League of Kansas Municipalities at the University of Kansas was selected for the secretariat of the organization, and John G. Stutz was named Executive Secretary. Morris B. Lambie, of the Minnesota League of Municipalities, Minneapolis, Minn., was elected President. The second meeting was held at Chicago in December.

State Organizations exist in the following states: California, Colorado, Florida, Illinois, Indiana, Iowa, Kansas, Massachusetts, Michigan, Minnesota, Nebraska, New Jersey, New York, North Carolina, Ohio, Oklahoma, Oregon, Pennsylvania, South Dakota, Tennessee, Texas, Utah, Virginia, Washington, West Virginia, Wisconsin.

There are eleven provincial organizations in Canada.

American City Government League (Leo Kenneth Mayer, Brooklyn, Director) has been engaged in surveys of the municipal ownership and operation of electric light and power plants and prepared an answer under the caption of "Political Ownership and the Electric Light and Power Industry," to the report of the National Electric Light Association.

Citizens' Federal Research Bureau (Washington, D. C.) organized in February, 1924, for the immediate purpose of aiding in fixing the responsibility for corruption in the federal government disclosed about that time, has been organized upon a permanent basis as a "civic organization to investigate and improve administrative efficiency."

The executive secretary, Wallace M. Leonard, will direct the administrative work, while the legal staff of the Bureau is under the direction of J. Weston Allen, formerly attorney-general of Massachusetts, as general counsel.

This Bureau's plan of permanent organization includes an executive council, which will have "responsible direction of the Bureau and an advisory board of men and women, chosen from the country at large to interest and lead 'in promoting zeal, efficiency and probity in the public service.'"

The Bureau is now seeking to raise an annual budget of not less than $50,000 for the first three years. The prospectus of the Bureau reports its activities to date, among which has been the submission to the executive and administrative heads of information bearing upon the conduct of their departments; aid to congressional committees; obtaining evidence of grave offense in the enforcement of federal prohibition laws and examining into qualifications of those "being urged through political channels for appointment to the federal bench."

The Bureau aims to become the clearing house for information obtained by the civic organizations throughout the country, operating in the field of state and city administration.

American Society for Municipal Improvements met in Des Moines, Iowa, October 26-29, E. L. Dalton, of Dallas, Texas, presiding. Charles Carroll Brown, of Lakeland, Florida, the Secretary, retired after 14 years service as Secretary and C. W. S. Sammelman, 3817 Olive Street, St. Louis, was elected as his successor. T. Chalkley Hatton, of Milwaukee, was elected president for next year.

Association of American Municipal Associations (John G. Stutz, Lawrence, Kansas, Secretary) held its second annual conference at Chicago, Illinois, December 17 and 18, with Morris B. Lambie, of Minnesota, presiding.

International City Managers Association (John G. Stutz, Lawrence, Kansas, Secretary). The 12th annual convention met November 17, 18, 19, at Grand Rapids, Michigan. There were 150 registered delegates representing practically all the cities having the city manager plan of government.

C. Wellington Koiner, of Pasadena, Cal., presided. There were nineteen invitations for the 13th annual convention and it was firmly decided to hold the 1926 convention in Colorado Springs, during the month of September. Harrison G. Otis, City Manager of Clarksburg, West Virginia, who has attended all the conventions of the Association, and was for four years its Executive Secretary, was elected President, for the coming year. John N. Edy, of Berkeley, Cal., was elected First Vice-President; W. A. Holt, of New London, Conn., Second Vice-President; and C. W. Ham, of Pontiac, Michigan, Third Vice-President.

Harrison Foundation of Philadelphia created under the will of the late Thomas Shelton Harrison with an annual income of from $20,000 to $30,000 has appointed Clarence G. Shenton, Assistant director of the Philadelphia Bureau of Municipal Research, as director.

The Harrison Foundation is interested at the present time in three pieces of research. The first is the survey of the municipal court in which the Bureau is acting as the Foundation's agent. The second is a study of magistrates' courts; the third is a study of charitable trusts in Philadelphia, undertaken principally to find out whether there are any trustees in the city who are having difficulty in applying their funds to the purposes for which the trusts are created.

Philadelphia Bureau of Municipal Research reports that its outstanding accomplishments during the year have been the completion and publication of its report of Municipal Street Cleaning in Philadelphia and of its study entitled, "Philadelphia Government," a descriptive statement and chart showing the interrelationship of the five hundred or more local units of government. Among other activities listed are: the preparation of a card index of Philadelphia ordinances, running back to the year 1789, which has been completed; the continuation of its studies of the city's borrowing power, debt policies and related matters, upon which a report is being prepared. A report on employment conditions in the city government is under way. In coöperation with the mayor, the Bureau is studying the gas problem, the present lease of the city's gas works expiring in 1927. The Bureau maintains a library of twelve thousand books, pamphlets and periodicals on civic subjects, which is used by the public in its quest for information on these subjects.

CITY POLITICS

By Clinton Rogers Woodruff

Honorary Secretary of the National Municipal League

New York's New Mayor.—New York's quadrennial mayoralty campaign began early in the summer when the regular Tammany organization through its official leader with the backing of Governor Smith entered State Senator James J. Walker as a candidate for the Democratic nomination against Mayor Hylan. A vigorous and acrimonious primary fight was inaugurated, resulting in the defeat of the Mayor. Arrayed against the Mayor was practically every newspaper of the city with the exception of the Hearst press. His denunciation of the newspapers as servants of the "traction crowd" and of Wall Street was not intelligent as *The Outlook* pointed out, but it hardly warranted the treatment which the press gave him in this campaign. Weak and faulty as Mr. Hylan's administration of the city has been, it had not lacked certain merits.

Frank D. Waterman won an overwhelming victory in the Republican primaries and was Senator Walker's opponent. The result of the election was evident from the outset, Walker winning by a majority of over 400,000. Senator Walker's campaign backed as it was by the whole Tammany organization was based on the claim that as a State Senator Walker had been influential in giving to the city workmen's compensation; emergency rent laws; widows' pensions; soldiers' bonus; eight-hour working day; Sunday baseball; Sunday movies; five cent fare and many humane and progressive laws. Here was a record which, added to a lively and human personality and backed by all the force of Tammany proved to be invincible. The Republican organization in New York was poorly equipped for a fight with a body of trained political workers. It was the old story of the regular forces against an undisciplined body of casual workers.

Boston's Mayoralty Election.—Fundamentally, the Boston election was the result of three things: a bitter division in the ranks of the Democrats, the entry of a strong Republican candidate not of the "highbrow" variety, and finally, the adroit work of the Good Government Association, a body which is largely maligned, but still remains a powerful factor in Boston politics. Several Democrats came into the field and, of these, at least three had hopes of getting the G. G. A. endorsement because such endorsement has invariably gone to a Democrat during the past twenty years. They remained in the field until the time for withdrawal had expired, still cherishing the hope of an endorsement. Immediately after this time had expired, the G. G. A. came out with a strong endorsement of Nichols and this action, combined with strong Republican support, enabled him to win handily in a badly divided field. Each of the Democratic factions blames the other. As a Boston newspaperman expressed it, "There were too many mules in the same pasture." Discontent with Democratic rule had very little to do with it.

MUNICIPAL HOME RULE

By Clinton Rogers Woodruff

Honorary Secretary of the National Municipal League

HOME RULE IN NEW YORK

On July 6, the Appellate Division of the Supreme Court of New York rendered a unanimous decision in the case of *Browne vs. Board of Estimate*, declaring that the Home Rule Amendment to the State Constitution was null and void. Immediately after this decision, steps were taken to carry the case to the Court of Appeals. This Amendment was enacted by the Legislature in 1922, reenacted in 1923 and ratified by the people in November 1923. A Home Rule Enabling Act was passed in 1924 and various cities of the State established their municipal assemblies under it, more than two score cities in the State having passed at least two hundred local laws which were affected by this decision.

As finally ratified the Home Rule Amendment was the result of many years of struggle; as far back as the Constitutional Convention of 1867 the adoption of such an amendment was advocated, and in 1894 it was a live public question. Its passage has been hailed as an important reform, and the people had spoken decisively in favor of it. The Amendment itself has been complained of by some students of municipal government on account of its vagueness of phraseology, but it was regarded by thoughtful students as in many respects among the most logical and best thought out home rule amendments in the country. The experiment was important because of the size of the State and the number of cities affected by it.

The decision of the Appellate Division involved nothing with regard to the principle of home rule itself. The case turned on a constitutional question. The amendment was declared void because of an irregularity which the court found in the procedure by which it was submitted to the people. In 1922 the Home Rule Amendment was passed for the first time. At the same session there was passed for a second time an amendment to Article XII of the Constitution relating to the return of local bills to the clerk of the house in which they originated rather than to the house itself. This amendment was ratified by the people. The Court declared that this intervening amendment, though it only altered a section of the article of the Constitution which the Home Rule Amendment completely eliminated, was sufficient to nullify the then pending Home Rule Amendment. The Court also found that the Home Rule Amendment was not entered in full on the journals of the two houses.

This decision of the Appellate Division was promptly appealed to the Court of Appeals and was equally promptly overruled on September 2 when speaking for a unanimous court Chief Justice Hiscock issued the following announcement:

"First—That the so-called Home Rule Amendment of Article XII of the Constitution was properly and legally adopted and on January 1, 1924, became and now is a part of the Constitution.

"Second—That under the authority of the Constitution as thus amended the City Home Rule Statute (Chap. 363, Laws 1924) was legally enacted.

"Third—That consideration had not been completed of the question whether under said statute the City of New York was authorized to adopt laws providing for the municipal ownership and operation of bus lines and decision of that question, therefore, is reserved until the October session. That at that time a formal decision will be handed down with accompanying opinions."

This settles the major point raised by the decision of the New York Appellate Division last July. The Home Rule Amendment and the functioning of the New York City Municipal Assembly and other local legislative bodies is declared legal. The question whether the so-called Craig Bus Bills cover matters within the scope of municipal "property, affairs and government" the court reserves for later consideration as being less critically important.

HOME RULE ENCROACHMENTS IN OREGON

In January, the representatives from 25 cities of Oregon met in Portland to establish a League of Oregon Cities. The immediate occasion for the meeting was an appeal from one of the small cities for assistance from her sister cities in preventing the legislature from putting through a general law designed to give to the state traffic officers control over traffic policing in the smaller cities. This situation arose from complaints of autoists that many of the towns were overzealous in enforcing their traffic ordinances on speeding motorists. However, the larger cities, especially Portland, have also for some time felt the need for such an organization to combat encroachments of the state on the powers of the cities. Article XI of the State constitution provides, by an amendment of 1906, that "the Legislative Assembly shall not enact, amend or repeal any charter or act or incorporation for any municipality, city or town. The legal voters of every city and town are hereby granted power to enact and amend their municipal charter, subject to the constitution and criminal laws of the State of Oregon."

This clause is the basis for what has commonly been assumed to amount to a grant of home rule. During recent years, however, the legislature, supported by the supreme court, has gradually undermined the autonomy of the cities by the slightly indirect process of passing general laws, rather than specific amendatory acts, affecting the powers of municipalities.

One of the striking limitations of the powers of the city of Portland is the Tax Supervising and Conservation Commission, established in 1921. This commission, appointed by the governor, has the power and duty to survey all the estimates of the city commissioners, and, in the words of the law, "shall carefully consider the proposed budgets, approve, reject or reduce the same or any items therein, or, by unanimous vote of all the members of the commission, increase the same . . . upon the request in writing of the proper tax-levying board." This discretionary power in the hands of the Tax Supervising Commission is a source of friction, and, it is contended, leads to irresponsible government. In actual practice it allows the tax commission to pass upon matters of city policy, through its power of rejecting or reducing any items. This is illustrated by the refusal of the commission to grant the city's recent request for an added force of twenty-five policemen to combat the crime wave. There have been numerous complaints in regard to such matters as the reduction of salaries and the refusal of particular appropriations.

The supreme court has, in a number of decisions, held that the constitutional provision granting home rule does not prevent the legislature from passing such general laws, even though they do in fact radically modify the powers of cities in matters of predominantly local interest. The legislative committee of the League of Cities is endeavoring to secure the adoption of an amendment to the constitution which will further fortify the autonomy of the cities. The proposed amendment stipulates carefully that municipalities shall not be controlled by "general laws" in matters relating to "local, special and municipal legislation, and municipal affairs of every character in and for their respective municipalities."

CHICAGO AS A FREE STATE

A resolution has been introduced into the City Council, which was duly adopted requesting the Corporation Counsel to outline the proper legal procedure by which Chicago could separate from the state of Illinois and seek admission to the Union as another State.

CITY MANAGER GOVERNMENT

By Clinton Rogers Woodruff

Honorary Secretary of the National Municipal League

Kansas City Manager Plan.—On February 24, Kansas City adopted its Council-manager Charter by a vote of 37,504 to 8,827. The results of the first election under the new charter are at this writing (Dec. 15) undecided. Party names were not much referred to during the campaign; yet there was the keenest kind of partisan spirit manifest. The Republicans nominated Mayor Albert I. Beach for reëlection. He and his associates were known as the "Beach Group." This Beach Group had the prestige of the present successful administration. The Democrats nominated Ben Jaudon, the city treasurer and a popular man and he and his associates were known as the "Jaudon Group." On the first returns it appears that the Beach Group elected the Mayor and three councilmen and the Jaudon Group elected five councilmen, giving the control of the Council of nine to the latter. One of the Jaudon Group candidates for councilmen, George L. Goldman, received a majority of only 305 votes out of 114,000 cast. His election is being contested by the Beach Group in hopes of securing a fifth councilman and thus giving the Beach Group control of the Council. Nearly all of the candidates are said to be high grade citizens; but all are more or less animated by partisanship. Most of those elected are pledged to give the new charter a full and fair trial in letter and spirit. If the campaign pledges are adhered to, there will be a good council regardless of whether it is dominated by the Beach or the Jaudon Group. The Jaudon Group is also contesting the election of Mayor Beach who had only 548 majority.

Cincinnati Manager Plan.—This city adopted the new form in 1924, and has chosen Lieut. Colonel O. Sherrill of Washington, D. C., as its first city manager. He has been in charge of the Building and Grounds in the District of Columbia since the beginning of President Harding's administration.

Seattle Defeats City Manager Plan.—An amendment to the charter of Seattle, Washington, providing for a city manager form of government was defeated at the annual election, March 10, by 4,519 votes. The total vote cast for the amendment was 22,789; against it, 27,308; total vote cast at the election, 56,615; total registered voters, 118,210. These figures are significant of the interest of the voters in the movement. The existing city government and its 5,500 employees including 2,000 municipal street car employees were organized against the amendment. During the preparation of the city manager amendment and before it was finished representatives of the city's employees notified members of the Municipal League which sponsored the movement that if a clause in the proposed amendment, whereby the city manager had the final decision on dismissals of civil service employees, were eliminated, thus leaving the final decision in such cases with the civil service commission, the civil service employees would not oppose the amendment. This clause remained in, and the amendment had to undergo the strenuous opposition not only of the city employees' organization—but also of organized labor which strongly sympathized with that League.

City Manager of Pasadena Resigns.—C. W. Koiner, the City Manager of Pasadena, Cal., resigned his position on July 1 on a question of principle involving directly the fundamental basis of the manager form of government. Following the election of four new members of the Council known as the board of directors, an ordinance was prepared dividing the administrative organization into seven departments placing one member of the board in charge of each department. Under this plan the manager would have to secure the approval of the appropriate councilman before he could appoint or remove any employee in that department.

Mr. Koiner believed that this opened the gate to the spoils system and brought about a division of responsibility foreign to the manager plan. He very properly resigned and Pasadena has lost the services of a leader of the profession. It is unfortunate in the opinion of the Secretary of the City Managers Association that the city charter did not provide more specifically for the duties and powers of the manager. Under the old board of directors, the city enjoyed the benefits of the plan in its true form. The board remained a policy determining body; the manager was in charge of administration and was directly held responsible therefor.

Other Places.—Cape May, New Jersey, has the distinction of being the first city to adopt the manager plan in New Jersey under the new optional charter law. The vote was decisive, many citizens feeling that the old hit-and-miss arrangement was reacting unfavorably against the city's prosperity as a summer resort.

Rochester, N. Y., by a majority of 14,000, in a vote of 64,000 adopted a city manager charter at the November election, which will go into effect on January 1, 1928.

Boulder, Colorado, which is one of the four cities in the United States now having manager charters under which the city council is chosen by the Proportional Representation method of voting, by a referendum vote defeated an attempt to withdraw the charter. As a similar attack on the charter had been defeated in 1923, it would appear that most of the citizens of Boulder are satisfied with their present form of municipal government.

Minneapolis has a charter commission which has recommended a City Manager Charter, but it has not been as yet submitted to the voters for formal approval.

Newark. By a vote of five to one the members of the Chamber of Commerce of Newark, New Jersey, favored the adoption of the report of its Municipal Affairs Committee, advocating the council-manager form of government. Notwithstanding this decisive vote, the Chamber will carry on a thorough campaign of education before any attempt will be made to have the people vote on the adoption of such a charter.

Cleveland's City Manager Charter as originally adopted provided that the members of the council should be elected on the basis of the Hare System of proportional representation. A movement to repeal this provision and return to the ward system of electing Councilmen was inaugurated and an election on the amendment held, August 11. Of the 211,828 registered voters, 41,271 came to the polls. The vote for the amendment was 20,353 to 20,918 for proportional representation which will continue as a feature of the Charter.

City Manager Campaigns.—At an election called for the day preceding Memorial Day, a proposal to adopt city manager government in Yonkers, New York, was defeated by 3,600 votes in a total poll of 15,000. Although the vote was negative, the criticisms directed at the municipal administration have already had a salutary influence. The Schenectady campaign for the adoption of the city manager plan failed at the election. The Republican organization was bitter in its opposition and by a ruling of the board of education the schools were closed to debates on the subject. All possible pressure was brought to prevent meetings in other places and the voters had small opportunity to become informed or interested.

DIRECTORY OF CITY MANAGER CITIES

The progress of the City Manager plan has been steady since its first adoption by Staunton, Virginia, in 1908. (Where changes have been made from ordinance to charter, city is listed among charter cities and when year plan was first adopted is shown.)

The following represents the growth of the manager plan by years:

Effective	Char.	Ord.	Total
1908	1	0	1
1912	1	2	3
1913	8	2	10
1914	13	5	18
1915	17	4	21
1916	16	3	19
1917	14	2	16
1918	19	10	29
1919	23	7	30
1920	20	14	34
1921	46	8	54
1922	23	8	31
1923	31	7	38
1924	12	8	20
1925	10	4	14
1926	4	0	4
1928	1	0	1
Not definitely known			14
Totals......	259	84	357

MISCELLANEOUS MUNICIPAL PROBLEMS

BY CLINTON ROGERS WOODRUFF

HONORARY SECRETARY OF THE NATIONAL MUNICIPAL LEAGUE

Streets.—Washington, D. C., has been held by the District Court of Appeals liable for failure to light its streets. In the case of *Berberich vs. District of Columbia* (not yet formally reported) Justice Van Orsdel held that "it is settled law in this District that the commissioners being charged with the duty of maintaining the streets in proper condition are chargeable with negligence in allowing the streets to become unsafe. Unsafe conditions may result from improper lighting as well as from defect in the street, and the degree of lighting required will depend upon the existing conditions. In the present case, as clouds and mist settled in wet and damp weather about this viaduct, the District was charged with the duty of meeting this emergency by proper and sufficient lighting facilities. . . . The jury therefore was not required to pass on the number and character of the lights, but from the evidence whether the lighting at the time of the accident was sufficient to make the place reasonably safe."

Privilege of Proceedings.—Newspaper reports of the proceedings of municipal bodies have been held to be of a privileged character. In the case of *Leininger vs. New Orleans Item Publishing Company* (101 Southern Reporter, 411) the Louisiana Supreme Court applied the principle saying: "A report, by a newspaper, of proceedings had at a public meeting of a municipal council, in which proceedings the public has an interest, when the report is a fair and accurate one of the proceedings had, is privileged, even though it contains matter defamatory of another. . . . Reports of such proceedings are privileged in the same manner as are reports of judicial proceedings. . . . It is not necessary in reports of judicial proceedings, and hence of the proceedings of municipal councils, 'that the report should be verbatim; nor is absolute accuracy essential so long as the report is substantially correct. A few slight accidental errors will not destroy the privilege, provided the whole report, as published, produces materially the same effect on the mind of the reader as an absolutely correct report would have done.'"

Carrying on Business.—A city may engage in business incidental to public utilities operated by it. In the case of the *City of Mayfield vs. Phipps* (263 Southwestern Reporter 37) the Kentucky Court of Appeals found the prevailing will throughout the country to be that if a "business is such as to come within the regulatory power of the municipality, because of its quasi-public nature, it may be authorized by the Legislature in the absence of constitutional inhibitions to itself engage in that particular business for the benefit of the public, and when it does so it is not performing strictly a governmental function, but it is exercising what the opinions hold as its right to conduct the particular business so impressed with public purposes for the public good. Whether it is a wise or unwise policy for a municipality to carry its products from its streets into private residences, and in so doing engage in a private business, is a question with which we have nothing to do, since our task is performed when we apply the existing law to the particular question as presented by the concrete facts. Of course, we would not be understood as holding that a city, without being the owner of such public utilities, could embark in the plumbing or any other strictly private business; but in so far as that business is connected with its plant, which it lawfully owns and has the right to operate, the law seems to be clear that it has the right to perform it; but it could not either furnish material or workmen to perform the same service to an independently or privately owned plant, since its right rests solely upon its incidental power growing out of its ownership."

Rechristened Cities. — Having passed through what the Chamber of Commerce of the United States calls the homespun period of development, American cities and towns appear to be giving more attention to the names by which they are known. Old names are being discarded and new ones adopted. In a study of the origin of names of American cities in 31 of the 48 states the Civic Development Department of the Chamber finds that in the five-year period from 1921 to 1925, 63 changes were recorded, compared with only 13 during the preceding five-year period. "It is apparent," the Department finds, "that interest in local names has increased materially in the last period, particularly in the years 1924 and the first half of 1925, there having been 24 changes in 1924 and 21 during the first half of 1925." Among the states most active in this respect are: New York, 21 changes; California, 18; Oklahoma, 13; Florida, 11. Duplication of names of cities is a serious problem. There are 31 Franklins, 27 Madisons, 25 Clevelands, 24 Lincolns, 24 Monroes, 23 Wilsons, 13 Roosevelts, 15 Adams, 12 Tafts and 5 Hardings. Capitals of nations have also been a source of duplication. There are 18 Genevas, 17 Berlins, 12 Moscows, 11 Viennas, 6 Pekins and 2 Brussels.

BILLBOARDS

By Clinton Rogers Woodruff

Honorary Secretary of the National Municipal League

Billboard Interests.—The billboard interests of the country have been generally combined in the General Outdoor Advertising Co., Inc., of New York. This organization is aware of the growing public resentment against billboards and has issued a statement entitled "Standards of Recognized Outdoor Advertising," in which are included two items that would be most important if they could prevail. They are:

"1. Structures should not be located in purely residential districts, or in locations where the resentment of reasonably minded persons would be justified; in locations that obstruct the view of natural beauty spots; on trees, rocks, fences, posts or natural objects; on locations that would tend to endanger traffic. 2. Structures shall not be erected except on property owned or leased for that purpose, and in no instance within the confines of the public highway."

Investigation.—The National Association of Real Estate Boards has instructed its Committee on City Planning and Zoning to commence investigation as to how billboards' use should be regulated so as to conserve scenic beauty and at the same time provide opportunity for legitimate advertising. The investigation will be made with the purpose of formulating suggestions as to what legislation may wisely be enacted by municipalities and by States to extract the nuisance element from this form of outdoor advertising. It is the purpose of the Association, through its 545 constituent boards, to urge the enactment of such legislation. In the meantime it is calling on city planning and zoning commissions to devise methods of proper control, and asking executives of cities and states to study this matter and to act. It is not opposing the use generally of billboard or signboard advertising. But it does hold that the erection of obstructive signs is out of place in a residential section of a city and in any position in the open country where such signs deface a scenic spot or mar the view from a scenic highway or boulevard.

Platform.—This position of the Association and the action which will be taken by it in regard to this subject are stated in a resolution passed unanimously at the annual convention held in Detroit, Michigan, June 23-26, of this year. The resolution is as follows:

"We recognize that the natural beauty of our country is a public heritage to be conserved. It is a community possession, and no individual and no corporation has the right to despoil the natural scenic beauty of the land for private profit.

"We believe that with the growth of the movement for city planning and zoning as a means to direct the future development of American cities, stabilize their land values and preserve their æsthetic values for community living, we should give serious consideration to the problem of outdoor advertising as one phase of the whole zoning movement.

"We hold that the indiscriminate use of signboards today retards the development of desirable districts, and tends to destroy values in districts already built up, and that such signboards have become an offense to the public generally. We hold further that the time has come when we should determine whether or not the character, location, extent and maintenance of signboards cannot be so regulated and controlled as to give legitimate opportunity for necessary advertising without the continuance of the present harmful conditions. Therefore, be it

"Resolved, That the National Association of Real Estate Boards recommends to the various executives, city and state, and to the various planning and zoning commissions, that immediate study be made of this problem, both with reference to county and state areas, which shall prevent the destroying of the beauty spots of the open country and bring about discontinuance of unsightly conditions in our cities. And be it further

"Resolved, That the National Association instruct its Committee on City Planning and Zoning immediately to commence investigation as to the possibilities of just regulation of billboard use, and to recommend legislation to make such regulation effective."

Recent legislation restricting outdoor advertising in three New England states points to definite progress. In Connecticut, the Pierrepont Bill imposes a license fee of five cents per square foot.

In Maine, the original bill introduced by Mr. Hale, of Portland in 1924, forbade the display of billboards unless licensed by the Secretary of State and authorized by the municipal officers. It imposed a tax of one dollar, plus five cents per square foot. But, the bill actually passed in 1925 merely forbids the erection or maintenance of billboards in highways, or "so situated with respect to any public highway as to obstruct clear vision of an intersecting highway or highways, or otherwise so situated as to prevent the safe use of the public highway."

In Massachusetts, on January 24, 1924, the Massachusetts Department of Public Works, after public hearings, promulgated new rules and regulations for the control and restriction of advertising devices. In consequence, the Poster Advertising Association of the United States and Canada has filed a bill in equity in the Federal Court (at Boston) requesting the Court to issue an injunction restraining the Public Works Departments of the state and of certain cities, including New Bedford, Pittsfield and Easthampton, from "molesting their business or property." They state that "it is impossible for the complainants to continue in business and comply with said rules and regulations."

Confusion.—The salient incidents of these three incidents as pointed out to the American Civic Association by H. A. Caparn are: (1) The adoption of the taxation principle in Connecticut, and its being looked on as a means of partial suppression. (2) The control of billboards by three different authorities (Superintendent of State Police in Connecticut, municipal courts and trial justices in Maine, and the Public Works Department in Massachusetts). The rejected Maine Bill gave control to the local authorities, subject to the license of the Secretary of State. (3) The ignoring in the Maine Bill of all objections to billboards excepting as dangers to traffic. (4) The adoption of the so-called "æsthetic" principle of regulating billboards in Massachusetts. The story of Massachusetts is the most stimulating. The constitutional amendment (Art. 72), passed in 1918, reads thus: "Advertising in public ways, in public places and on private property in public view may be regulated and restricted by law."

Pennsylvania Proposition. — In Pennsylvania a bill was introduced by Senator Buckman to place under the control of the Secretary of Highways all advertising signs visible from the State highways authorizing him, under the police power of the State, to permit only those to remain or to be newly erected that do not, in his judgment, add to the dangers of the traffic on such highways by diverting the attention of the drivers of vehicles used thereon.

This general proposition has been discussed with Attorney General George W. Woodruff of the State of Pennsylvania; with Dr. Clyde L. King, secretary of the commonwealth; with William H. Connell, deputy secretary of highways of Pennsylvania; with Everett L. Millard, a Chicago attorney who has successfully carried a famous billboard case through the United States Supreme Court, and with Frank B. Williams, counsel for the National Committee of Restriction of Outdoor Advertising, of New York city. All these authorities agree according to J. Horace McFarland who drafted the bill that the principle is sound and that the police power of the state can properly be exercised as proposed in protection of public safety along the state's highways. The opinion has also been expressed that as abutting property owners benefit greatly from the building of improved roads by the state and federal authorities, and as they are not assessed for any part of the cost of such roads, they might legally be restrained from maintaining or erecting private advertising signs that tend to interfere with the safety of traffic.

FIRE PREVENTION

BY CLINTON ROGERS WOODRUFF

HONORARY SECRETARY OF THE NATIONAL MUNICIPAL LEAGUE

Discussion.—The outstanding development in the fire protection movement is the rapid extension of the field service of the National Fire Protection Association; to the support of which the principal industries are responding and through which project it is hoped to bring about a very definite reduction in the present preventable fire waste. The method of attack chosen at the outset, and which presumably must be followed for a number of years, is to make a special study of local conditions in a selected number of cities showing high fire losses over the last five-year period and to stimulate or create local agencies to undertake and achieve the desired improvement.

Needs.—These methods applied in some thirty cities during the past year have met with signal success so far as the response of influential citizens is concerned, and in most of these, causes of the daily fires have been easily disclosed and the necessity for action along the following lines clearly demonstrated:

(a) Competent inspection by a fire prevention bureau of the Fire Department to keep the city free from rubbish accumulations and other bad housekeeping conditions which cause fires.

(b) Revisions of, or amendments to the building code requiring greater general use of fire-safe materials in building construction, fire-resistive roof coverings, protected vertical and horizontal openings and automatic sprinklers.

(c) Adequate ordinances governing the storage and use of explosives and inflammable liquids.

(d) Adequate laws and procedure for apprehending and convicting incendiaries.

(e) Public education in the proper transmission of fire alarms and the value in all properties of first aid extinguishing devices. These remedies are regarded as simple as a kindergarten lesson, and there is no doubt of their effectiveness if applied, but action in these matters cannot be secured by correspondence or the dissemination of literature. The creation of a competent local committee of influential citizens assembled about the city officials charged with the community fire safety furnishes the most practical organization for a successful attack upon these conditions. Such a local committee, in whatever spirit of enthusiasm it may be created, requires constant encouragement and stimulation. It is the function of the field work of the Association to advise with and serve such committees where they exist and to create them where needed.

National Organization.—The Chamber of Commerce of the United States through its Insurance Department is carrying on a similarly vigorous campaign in conjunction with the National Fire Waste Council. Its principal propaganda is through the observance of Fire Prevention Week with the cooperation of the trade associations affiliated with the Chamber. A feature of Fire Prevention Week is the "Inter-Chamber Fire Waste Contest," the results of which are announced early in the year following the contest. The 1924 contest was the third so far held.

The purpose of the National Fire Waste Council is to coöperate with chambers of commerce and trade associations in their fire prevention activities. Its members may be called upon for assistance at any time. They are as follows: American Institute of Architects, American Institute of Electrical Engineers, American Society of Mechanical Engineers, Boy Scouts of America, Factory Mutual Inspection Department, Fire Marshals' Ass'n. of North America, International Association of Civitan Clubs, Mutual Fire Prevention Bureau, National Association of Credit Men, National Association of Insurance Agents, National Automatic Sprinkler Association, National Board of Fire Underwriters, National Fire Protection Association, Railway Fire Protection Association, Underwriters' Laboratories, U. S. Bureau of Chemistry, U. S. Bureau of Mines, U. S. Bureau of Standards, Western Actuarial Bureau.

Fire Losses.—America's bill for fire waste was $1,044 a minute, an annual loss of $548,000,000, exceeding all previous high records. These are the figures of the Actuarial Bureau of the National Board of Fire Underwriters quoted in a bulletin issued by the Insurance Department of the Chamber and the National Fire Waste Council. The total amount of property destroyed during the year was equivalent to more than half the annual interest on the national debt. Much of this enormous loss is preventable waste. "Although the fire losses of the United States continue to mount," says the bulletin, "it is not necessarily an indication that they cannot be reduced. The experience of the 1924 Inter-Chamber Fire Waste Contest shows that losses in the reporting cities were reduced to the extent of $4,000,000 over their average for the preceding five years coincident with the activities undertaken by local fire prevention committees. The per capita loss in these communities was $3.10, as compared with the national average of approximately $5.00. What has been done in some cities might well be duplicated in others through energetic fire prevention programs carried on under the auspices of local chambers of commerce and similar organizations. Although fire waste is a national problem, it can only be solved through the combined endeavor of all communities."

DIVISION VII

TERRITORIES AND DEPENDENCIES

ORGANIZED TERRITORIES AND GOVERNMENT

By Frank McIntyre
Major-General and Chief of U. S. Bureau of Insular Affairs

ALASKA

Labor.—George A. Parks was appointed Governor in 1921 succeeding Thomas Riggs. The Governor reports that the slow but steady progress apparent for many years has continued.

Because of the scarcity of local labor in some districts and the short fishing seasons the canneries must depend to a large extent on labor imported from outside of the Territory. Further study may solve this problem by evolving a plan for the development of diversified fishing which will provide almost continuous employment for this labor. If this can be brought about it will result in a substantial increase in the permanent population in the coastal regions.

Fisheries.—The value of the fisheries products and the investment in the fisheries increased about 4 per cent. over 1923. The chief expansion was in the herring industry. All fishing operations were carried on under the regulations promulgated by the Secretary of Commerce as authorized by the act of June 6, 1924. Fishing seasons were shortened, or commercial fishing for salmon closed entirely, in many districts and an effort was made to regulate the fishing so that a sufficient escapement of salmon would reach the spawning grounds.

The closed season provided for in the North Pacific halibut treaty became effective for the first time in 1924. Under this treaty fishing for halibut was prohibited for three months, beginning November 16, 1924. It is interesting to note that the enforcement of a three months' closed season did not result in decreased production. On the contrary the catch was considerably increased over 1923.

The census of the seal herd on the Pribilof Islands indicates a substantial gain and the revenue derived from the sale of sealskins was more than $700,000.

Industries.—A gradual resumption of mining, both placer and lode, is apparent in all of the districts. The gold production in 1924 exceeds that of 1923. The supply of common labor for all branches of industry in the Territory was generally satisfactory during the year. Exploration in the several oil fields continued throughout the year, but so far the wells on the Alaska Peninsula have not produced oil in commercial quantities. The only producing oil wells are near Katalla.

Transportation facilities continue to improve to keep up with the increased travel during the summer season. The airplane service inaugurated last year in the Tanana Valley is greatly improved. The wagon roads and trails have been improved and extended throughout the Territory.

Fox farming is one of the important industries and it is estimated that there are approximately 391 farms containing over 36,000 foxes. The total value of the improvements and stock is estimated to be about $6,000,000. The propagation of blue foxes has developed very extensively in Alaska in the last five years, especially on the smaller islands, each of which can be used exclusively by one fox rancher.

Realizing the great value of fur and game to the Territory and the need for making Alaska's lands sustain such animals to the fullest possible extent, the Territorial legislature of 1925 passed an additional act adopting a program of stocking suitable available lands of Alaska with valuable fur and game animals.

A total of 1,280 reindeer has been imported from Siberia since 1891. There are now in Alaska approximately 300,000, and it is estimated that two-thirds of them are the property of Eskimos. It is estimated that there are in northern and western Alaska approximately 200,000 square miles of treeless region, worthless for agriculture, which could furnish pasturage for about 4,000,000 reindeer. At a not distant date the United States may draw a considerable part of its meat supply from the reindeer herds in Alaska.

Finance.—The condition of the Territorial treasury for the year ended December 31, 1924, was as follows:

Balance of cash on hand, Jan. 1, 1924	$148,911.53
Total receipts from all sources	976,753.10
Total disbursements under appropriation made by the Territorial legislature	858,550.46
Balance of cash on hand, Dec. 31, 1924	267,114.17

At the close of the year there were thirteen Territorial and four national banks doing business in the Territory.

Combined deposits in the several Territorial banks June 30, 1925, totaled $6,920,937.97 as compared with total of $6,609,427.81 at corresponding call of June 30 of the year previous. The combined capital of all Territorial banks totaled $630,000 as compared with $605,000 for the year previous.

There are at present eighteen incorporated towns in Alaska, sixteen of which have a total assessed property valuation of $21,283,127.97. The rates of taxation range from 10 to 20 mills.

Tourist business for 1925 was greater than that in 1924. The outstanding scenic attraction of Alaska is Mount McKinley National Park. It is the second largest national park in the United States, comprising an area of 2,645 square miles, the chief feature of which is the highest mountain in North America, Mount McKinley.

Governor Parks has recommended the creation of a constabulary or Territorial police responsible for law enforcement in the Territory to replace the eight organizations now in existence.

Railroads and Roads.—In July, 1924, Mr. Noel W. Smith was appointed special assistant to the Secretary of the Interior, and was sent to Alaska to study the operation of the Alaska Railroad and to make recommendations to the Secretary as to the future policy of the road and an estimate of the cost of completion. Mr. Smith assumed personal charge of the operation of the railroad, and later he was appointed general manager. It is estimated that to complete the Alaska Railroad—furnish it with the necessary facilities and equipment for performing its proper function as a transportation agency —an expenditure of $11,878,781 will be necessary. This expenditure for completion is due to the fact that in the original construction the early completion of the line was considered important, and it was found necessary to adopt many expedients, such as construction of wooden trestles from hastily cut and prepared native piling, the building of bridges on pile foundation instead of permanent masonry, the laying of track without the proper quantity of ballast under the ties, constructions of cuts and fills with only sufficient width to allow of laying the track, and similar methods of construction. The result of this character of construction is that the costs of maintenance are entirely out of proportion to what they will be when the railroad is completed.

The Alaska Railroad, during the fiscal year 1925, made progress in economy and efficiency of operation and maintenance as follows:—Earnings from rail and water transportation were $861,237 as compared with $907,174 in 1924. Expenses for maintenance and operation were $2,152,802 as compared with $2,643,750 for 1924. The deficit decreased from $1,739,274 in 1924 to $1,295,099 in 1925, or 25.5 per cent. Service for other departments of the Government, amounting to $92,277, is not included in the above revenue.

Several bridges have been rebuilt and improvements made to tracks and road bed.

The Alaska Road Commission's energies were largely directed to extending the general rehabilitation to trails and roads in remote portions of the Territory begun in 1920. This gradual rehabilitation, starting upon the more important projects, has now reached trails extending to all inhabited parts of the Territory. The work accomplished during the fiscal year may be summarized as follows: New construction, 46¼ miles wagon road, 45 miles sled road, 188 miles trail, and 1,040 linear feet of bridges of over 60-foot span. In addition several miles of wagon road were reconstructed, many miles graveled and a number of small bridges and culverts rebuilt. There were also many miles of various classes of roads and trails on which maintenance work was done. The work of maintenance and rehabilitation has been pushed and the roads and trails under the jurisdiction of the board are in better shape than ever before.

Education.—There are seventeen schools with 124 teachers and an enrollment of 2,822 pupils in incorporated towns. The per capita cost of these schools for the school year 1924-1925 was $106.63. Schools were maintained in fifty-six districts outside of incorporated towns. The per capita cost of these schools was $117.98. There were seventy-one teachers and a total enrollment of 1,258 pupils. In addition to the above, four coöperative schools were maintained. Citizenship night schools were conducted in ten communities. A keener interest was shown in these schools than at any time since their establishment in 1917. The third year of the Agricultural College and School of Mines finds this institution with an increase in its enrollment of more than 50 per cent. over last year. The total enrollment is 133.

Health.—The Bureau of Education maintains for medical relief for the natives five hospitals with a staff of physicians and surgeons, nurses, cooks, and orderlies at Noorvik, Akiak, Nulato, Kanakanak, and Juneau, and contractual relations with a number of other hospitals in Alaska as well as outside in Washington and Oregon.

During 1924 there were recorded 568 deaths and 641 births in the Territory.

Tuberculosis continues to exact its heavy toll among the natives. During the first part of January diphtheria appeared at Nome. There were thirty-four cases with five deaths. A supply of antitoxin was dispatched from Fairbanks by special dog team, with no further deaths reported after its arrival.

It is believed that no great improvement in the deplorable condition of the native races is possible until some form of Territorial contact is made with the various services and agencies engaged in medical relief among them.

Commerce and Industries.—The number of persons employed in the fisheries of Alaska in 1924 was 25,194. The total active investment in the fisheries was $62,660,637, of which $52,677,670, or approximately 84 per cent., was invested in the salmon-canning industry. The total value of Alaska fishery products, exclusive of aquatic furs, was $40,289,273, an increase of $1,610,448 over the preceding year.

The Alaska mines in 1924 produced $17,457,333 worth of minerals as against $20,330,643 in 1923.

Alaska produced 74,071,273 pounds of copper, valued at $9,703,721, as compared with 85,920,645 pounds in 1923, valued at $12,630,335.

About 100,000 tons of coal were produced from eight mines as compared with 119,826 tons from twelve mines in 1923. The Alaskan coals at present commercially available range in quality from low-grade lignite to semi-bituminous. Of the coal mined during the past fiscal year all but a negligible percentage may be classified as sub-bituminous, 30 per cent. of which, produced in Nenana field, is of a type bordering on high-grade lignite and 70 per cent., produced in Matanuska field, is of a type bordering on true bituminous.

All the petroleum produced in Alaska was from sixteen small wells, all on patented claims owned by the Chilkat Oil Co. During the fiscal year eighty-four applications for oil permits were filed in the land office covering 225,753.44 acres.

The lumber cut of the national forests was 52,500,000 feet, an increase of 17 per cent. over that of 1923.

ALASKAN TRADE

(Period July 1, 1924, to June 30, 1925.)

	Fiscal Year Ended June 30, 1924	Fiscal Year Ended June 30, 1925
Total shipments of merchandise to United States.....	$53,821,239	$55,440,645
Gold and silver to United States..................	6,183,241	5,602,217
Total shipments	$60,004,480	$61,042,862
Total value of shipments to Alaska................	31,719,251	33,621,969
Balance of trade in favor of Alaska................	$28,285,229	$27,420,893
Classification of principal shipments from Alaska:		
Canned salmon	31,173,975	31,682,221
All fish and fish products, including canned salmon..	36,852,075	38,584,837
Copper ores	12,443,412	11,491,992

HAWAII

General Conditions.—W. R. Farrington was appointed Governor of Hawaii on July 5, 1921, on the retirement of C. J. McCarthy.

The visit of the united fleet of the United States Navy during the combined Army and Navy maneuvers turned the nation's attention to the importance of Hawaii in the scheme of national defense.

The forest reserve system has been enlarged, particularly on the island of Cahu, where the water situation is becoming acute.

A Hawaiian Homes Commission, charged with the rehabilitation of the Hawaiian race, as authorized in the Hawaiian homes law of 1921, has been in active operation a little over four years and has established nearly 2,000 Hawaiians on homesteads and house lots.

Tourist travel to Hawaii showed a large gain in arrivals over the corresponding months for 1924. The phenomenal gain has been in summer visitors. The number of tourists in Hawaii for 1925 (partially estimated) is 14,500. Private automobiles number 24,383.

The Hawaiian National Park (volcano) has benefited by the park road building program authorized by Congress. Approximately 60,000 visited the park this year.

Population.—The most recent estimate of population, June 30, 1925, is as follows:

Races	Numbers
Japanese	128,068
Chinese	24,851
Hawaiian	43,327
Portuguese	29,416
Filipino	49,335
All others	48,648
Total	323,645

Finance.—Notable legislation passed at the regular 1925 session of the legislature included the budget act, the retirement or pension act, and the continuation of the accountancy commission, authorized to install modern accounting systems throughout the Territorial and municipal governments. The budget act is based on the Federal Budget scheme, and the pension system will give to every civil employee of the Territory at least 50 per cent. of his salary on reaching retirement age.

The Territory has enjoyed a steady growth and continued prosperity. Twenty-nine banks were in operation at the close of the year with deposits of $60,809,715.97, the highest on record. The taxes collected to carry on the domestic administration of the Territory and its municipal divisions amounted to $11,828,985.23. The cost of assessing and collecting taxes was 2.08 per cent. The assessed value of the real and personal property totals $360,832,895. The bonded indebtedness of the Territory is $17,990,000. Tonnage of shipping entering ports of Hawaii increased from 868 ships of 5,089,783 tonnage in 1915 to 1,068 ships of 7,993,137 tonnage in 1925. Hawaii's trade with the mainland of the United States doubled in value for the same period.

The legislature also passed the laws necessary for Hawaii to qualify and participate in Federal aid for roads, vocational training, and health, as authorized by the bill of rights passed by the Sixty-eighth Congress.

Citizenship. — Another step is needed to complete the recognition of the Territory of Hawaii as part and parcel of the United States, namely, prompt and unquestioned recognition of the American citizens born in this part of the United States when they are traveling to any other part of our country. The immigration authorities refuse to accept the birth certificates issued under Territorial authority to American citizens of oriental ancestry. The legislature authorized the governor to appoint a commission to proceed to Washington and present the matter to the appropriate departments and to the Congress if that should be deemed necessary.

Education and Sanitation.—The Territorial department of public instruction has general control over private as well as public schools. The Territorial school budget for the biennium of 1926-27 authorized by the legislature of 1925 calls for an expenditure of approximately $10,600,000. There are 175 public schools with 1,719 teachers and 55,044 pupils, and 65 private schools with 462 teachers and 9,872 pupils, or a total of 240 schools, 2,181 teachers and 64,916 pupils. The University of Hawaii has 1,096 students.

Good health is indicated by a lowering death rate and an advancing birth rate. Tuberculosis continues to take the heaviest toll of any disease. Measures for the control and cure of leprosy are proving effective. The board of health of the Territory records the lowest annual death rate in its history. The death rate for the year was 12.74 per 1,000 and for 1924, 13.93. The races showing the highest and lowest mortality were, respectively, the Filipino, 287.38, and Caucasian, 36.96. The birth rate was 41.57 per 1,000 population.

Agricultural.—The total area of public lands is 1,598,149 acres, of which 67,000 acres are agricultural land.

Progress of the agricultural industries is most gratifying. The sugar and the pineapple enterprises have harvested the largest crops of record. The sale price of both sugar and canned pineapples has ruled lower than the previous year, but the total income to the Territory is not materially reduced. The coffee industry has held its own through many vicissitudes and now offers a fair prospect of advancing.

Labor.—There is at present no shortage of labor in the main industries, though the year has witnessed the collapse of a labor agitation among the Filipino laborers, intended to bring about a general strike on the sugar plantations. It is believed that in no other sugar-cane producing country of the world are the laborers and their families better cared for, better paid, or better rewarded for their hard work than those employed in the sugar industry of Hawaii.

PORTO RICO

Conditions.—Governor Horace M. Towner reports steady progress in all lines of endeavor in Porto Rico. The Chief of the Bureau of Insular Affairs of the War Department visited Porto Rico during the year. He found evidence of material progress in every field of governmental and private activity. The most noticeable governmental progress was in the erection of necessary public buildings and the extension of the splendid highway system of the Island.

The Island is almost wholly agricultural and has an area of 3,600 square miles. Its population numbers 1,300,000. The serious problem in Porto Rico is the excess of population. To a slight extent it is being met by the gradual development of small industries. There is, however, no noticeable increase in the departure of emigrants from the Island. In Haiti, for example, a marked element of its present prosperity is due to the funds brought back to the Republic by Haitian laborers returning from Cuba and Santo Domingo.

There is a steady growth in the foreign trade. More than 90 per cent. of this is with the United States.

Finance.—The receipts of the government have fallen far short of the expected revenues. The Governor reports that there has been considerable opposition to the payment of taxes. One reason has been because of unforeseen defects in the law which afforded an opportunity and encouragement for delay, and a chance to escape payment. The other has been the purpose on the part of certain taxpayers to institute litigation causing delay in collections, so as to embarrass the Treasury until it should be compelled to make a large reduction to cover deficits. The taxes are not excessive. The general property taxes are very much less than one-half of those imposed in the United States. The total tax of 1923, in the United States, including national, state and municipal taxes, amounted to $68.33 per capita. The total taxes which would have been paid by the Porto Ricans if those imposed had been paid, would have amounted to $9.02 per capita.

Trade.—Porto Rico's external trade in 1900 was $16,602,004; in 1925 it had grown to $182,441,458. In 1900, Porto Rico's purchases from the United States amounted to $6,952,114; in 1925 the purchases had increased to $79,349,618. In 1900, Porto Rico sent to the United States products valued at $3,350,577; in 1925 Porto Rico's shipments to the United States were valued at $84,411,792. In 1900, Porto Rico's imports from foreign countries amounted to $3,037,391; in 1925, such imports amounted to $11,154,983. In 1900, Porto Rico shipped to foreign countries her products to the amount of $3,261,922; in 1925 her shipments to foreign countries had increased to $7,525,065.

Education.—The largest item in the annual budget is the appropriation for education. The recent appropriations for the next two years total $10,600,000—about half of the total appropriations for all expenditures of the government. With one-half of the entire population totally illiterate, with tens of thousands of children who are not yet provided with any school privileges whatever, and with more than one-half of the schools conducted in rented rooms unfitted for the purpose, with too few teachers and most of those inadequately prepared, and with insufficient books and apparatus, it has been fully realized that to better these conditions would be the supreme test of the government. At the commencement of the American occupancy, there was practically no public school system in evidence. Between 80 and 90 per cent. of the people could not read and write; 90 per cent. of the population was rural and there were no rural schools whatever. Now over 2,000 rural schools are in operation. The percentage of illiteracy has been reduced almost one-half since 1900.

Sanitation.—There has been a persistent and consistent effort to better health conditions in Porto Rico. The activities of the Department of Health have been greatly extended. In 1902, soon after American occupation, the birth rate and death rate were approximately the same, 26 per thousand. Since then, the birth rate has increased to 37 and the death rate has been reduced to 18. There has been a steady fight waged for the control of Uncinariasis or the hookworm disease. The International Health Board of the Rockefeller Foundation has coördinated its work with the Insular government for the eradication of this disease. Tuberculosis is the most frequent cause of death in Porto Rico.

Commerce and Industries.—Sugar, coffee, tobacco and fruit are the principal crops. A greater acreage is being devoted year by year to the growth of Sea-Island cotton. In 1924, 12,000 additional acres were put in cotton and it was expected that the 1925 increase would be even greater. The exports for the past two fiscal years and the principal crops are shown in the table below:

	1924	1925
Sugar	$47,838,687	$53,261,895
Coffee	4,595,811	3,742,694
Leaf tobacco	12,578,448	9,156,480
Cigars	5,460,119	7,105,508
Fruit	3,807,567	4,202,654
Cocoanuts	616,484	709,853
All others	13,383,424	13,757,773

PHILIPPINE ISLANDS

By Frank McIntyre

Major-General and Chief of U. S. Bureau of Insular Affairs

Political.—Governor General Leonard Wood reports that during the year 1924 he visited most portions of the archipelago including all provinces, larger cities and towns. Generally speaking, he found everywhere a contented people living under steadily improving conditions and surroundings.

In the triennial election held this year the Nacionalistas obtained a large majority in both the Senate and the House of Representatives. Manuel L. Quezon was reëlected President of the Senate and Manuel Roxas reëlected Speaker of the House of Representatives. Sergio Osmeña, President pro tem of the Senate, is in this country as the head of an independence mission of the Philippine Legislature.

Four of the departments are under the direction of the under Secretaries who assumed charge as Acting Secretaries upon the resignation of the Secretaries in July, 1923. Felipe Agoncillo resigned as Secretary of the Interior and was succeeded by Honorio Ventura.

Chief Justice Araullo of the Supreme Court died in 1924 and was succeeded by Justice Avanceña. Attorney General Villa-Real was appointed a Justice of the Supreme Court and Delfin Jaranilla, Judge of a Court of First Instance, succeeded him as Attorney General.

The Filipinization of the public services has continued gradually, due largely to the natural desire of the Filipinos to occupy various offices and especially to the influence of the Act, commonly known as the Osmeña Retirement Act, which permits retirement after 6 years' service with 60 per cent. of a year's salary paid in monthly installments, extending over a period of three years, and retirement after 10 years' service with 1 year's salary similarly paid. This law, in conjunction with the continued agitation concerning independence and the withdrawal of the United States from the Islands, has induced many Americans to accept retirement and seek employment elsewhere. The result has been seriously to handicap the Government, especially in the Department of Public Instruction where the number of American teachers has been greatly reduced. The teachers' pension and retirement law also tends to encourage the retirement of old and experienced Americans.

Finance and Economics.—Business conditions have steadily improved; there has been a marked increase in revenues; the collection of taxes has been better than last year; the balance of trade has been heavily in favor of the Philippines, and trade has been stable. The total increase in revenue for the calendar year 1924 was 9,120,945 pesos (50 cents, gold value), over the revenue of the preceding year. The cost of maintaining the Government was 969,020 pesos less than the preceding year, making a total of 10,089,955 pesos in favor of 1924 as compared with 1923.

The work of the Manila Harbor Board has been largely instrumental in making Manila the best port in the Orient for handling cargo. The new pier is nearing completion and is one of the largest in the world.

Rural Credit Associations have been organized in accordance with acts passed by the Legislature. The Associations have been of the greatest assistance to the small farmers and consequently to the upbuilding of agriculture. The search for petroleum continues thus far without notable success.

The labor supply is adequate for the present state of development of the Island's resources. Many thousands of Filipino laborers have gone to Hawaii in the past few years to work on the sugar and pineapple plantations.

The Bureau of Public Works, besides its maintenance work, has built a few hundred kilometers of first class roads, has completed several reinforced concrete bridges and culverts, has bored 100 artesian wells, and has done other valuable work. There are several unfinished projects under way.

The currency in circulation on December 31, 1924, was 123,979,980 pesos in comparison with 110,389,333 pesos in 1923.

The customs collections in 1924 were 21,364,608 pesos and in 1923 17,058,562 pesos. The balance of trade in favor of the Philippines was 54,668,000 pesos. The principal imports were cotton and its manufactures 49,379,000 pesos, iron and steel 24,094,000 pesos, rice 18,525,000 pesos, mineral oil 17,340,000 pesos, meat and dairy products 9,862,000 pesos, wheat flour 8,042,000 pesos, automobiles, parts and tires 6,484,000 pesos.

Education.—The widespread and keen interest in education continues to be one of the most encouraging features of the Philippine situation. The people are deeply interested in the schools and contribute very liberally to their support. The schools are crowded to their utmost capacity.

General progress in education, however, especially during the last few years, has been in quantity rather than in quality. In a desire to provide school facilities for all children, growth in numbers has received more consideration than the development of real educational efficiency. The system has expanded too rapidly for the best results. Before further expansion there should be a more adequately trained teaching staff, improved supervision, a better curriculum and a longer period during which children are kept in school. The children in the primary and intermediate schools constitute 95½ per cent. of the total attendance.

School Statistics.—The following are the more important statistics in connection with the school system:

Public Schools	*1923-24*	*1924-25*
Primary	6,573	6,534
Intermediate	1,010	1,118
Secondary	85	94
Total	7,668	7,746

In the above schools there were approximately 300 in which there was limited instruction in agriculture.

Annual Enrollment	*1923-24*	*1924-25*
Elementary	1,087,732	1,077,044
Secondary	41,265	49,692
University of the Philippines	5,993	5,540
Private schools, including private universities	69,227	73,246
Total	1,204,217	1,205,722

Teachers (University and Private Schools included)	*1923-24*	*1924-25*
Filipinos	25,451	26,013
Americans	329	326

Calendar Year	*1922*	*1923*
	Pesos	Pesos
Expenditures for public schools	22,068,939	22,202,532

School Year	*1922-23*	*1923-24*
	Pesos	Pesos
Voluntary Contributions	1,191,059	1,354,589

The Legislature appropriated 100,000 pesos for an educational survey which was headed by Dr. Paul Monroe of Columbia University and published a report of several hundred pages. English is becoming more widely used with the passage of time. The difficulty is the efficient teaching of English which requires an adequate staff of American teachers. The University of Santo Tomas is the oldest university under the American flag. It is taking steps to replace Spanish with English in considerable degree.

Sanitation and Health. — Public health conditions continue to improve, and public interest in the subject of good health is increasing. The death rate in 1924 was lower than in 1923, which was the lowest on record up to that time. Comparative figures per thousand are 15.48 as compared to 18.44. Appropriations have been made to aid in the construction of much needed provincial hospitals. The birth rate for 1923 was 34.99 per thousand and in 1924 was 25.47.

Representatives of the Rockefeller Foundation have done important work in malaria control and in establishing methods of laboratory control. The United States Army Medical Research Board has completed valuable and exhaustive studies in the etiology and prevention of dengue fever and has definitely established its mode of transmission and the means of prevention. The application of these discoveries will be of far reaching effect in reducing morbidity from this disease.

The results of the anti-leprosy work are most encouraging. There are 409 negatives in the Culion colony and several hundred more in sight. One hundred ninety-seven former lepers have been sent back to their homes as cured. About 75 per cent. of those under treatment are improved. There are 5,600 lepers in the colony.

Commerce and Industries.—The total imports for 1924 were 216,021,790 pesos as compared with 174,999,494 for 1923. The exports for 1924 were 270,689,325 pesos as compared with 241,505,980 pesos for 1923. The trade with the United States showed an increase of 17 per cent. over that of 1923 and during the same period the trade with Japan showed a decrease of 6 per cent., that with the United Kingdom an increase of 22 per cent., and that with China an increase of 20 per cent. The trade with the French East Indies was more than twice as great as that of the previous year, and amounted to 19,756,000 pesos, an increase of 137 per cent. Trade with Germany also showed a big increase amounting to 9,524,000 pesos in 1924, a gain of 44 per cent. The principal export was sugar which amounted to 31 per cent. of the total exports. The next was hemp, 22 per cent, copra, 11 per cent., and tobacco, 8 per cent. The value of the hats exported almost doubled. Seventy-two per cent. of the exports were sent to the United States and 56 per cent. of the imports were from the United States.

The largest increase in imports was in rice which was an increase of 149 per cent. over the previous year. The Philippine embroidery industry shows a decrease of 26 per cent. over the previous year.

ISLAND DEPENDENCIES

By Frank McIntyre

Major-General and Chief of U. S. Bureau of Insular Affairs

AMERICAN SAMOA

Government.—Governor Bryan reports a prosperous year for American Samoa. When visits were made to villages, the reception of the Governor and his party was in every case most friendly and hospitable. In the past the village of Nuuuli has been the headquarters of disaffection.

The births for 1924 were 277 and the deaths numbered 94. Yaws, ringworm and intestinal parasites are the most prevalent diseases.

The U. S. S. *Ontario* visited Swains Island on May 13, 1925, and United States sovereignty was proclaimed over the Island, in accordance with Joint Resolution No. 75, Sixty-eighth Congress.

Commercial.—The copra production for the year 1924 was 1,750 tons, an increase of 30 per cent. over 1923. The contract price per ton was $92.12 as compared to $82.62 for the previous year. On June 30, 1925, the Bank of American Samoa had a surplus of $8,131.64.

Finance.—A poll tax of $6.00 and a school tax of $3.00 are collected from each of the 2,237 taxpayers. The total school tax, if paid, would amount to only $6,711. The Department of Education was allotted $17,198 for the calendar year 1925.

The estimated revenue for 1925 was $85,740; the estimated surplus from 1924 was $40,000; total $125,740. Customs receipts for the year were $79,565.45 and customs expenditures were $36,981.60.

GUAM

General Conditions.—Captain H. B. Price, U. S. N., Governor of Guam and Commandant of the Naval Station, reports continued progress in the Island. Practically all recommendations made by the Governor last year have been carried out. The recommendation made for citizenship for the natives is renewed. Eleven members of the United States House of Representatives visited the Island for three days, attended a session of the Guam Congress and learned Guam conditions at first hand.

In October, 1924, a typhoon with a heavy rainfall inflicted serious damage. The precipitation was twenty-nine inches in thirty hours. The American Red Cross responded promptly and sent $2,500 to be used in alleviating distress.

The deposits of the bank of Guam amounted to $247,369.99, a small increase over last year.

Population.—The native population number 15,246, an increase of 86 over the previous fiscal year. Non-natives residing in Guam number 543, and the Naval establishment totals 859, giving a population of 16,648 for the Island.

Military training begins with

school boys between the ages of 7 and 16. At 16 they are enrolled in the Active Militia and passed to the Militia Reserve at 21. At 25 they are discharged.

Agricultural and Economic.—The Island subsists, in the main, on the proceeds of copra and the money spent by the Federal Government. Agriculture makes up the difference.

The lack of water over most of the Island during the annual dry season is a serious matter for the farmers. They are being encouraged, with some success, to build for themselves reinforced cisterns, earthquake proof, to hold the water that falls abundantly in the wet season. During the year the Island government has built one such cistern and also a reservoir. Road and bridge building have facilitated the dispatch of farmers' products to market.

Education and Sanitation.—Every child in the schools receives industrial training. The boys take up gardening, carpentry, weaving of aggag and copra making. The girls make lace, sew, cook and weave aggag. Athletics have received a great impetus during the year. This activity has improved the use of English. There are twenty-three schools with 98 teachers and 2,813 pupils. Expenditures for schools were $48,160.73.

Systematic sanitation surveys were made of the large towns with beneficial results. Through health talks and newspaper articles the people are being instructed in sanitary measures. Five lepers are in isolation.

Commerce.—Imports for the fiscal year 1925 amounted to $386,270.12, a decrease of $219,000 from 1924. Exports for the same years were $109,177.72 and $113,754.40, respectively. The balance of trade against Guam in 1925 was $525,162.20, a reduction of $214,467 over the previous year. Imports from Japan in 1925 were $44,456.70, an increase of 82 per cent. over 1924.

VIRGIN ISLANDS

General Conditions. — Governor Philip Williams, pursuant to the recommendation of the Colonial Council of the Municipalities of St. Thomas and St. John and the municipality of St. Croix, created a Department of Agriculture, Commerce and Labor. This department has gathered valuable statistics relative to the various problems which confront the Government.

The population in 1917 was 26,051 and in 1925 was 25,950, many going to the United States during that period.

In August, 1924, a severe hurricane passed over the Islands of St. Thomas and St. John. Great damage was done and relief work was handled by the American Red Cross and a local committee.

Health.—The President made available the unexpended balance of the 1924 Federal appropriation for the water supply system and for rebuilding the Peters Farm Hospital at Christiansted. For this institution $25,000 was appropriated. This hospital was expected to be ready at the close of the year. A twenty-five bed addition to the leper asylum has been allowed. Work on these projects is progressing satisfactorily. The municipal hospital of St. Thomas is now well established.

In general, health conditions for this year may be stated as excellent. The death rate has steadily decreased. The annual average for 1911 to 1917 was 35.4 per thousand population. In 1924 it was 23.1. The infant mortality rate (under 1 year of age) for the years 1911 to 1917 was 320 per thousand. In 1924 it had been reduced to 178.2. The American Red Cross has been of great assistance.

Finance.—Business conditions are steadily improving. There is an increase in trade and in savings deposits. The main source of revenue is the ground and building tax and the export duty on sugar.

During the past year the revenues in the municipality of St. Thomas and St. John were approximately $30,000 greater than the preceding fiscal year. This exceeds the revenues of any fiscal year during the past 15 years. The revenues of the municipality of St. Croix were approximately $30,000 greater than the preceding fiscal year. This exceeds the revenues of 1922 and 1923 and for 1923-1924, but is considerably less than any other recent year. The expenditures of both municipalities (exclusive of water supply, etc.) were considerably less than the preceding fiscal year.

In May, 1925, the Secretary of the Treasury appointed special commissioners to investigate the tax and currency situation in the Islands.

Commerce.—The Governor reports that commercial transportation facilities have not in any way improved during the past year. Very few of the Shipping Board vessels call at the port of St. Thomas; none of those that do call being passenger vessels. It therefore became necessary during the year to again request the President to postpone the application of the coastwise laws of the United States to the Virgin Islands. Four large tourist ships called twice each, bringing 2,750 visitors. It is expected that a new dock will be brought to the Virgin Islands within the next few months. In June, 1925, the Governor placed the United States Immigration Act of 1924 in effect in the Islands.

Agriculture.—The sugar cane area on St. Croix to be harvested in the spring will be 20 per cent. to 25 per cent. more than that cut over the past season. There is a general note of optimism among the planters and a bumper crop is expected.

The pink boll worm cuts down the possibilities in cotton. Sweet potatoes grow easily, also onions. Cattle raising, dairy and beef, looks promising. The rainfall is not sufficient for the best results in agriculture. Total rainfall of 1924 was 49.26 inches. The highest temperature was 90 degrees; the lowest 63 degrees.

Education.—The enrollment in schools, public and private, was 4,410; teachers employed 120. The school system is established on the six, three, three plan; 6 years of primary and grammar school work, 3 years Junior High School and 3 years Senior High School. A municipal dentist is employed in each health center to give free dental work to all school children.

LAND CONDEMNATION

By S. J. Brandenburg

Professor at Clark University

Legal Conditions.—Land condemnation refers to the exercise of the power of eminent domain in respect to land. Under this power, not only land in the corporeal sense, but all easements, privileges, and other incorporeal rights arising from private property in land may be taken for public purposes on the payment of equitable compensation. The existence of the power of eminent domain in the state has been called "indispensable and incontestable"; it is the "offspring of necessity." It is "an attribute of sovereignty, inherent in the state and existing independently of the constitution, and is only affected by the constitution in that certain limitations are placed therein on the exercise of the right." (In re: Niagara, Lockport and Ontario Power Co., 210 N. Y. S. 248.)

The contemplated use of the land to be condemned must be recognized, however, as a public use; in fact, the final test of the validity of the exercise of the power is the public welfare. In a dynamic state, new circumstances constantly arise in which public necessity or public convenience can be served only by resort to the power of eminent domain. The right may be exercised by the state itself, or it may be delegated to a private corporation or individual to whom the state has entrusted the performance of some public duty or function. The corporation, or individual does not have the absolute right, however, but holds it only by act of the Legislature.

Economic and Social Conditions.—Land condemnation has played an important rôle in furthering social changes in recent years. Many states in Central and Eastern Europe, in order to procure the economic and social strength attributed to a wide diffusion of ownership in agricultural lands, have condemned large private estates and re-sold the land in small parcels and on easy, long term payments, to peasant proprietors. In our own country we have long been accustomed to condemnation proceedings as a means to the extension of educational facilities, highways, railways, and other public utilities. The United States Supreme Court has recently held the condemnation of land for a "scenic highway" to be justifiable and valid on the grounds of "public purpose." (Rindge County v. Los Angeles County, 43 Sup. Ct. Rep. 689.) The rapid growth of the movement for city planning and city zoning has brought forth a new aspect of public purpose; so, also, the consolidation of land for public municipal, state, and national parks; for the protection of water-sheds safeguarding municipal water-supplies; for publicly owned forests; and for numerous other beneficial public projects.

Unused Lands.—In many of our states there are thousands of acres of non-arable lands, privately owned; conspicuous among these are the cut-over lands of the older lumber regions. Such lands are not suitable for division into farms, despite the fact that efforts are being made by some of the private owners to locate settlers upon them. With a better comprehension of the appropriate economic utilization of different classes of land, the movement grows to reduce such lands from private to public ownership by means of condemnation; to rescue them from their status as waste and non-productive lands and to re-forest or otherwise utilize them in a beneficial public manner, which private owners, lacking the incentive of near-at-hand profits, will not attempt. Likewise, the power is being used increasingly to restore to public ownership existing forest or mineral-bearing lands, and other natural resources.

Conservation.—Private ownership of such resources means a greater or less degree of exploitation, not only for the sake of present private profits, but to meet the heavy burden of actual year-by-year carrying charges. Thus conservation is promoted through condemnation proceedings—a use of the power to secure a "public benefit" for future generations by restoring to public control resources which should never have been alienated. The necessity for impounding, and for the protection of adequate water supplies for enlarging urban areas, for irrigation projects, for giant power utilization, and the construction of aqueducts, conduits, and other devices for carrying water, or power to the points of consumption appears more conspicuously as a public purpose. Such developments will involve an increasing use of land condemnation proceedings in the immediate future.

Excess Condemnation.—Excess condemnation is receiving increasing attention in the United States. It may be defined as the taking of more land than is needed for the carrying through of the immediate public purpose. For example, condemnation used for widening or straightening streets may leave small, or misshapen parcels in the hands of the several private owners. Such lands, lying outside the limits of the primary improvement, if they remain in control of the original private owners may be utilized, if at all, in a way not in furtherance of the public purpose, or may even detract from it. Hence the condemnation of lands in excess of those needed for the immediate improvement may often be essential to the attainment of the maximum public benefit from the improvement.

Legal Basis.—This device has been successfully used in Europe, particularly in England, but it has been only slightly used in the United States. The courts of some states have held it an unwarranted and unconstitutional extension of the power. A few states have expressly authorized it by constitutional amendment. The Illinois court has recently held (Hunt Drainage Distr. v. Harness, 148 N.E. 44), that the drainage district has power to condemn land outside the district, in order to procure the more complete success of the project. Michigan has held (Rogers v. Breisacher, 204 N.W. 112), that for streets and highways, land of sufficient width to provide for future, as well as present needs of the public, may be condemned.

Tendency to Enlarge the Power.—Clearly, the tendency at the present time, both in statutes and in court decisions, is to enlarge the power of land condemnation in that,—(1) it may be exercised by the governing unit, or delegated to a private corporation, or individual; (2) it has been extended to include roads, bridges, navigation, power, water supply, drainage districts, telephone, telegraphs, and public utilities generally; (3) it may include more than is immediately necessary for the primary purpose. It is justified, or denied, however, solely on the basis of clearly established public benefit to be derived.

WATER RIGHTS AND WATER USES

By S. J. Brandenburg
Assistant Professor at Clark University

Navigable and Non-navigable Waters.—This article is concerned only with rights and uses in *non-navigable* waters. *Navigable* waters have been defined as those having capacity to float the products of regional forests, mines, and farms to market. They are regarded as public highways, and though the property of the state, are subject to the regulations of inter-state commerce. Private property in land exists to the edge of such waters. *Non-navigable* waters include all other inland waters. They are subject to private ownership and control, including the bed of the stream or lake.

The Riparian Doctrine.—The common law defining rights in non-navigable waters was developed in humid regions where water was relatively abundant in comparison to land, and hence was regarded as a mere incident to the land. Water here being regarded as a part of the land, the riparian owners asserted their rights to its use. In practice, these rights were limited to such reasonable use as would not substantially impair the volume and purity of the waters, and so trespass upon the equal rights of other riparian owners. Riparian rights have become so firmly established in the eastern sections of the country that they may not be impaired without compensation, although they may be regulated in the public interest.

The Appropriation Doctrine.—In the semi-arid states of the west, over vast areas, water is the limiting factor of production. It has a scarcity value and can be devoted only to the most highly beneficial uses. The control and use of water determines the control and use of land, as well as the direction and extent of most other economic enterprises. In the humid regions, water, because of its abundance, is an incident to the land; in the arid regions, this relationship is reversed. A system of control and use of waters suitable to one region may be wholly impracticable in a different region. Thus the system of rights of the riparian owner developed under humid conditions is wholly unsuited, for example, to the purposes of irrigation; in consequence it has been vitally qualified or denied entirely in most of our western states.

In these regions, the system of appropriation of rights is prevalent. The doctrine of "appropriation" assumes water to be not an exclusive and integral part of the immediate lands in which it is situated, but to be separable from such lands. In consequence, its use is not limited to lands adjacent to the stream or body of water but may be extended to non-riparian lands,—in fact, to lands entirely outside the water-shed or drainage area. Preference in use is based not on location with respect to source of water supply, but on priority of claim, limited only by reasonably necessary and beneficial use. In substance, the courts regard appropriation valid if there is: (1) intent to apply water to some beneficial use now or in the future; (2) diversion from natural channel by ditch or other conduit, and if destined for irrigation, the land must be properly prepared for its reception; (3) application within reasonable time to some beneficial industry. We may note, too, a growing tendency to regard natural waters as the property of the state, and so not subject to private ownership. This expanding public property concept, however, does not invalidate existing vested rights of appropriators of water who are making beneficial use of it; but it may safeguard the future public interest in this increasingly important commodity.

The Uses of Water.—Where water is scarce, public well-being at times requires that certain uses be given precedence, typically: (1) drinking, for man and beast; (2) domestic cooking, washing, etc.; (3) irrigation, and other agricultural uses; (4) mining; (5) power and manufacturing. While details vary in different states, the general purpose of regulatory measures is that water shall be applied to those uses most beneficial to the people as a whole, and the rights of every appropriator must yield to this public purpose unless he can show material damage from so yielding.

The attention of the country has recently been focussed on the competing uses of limited amounts of water in several dramatic instances.

Owens Valley.—To meet her increasing municipal water needs, the city of Los Angeles constructed an aqueduct across deserts, and over or through mountains, to the Owens Valley, two hundred and fifty miles away. Farmers, already located in the Valley, suffered from depletion of irrigation waters and have invoked the courts and resorted to violence to maintain what they conceived to be their rights to the waters of the Owens River and Lake, under the riparian law dominant in California. The issues are not yet settled.

Interstate Rivers.—Disputes as to the waters of interstate rivers have been frequent and litigation has been carried to the United States Supreme Court. That tribunal has held (Kansas v. Colorado, 206 U. S. 46), that no inflexible rule, conceding monopoly rights to any one state, can be established, but rather, having due consideration to the particular circumstances, the principle of "equitable division" between the rival state claimants shall prevail. In a later case (Wyoming v. Colorado, 259 U. S. 419), the court held that in jurisdictions where the doctrine of appropriation prevails, the priorities of individual users should prevail regardless of the state of residence. By this decision, and for this purpose, state lines are non-existent. At its 1925 meeting, the American Society of Civil Engineers emphasized that approximately 40 per cent. of the annual low water yield of the arid west was essential for irrigation, that this use should take precedence over power uses, and that the power use would benefit in the long run by such a present concession.

Colorado River Compact. — The Federal constitution denies treaty-making power to states, but a state may with "the consent of Congress . . . enter into an agreement or compact with another state." (Const. Art. I, Sec. 10.)

This involves two groups of states, viz., Wyoming, Colorado, Utah, and New Mexico, lying in the head-waters of the Colorado River and its tributaries, and devoted to the production of grasses, cereals, hardy fruits and vegetables; and Nevada, Arizona, and California, lying in the lower Valley, with a warmer climate devoted to the production of cotton, citrus fruits, and early vegetables. The several states in each group differ among themselves in their water needs, and in California particularly there is a rapidly expanding demand for hydro-electric power. While the rival claims of the individual states have not been negligible, the differences between the upper four and the lower three have been the chief cause of the controversy.

In order that economic development may proceed with assurance in all the states concerned the compact provides for the "equitable distribution" of waters on the basis of determined beneficial uses.

Uses are classified as (1) domestic, agricultural, milling, etc.; (2) power; (3) navigation. It should be noted that the first use consumes most of the water so devoted; the second use represents merely a diversion which may not interfere seriously with the first or third use of the same water.

On the basis of an average annual flow at Yuma of 20,500,000 acre feet, 7,500,000 are apportioned to the upper four states and 8,500,000 to the lower three. The equitable claims of Mexico are to be met out of the remaining 4,500,000 acre feet, and any unapportioned residue will be apportioned among the seven states some time after 1963, on the basis of what their needs shall then appear to be.

All of the states concerned have ratified the compact except Arizona. Friends of the measure in Arizona are active, however; and pressure of public opinion in the six ratifying states is strong. Arizona will probably yield to these influences and it is predicted that her approval will be the signal for favorable action on the part of Congress.

Delaware River Compact.—Increasing demands upon the waters of the Delaware River by residents of New York, Pennsylvania, and New Jersey brought this compact into being early in 1925. It provides for the allotment of the waters of the river among the several states concerned; safeguards the flow of the stream against undue diversion for power or other purposes; and protects riparian or other vested rights against future pollution and deleterious encroachments within the drainage area. The relative importance of the uses of the water are stated as: (1) domestic and municipal; (2) sanitation; (3) industry and power; (4) navigation.

The state of New York ratified the compact, March 18, 1925; New Jersey proposed reservations and referred the matter to a special Board which is to report to the 1926 session of the Legislature; and Pennsylvania awaits definite action by New Jersey.

Confusion in Water Rights.—It must be obvious that water rights are far from satisfactorily settled. Conflicting theories and varying demands in the application of these theories under widely differing conditions have caused confusion. The complexity and multitude of claims themselves have added further to confusion. The rights of any individual claimant to the use of water within a given water-shed area are inextricably interwoven with the rights of all other claimants. The adjudication of any particular claim affects the rights of all other claimants within the district. These complexities, together with delays incident to court action, have led to the growth of sentiment in several of the semiarid states to lodge final authority for the determination of disputes in the hands of State Water Boards, or similar specialized administrative bodies. Constitutional amendments looking towards this change in procedure were, however, voted down recently in California and Washington. Moreover, the courts have been jealous of this threatened intrusion on their prerogative as final arbiters of differences among citizens, and recent judicial opinions have declared invalid such expeditious methods as those suggested above. The issue here is one between the impartial, though slow moving, justice of the courts and the efficient, though perhaps arbitrary methods of expert administrators.

There is little doubt but that the adjudication of rights in water will become increasingly important with the passing of the years. Economic development in the arid and semiarid regions intensifies the question there. In all regions, moreover, increasing population with its increasing demands for water for domestic and municipal purposes, the greater liability to pollution of the sources of domestic supply, the continuing advance in the use of hydroelectric power, and the rapidly growing demand for access to the lakes and streams of the country for purposes of recreation imply a more general public concern in the issues involved.

TWELVE MILE AND HOUR RUN LIMITS

By Charles E. Hill
Professor at George Washington University

The Law.—The twelve mile limit is based on the enforcement provisions of the Tariff Act of 1922, and on section 2760 of the Revised Statutes which dates back to an act passed by Congress in 1799 and contains the substance of a British statute. This section permits customs officers to board vessels, if bound for the United States, and to search and examine them within twelve miles of the coast. Under the Tariff Act of 1922 the vessel boarded and searched need not be bound for an American port. If it shall appear that any violation of the laws has been committed whereby the vessel or cargo has been made liable to forfeiture, the boarding officer shall seize the vessel and take her in for adjudication. If a master of any vessel from a foreign port allows merchandise, sea stores included, to be unloaded, transshipped or received within twelve miles of the coast and before the vessel has come to the proper place for discharging merchandise and before he has received a permit to unload, he shall be liable to a penalty twice the value of the merchandise, but not over $1,000, and the vessel and merchandise shall be subject to seizure and forfeiture.

Cases.—During 1925 the enforcement of these provisions has mainly affected vessels laden with liquor. That commodity can be lawfully imported only on a permit issued by the collector of internal revenue. Two examples will show how the law is applied. The *Zeehond,* 4F (2D) 735, was a Dutch vessel with a cargo of liquor carrying papers indicating Halifax as her destination. She was seized between three and four miles off Long Island. The captain had established connections with a bootlegger on shore. Entries in the logbook revealed that Long Island was the real destination of the cargo. The district attorney asked for a decree of forfeiture against the cargo. The court so ordered. The *Muriel E. Winters,* 6F (2D) 466, was a British vessel from the Bahamas, laden with liquor. She permitted the unloading of a considerable quantity within twelve miles of the Texas shore but outside the three mile limit. She was not destined for an American port. The court condemned the vessel and the cargo.

Treaties.—Liquor vessels have anchored accordingly beyond the twelve mile limit, where they have been visited at night by fast motor boats which took the liquor ashore. Secretary Hughes proposed to Great Britain an extension of control by the United States. Great Britain held that such action would be an encroachment upon the freedom of the seas. The decision of the Supreme Court in *Cunard S. S. Co. et al v. Mellon,* 262 U. S. 100, embarrassed British ship owners and facilitated negotiations. The United States made during 1924 a so-called liquor treaty with Great Britain and similar agreements with six other powers: Denmark, Germany, Sweden, Italy, Panama and the Netherlands. A like treaty was negotiated with France which has been approved by the United States Senate; but France has thus far failed to ratify it.

The treaties specify that the territorial jurisdiction of each country is not to be prejudiced. All of the countries agree not to object to the boarding of their merchant vessels by the proper American officers for the purpose of examining the papers and the cargoes within one hour's sail of the American coast. If the liquor is intended to be conveyed by a vessel other than the one boarded, it is the speed of such other vessel that is to determine the distance. If there is cause for belief that the vessel has committed or is attempting to commit an offense against American law, the vessel may be seized and taken into port for adjudication.

Claims.—By the treaty with Great

Britain any claim by a British vessel for compensation on the ground that she has suffered loss or injury through improper visit and search and seizure shall be referred to two persons, one nominated by Great Brittain and the other by the United States. In case of their failure to agree, the dispute is referred to the British American Mixed Claims Commission. In the other six treaties the failure of the two nationals to agree is solved by referring the dispute to the Hague Court of Arbitration. No such claims have as yet been preferred.

Liquors under Seal.—In return for the concession to the United States the parties to the treaties are permitted to have their merchant vessels enter American ports with liquors in their sea stores or cargo, provided such liquors are kept under seal continuously while the vessels remain in American territorial waters.

One Hour Distance.—The trend of judicial interpretation in the district courts is indicated by the following cases. The *Frances Louise,* 1F (2D) 1004, was a Canadian schooner, anchored sixteen and a half miles off Cape Cod, with 3500 cases of liquor taken on board at Havana. One J. D. Stewart visited her, left slips of paper with the number of cases of liquor indicated, and gave instructions that the cases should be delivered to those who offered the duplicate slips. Small boats visited her, delivered the duplicate slips, received the liquor and made for shore. One was the *Katherine B,* which did not have gasoline enough to reach shore. The *Frances Louise* gave her ten gallons. On the way in the *Katherine B.* was seized and she revealed the source of the liquor. Revenue officers went out and brought the *Frances Louise* in to Boston on the assumption that the *Katherine B.* could make the intervening distance from shore in one hour. Subsequent investigation proved that she could not. The court dismissed the contention of the government that the schooner was "trading with the shore" and thereby subjected herself to forfeiture under international law. The schooner was ordered released and the government appealed to the Supreme Court.

Jurisdiction by Treaty.—The *Pictonian,* 3F (2D) 145, was a British vessel, laden with liquor, seized fourteen miles from the American coast but within one hour's sail. The United States court held that the treaty with Great Britain was self executing and needed no further legislation. Held further that the libel need not allege that the ship was committing an offense at the time of the seizure. It was sufficient to allege that the ship was attempting to make contact with an American vessel and to smuggle liquor into the United States. To possess liquor within one hour's sail of the coast with intent to smuggle it was ground for forfeiture of vessel and cargo. Judge Thomas took issue with this decision in *Over the Top,* 5F (2D) 838, on the extension of criminal jurisdiction by treaty. Only an act of Congress could do so. "Certain it is," observed the learned judge, "no part of the criminal law of this country has ever been enacted by treaty."

Previous Infractions.—The *Panama,* 6F (2D) 326, was a British vessel, carrying liquor only, seized 12.1 miles off Galveston on the belief that she could reach shore within one hour. No evidence existed of any violation of law off Galveston. But it was proven that on the way from Havana she had been met by boats from New Orleans and had delivered to them 400 cases of liquor. She was really owned and controlled by smugglers at New Orleans. She had been taken outside the twelve mile limit and more than one hour's sail from shore. But she had made contact with the shore in violation of law. It was held that the treaty did not change the right of the United States to seize, for the violation of law is not limited by any particular distance from shore.

Furnishing Information.—A good arrangement is found in the treaty with Canada, proclaimed July 17, 1925, by which each party upon request will furnish to the appropriate officers of the other information concerning clearances of vessels. Clearances are to be denied if the articles consigned are forbidden importation into the other country. The observance of good faith in enforcing these provisions and their extension to other countries will largely do away with any need for extending the three mile limit.

STATISTICS OF TERRITORIES AND DEPENDENCIES

By James B. Hedges

Professor at Clark University

ALASKA

Area.—The territory has an area of 590,884 square miles.

Population.—Fluctuations in population during the period 1890-1920 are shown by the following table:

1890	32,052
1900	68,592
1910	64,356
1920	55,036

Of the population in 1920, 34,539 were males and 20,497 females; 27,883 were white; 26,558 Indians; 56 Chinese; 312 Japanese; 128 negroes. Chief town, Juneau; population, 3,058.

HAWAII

Area.—The total area of the islands is 6,449 square miles. The principal islands and their area are: Hawaii, 4,015 square miles; Maui, 728 square miles; Oahu, 598 square miles; Kauai, 547 square miles; Malokai, 261 square miles; Lanai, 139 square miles.

Population.—The population of United States census of 1920 was 255,912, of whom 151,146 were males, and 104,766 females. The estimated number of the various nationalities and races on June 30, 1924, was: Hawaiians, 21,271; part Hawaiians, 20,950; Chinese, 24,522; Japanese, 125,368; Portuguese, 26,791; Filipinos, 39,608; Porto Ricans, 6,347; Spanish, 1,932; Americans, British, Germans, and Russians, 34,272; Koreans, 5,817; others, 215.

Principal City.—Honolulu, population, 83,327.

PHILIPPINES

Area.—The group is composed of 7,083 islands, of which only 466 have an area of one square mile, or over. The most important islands are: Luzon, with an area of 40,814 square miles; Mindanao, 36,906 square miles; Samar, 5,124 square miles; Negros, 4,903 square miles; Palawan, 4,500 square miles; Panay, 4,448 square miles; Mindoro, 3,794 square miles; Leyte, 2,799 square miles; Cebu, 1,695 square miles; Bohol, 1,534 square miles; and Mastate, 1,255 square miles. The total area is about 115,026 square miles, of which 92 per cent. is included within the eleven islands named above.

Population.—Total population according to Philippine census of 1918 is 10,314,310, chiefly of Malay race,—91 per cent. of whom are Christians and only 932,953, or 9 per cent., are Moros or pagans. Population of Manila is 285,306, of whom 259,437 are Filipinos; 17,760 Chinese; 1,612 Japanese; 2,916 Americans; 2,050 Spaniards; 664 English; 201 Germans; 121 French; and 71 Swiss.

PORTO RICO

Area.—The area of the island is 3,435 square miles.

Population.—The population in 1920 was 1,299,809; between 1910 and 1920 the population increased by 16.3 per cent. The distribution of the population according to color in 1920 was as follows: white, 948,709; black, 49,246; mulatto, 301,816; Chinese, 32; Japanese, 4; all others (Filipinos and Hindu), 2.

Principal Towns.—San Juan, population 71,443; and Ponce, 41,912.

GUAM

Area.—The length of the island is 32 miles, the breadth from 4 to 10 miles, and the area 210 square miles.

Population.—The population on June 30, 1924, was 15,710, of whom 15,160 were classed as "Natives."

Principal Towns.—Agaña is the seat of government; population, 7,432. Piti, with a population of 429, is the port of entry.

VIRGIN ISLANDS

Area.—The islands consist of the three islands of St. Thomas, St. Croix, and St. John, having an area respectively of 33, 84, and 21 square miles,—a total of 138 square miles.

Population.—The population by the census of November 1, 1917, was: St. Thomas, 10,191; St. Croix, 14,901; St. John, 959,—a total of 26,051.

Principal Towns.—St. Thomas, on island of the same name, population, 7,747; Christiansted and Frederiksted on island of St. Croix, population 4,574 and 3,144 respectively.

AMERICAN SAMOA

Area.—American Samoa consists of the islands of Tutuila, area 54 square miles, and Tau, Ofu, and Olosenga, having a combined area of about 23 square miles. The total area is 77 square miles.

Population.—The population according to the 1922 census was 8,194, of whom 6,125 were on the island of Tutuila. The only good harbor is Pago Pago, where there is located a United States Naval base on forty acres of land acquired by the national government.

PANAMA CANAL ZONE

Area.—Land and water area is 527 square miles.

Population.—The population in 1920 was 22,858, of whom 17,964 were civilians, and 4,884 belonged to the military establishment.

DIVISION VIII

LAW AND JURISPRUDENCE

CONSTITUTIONAL CHANGES IN EUROPEAN COUNTRIES

By Lindsay Rogers
Professor at Columbia University

In Europe during 1925 there were few attempts at constitution making. The new states which came into being as a result of the War had for the most part completed their frameworks of government, and while some of these had to be changed, the day of constituent assemblies had passed.

New Constitutions.—The most important attempt to draft a complete constitution was in Greece and on September 30 the Government issued a decree dissolving and ordering new elections for the National Assembly—a body which had been serving both as legislature and constituent assembly. General Pangalos, the Premier and Secretary for War, declared that the assembly had lost the confidence of the nation; that it was an obstacle to a compromise between opposing political factions, and the complete restoration of normal governmental conditions.

There were, however, in a number of constitutional systems, important developments, either through custom or through ordinary laws, which had the effect of making changes in the political machinery. The most spectacular of these developments were, of course, in Italy and in Spain, where dictatorships govern the countries, sometimes with scant regard for the provisions of constitutions; but in other countries, such as England and France, important questions of public law and governmental organization had to be considered.

ITALY

Electoral Method.—In Italy, Mussolini's proposed reforms were sufficiently far-reaching almost completely to change the character of the government set up by the Italian Statuto of 1848. These changes related to electoral laws, local government, and the position of the Cabinet. The Italian electoral law, forced through by Mussolini in 1923, was one of the most ungenerous to minorities that any political system has ever known. The country was divided into fifteen electoral districts. In each constituency party lists were submitted and voted on, and the votes obtained by each party were added. The party with the largest national total (provided that it was at least 25 per cent. of the total vote cast) was ipso facto the Government. In other words, the entire list of this party was declared successful in every single circumscription, and two-thirds of the seats in the Chamber were assigned to the Government. The representation for the remaining seats was decided in each constituency according to the preferences which the voters there had expressed.

Proposed Plural Voting.—After one election under this law which, as was expected, gave the Fascisti complete command of the Chamber, Mussolini proposed another change. In January last he brought in a new electoral bill which provided for a plural system of voting. The electorate was to be divided into three classes. Adult males unable to read and write or paying less than 100 lire in direct taxes to the State were entitled to one vote. The second class consisted of those who paid more than 100 lire taxes, all members of academies of art, letters and science, teachers in schools, holders of certificates from middle and upper schools, members of Italian orders, officers and non-commissioned officers, holders of civil and military decorations, municipal and provincial councillors, members of provincial and administrative committees, proprietors, editors and managers of daily and weekly papers and journalists enrolled in one of the legally recognized press associations, managers of industrial, commercial and agricultural enterprises and businesses paying a minimum tax of 100 lire yearly, and the fathers of at least five sons who are living or were killed in the War—these were given two votes. Three votes were allowed members of the Royal Family, cardinals, holders of military gold medals, members of the four chief military and civil orders, and state officials, including deputies, ex-deputies, senators, and professors of the Royal universities.

This was much more complicated than the Belgian system of plural voting. It combined the worse features of this with the iniquitous provisions of the Prussian three-class system, and the result would have been to destroy any pretence of universal suffrage and to give the great bulk of the population only one vote apiece in an election, while a comparative few could cast two or three ballots.

Single Member Constituencies.—It was withdrawn by Mussolini almost as soon as it was suggested, and for it was substituted a proposal to revert to the old system of single-member constituencies which obtained before the adoption of proportional representation in 1919. The uninominal scrutiny was agreed to by the Italian Senate last March. The particular point of criticism was a provision permitting retiring deputies to be candidates for reëlection without formality, while new candidates had to present a petition with four hundred signatures. This differentiation was to the obvious advantage of the Fascisti, whose representatives in the present Chamber of Deputies would not have to comply with the same formalities required of possible opponents in the next election. The Senate, nevertheless, approved a law by a vote of 214 to 58.

Local Self-Government.—Extensive reforms in connection with local-self-government were inaugurated. The administration of Rome was put in the hands of a Governor nominated by Royal decree with full power and responsibility for the administration of the municipality. He will be assisted by two Vice Governors, and ten Directors, all named by Royal decree, and by a Commission of eighty persons chosen from the professional and merchant classes. In cities with less than 5,000 inhabitants popularly elected councils have been supplanted by agents appointed by the Government, and there has been considerable administrative reorganization in the direction of putting the national services of education and railroads, telephones, etc., under the direction of the Prefects. While elections were thus being suppressed in 7,000 of Italy's 9,000 municipalities, Parliament granted women the right to vote in municipal elections.

Senate.—The composition of Parliament was also up for consideration. It was first discussed by a Committee of eighteen appointed by the Fascisti Government, and various alternative suggestions were threshed out. This Committee failed to agree. One group proposed to make no change in the Senate, but to have the Chamber of Deputies elected in part on the basis of manhood suffrage, and elected in its other half on the basis of occupation. A second group of the Committee opposed all professional representation, while a single member proposed Senatorial representation based on occupation. This last scheme was adopted for Mussolini's proposals. He did not, however, desire to displace the present members of the Senate (who were appointed for life) but would in time turn the Senate into an elective instead of a life body, and base it on professional representation. These reforms were embodied in a bill introduced in Parliament in November.

Cabinet.—But of most importance was Mussolini's proposal with regard to the position of the Cabinet. The bill prepared in November made the Premier "responsible to the King for the general political direction of the

Government" and extinguished parliamentary responsibility. All Ministers were to be nominated and recalled by the King on the proposal of the Premier who was to direct and coördinate matters in disagreement among them. The number of ministries and their competence was to be determined by Royal decree, and Article IV of the law provided that "The Premier may be entrusted to direct one or more of the ministries by Royal decree." This simply put in constitutional form what already had been the actual fact; for Mussolini has held several portfolios himself at the same time, and has exercised a free hand in reshuffling his Cabinet. Up until July, for example, when he had been in office for 33 months, he had only one associate, the Minister of the Interior, who had retained office from the beginning of the Fascist régime. Sixteen Cabinet members had been dismissed by him for various reasons.

The Premier.—The law extinguishing parliamentary responsibility provided also that no question could be included in the agenda of the Senate or Chamber without the consent of the Premier; that the Premier could ask that any bill rejected by one of the two Houses be voted upon again, and that this could take place by secret ballot without discussion. If upon the measure's reconsideration, the Government proposed amendments, then the discussion would be limited to those amendments. The Premier's salary would be determined by Royal decree instead of parliamentary provision, and in case of his inability to act, his duties would be taken over by a Minister designated by himself.

Parliamentary Responsibility.—Such changes, of course, run completely counter to all developments of constitutional government. In Germany before the War, and more recently in Japan, whose constitution was formed on Prussian and Austrian models, constitutional struggles have been directed to increasing the importance of the legislature vis-a-vis the executive. The attempt was, that is to say, to transform the influence that the legislature might exert through debates into real power over a Cabinet which would be responsible to Parliament alone and not, as previously, to the monarch. The Mussolini proposals in Italy would reverse this development; they would transform a Parliamentary system of responsible Cabinet Government into something resembling the German model or the Japanese adjustment, which incidentally is gradually changing to a parliamentary form, for universal suffrage and the increasing power of Japanese party organizations will make the Cabinets pay more and more heed to the Diet. Responsibility will slowly develop.

A striking change in electoral laws occurred in Japan where the franchise was extended to about 14,000,000 voters. In previous elections hardly 3,000,000 persons have cast ballots. The House of Peers insisted on amending the bill so that the voting age would be increased from 25 to 30, and it was anxious also to exclude from the franchise persons who received either family or public support. This would have limited the number of voters to less than 10,000,000. This amendment was opposed by the Government and the lower house, but a compromise was reached and the House of Peers gave way.

Practically all of the constitutions adopted by the States which were born at the Paris Conference have set up responsible Cabinet Government on the British model, and with additional legislative checks on the executive by reason of interpellations and Committee control during legislative recesses.

SPAIN

The Spanish Directorate also effected extensive changes in the organization of local governments, but the close of the year saw it apparently restore, in part, normal constitutional life. On December 3, a new Cabinet was formed, one-half military men, and one-half civilians. The ministerial declaration declared that "The Constitution will be maintained integrally, but will continue suspended," and the promise was made that the Parliament would be revived. The state of siege had been partially lifted in May. In the Spring of 1925 a new municipal law was promulgated. It granted the right of suffrage to women who were heads of families, reduced the voting age to 23 years, introduced a system of proportional representation, suppressed the Mayors directly appointed by the central government, replaced the right of appeal to the Governor by the right of appeal to judges, and asserted the right of municipalities to conduct their local affairs and to have recourse to the referendum. Political life in Spain, however, has been much more dislocated than in Italy, and General Primo de Rivera was not to be expected to restore the normal régime instantly. It was an interesting fact, however, that the development of his dictatorship seems to tend toward the restoration of Parliamentary government, whereas in Italy Mussolini seems to be using his majority in the Chamber of Deputies to solidify executive dictatorship.

GOVERNMENTAL DEVELOPMENTS IN OTHER COUNTRIES

By Lindsay Rogers

Professor at Columbia University

Dictatorships. — Certain parallels may be drawn between the constitutional aspects of the Spanish and Italian dictatorships. In Spain, the Parliament was completely ignored. The Cortes was dissolved immediately the Directory took office. On the other hand, Mussolini, after the march on Rome, and after he had been entrusted by the King with the duty of forming a ministry, kept the Italian Chamber alive. Perhaps it avoided death only by granting the Premier the right to issue extraordinary decrees without their being based upon specific laws, but the forms of Constitutional Democracy still stood.

In the second place, both dictatorships were brought about with the consent, if not with the tacit approval, of the monarch. Neither the King of Spain nor the King of Italy, that is to say, seemed to object very strenuously to the demand for an extraordinary régime. Perhaps the motive was discretion rather than approval. Perhaps the sovereign saw in each case that resistance might imperil his own position. Whatever the reason, however, it is significant that two such far-reaching revolutions were brought about with the positions of the sovereigns untouched, but with the titular executives relegated to the background, just as they are under parliamentary systems.

The third point that is worth while suggesting is that in Spain the extraordinary régime rested on the Army. Primo de Rivera divided Spain into nine zones of military control. He placed them under the command of Generals upon whom he could depend. Mussolini, on the other hand, built his own forces, and did not rely on the Army. His administrative assistants were non-military officials. This is a much more complex task than a military dictatorship. The latter is comparatively simple, for the organization of control is already in being.

FRANCE

Problems.—Constitutional developments in France related principally to the reorganization of the Cabinet, the position of the Senate, the possible dissolution of the legislature and electoral reform. There was no problem in respect of the presidency. M. Millerand's descent into the political arena, his recall by a majority of the Chamber, which went on a strike and refused to support a Cabinet so long as Millerand was in the Élysée, his resignation and the appointment of M. Doumergue have resulted in the French President being relegated to the position of a titular executive alone. He has reassumed his role of a mute idol in a pagoda, exercising influence perhaps, but limiting his public communications to ceremonial utterances.

Prime Ministers.—For some years an important and unsolved administrative problem in France has been the most efficient organization of the services attached to the presidency of the Council—that is, the office of Prime Minister. In a decree in October, 1925, M. Painlevé settled the matter, and set up a secretariat which will probably be retained by future ministries, but as to this there can be little assurance, since a half dozen adjustments have in as many years been tried and then discarded. Like the British Cabinet when Mr. Lloyd George became Prime Minister in 1916, the French Cabinet had no machinery for preparing agenda, keeping minutes, preserving archives, or communicating decisions which were taken. These were left at lunch time to the memory of each Minister. During the War, following England's example, some beginning was made with Undersecretaries of State and General Cabinet Secretaries, but there were almost as many arrangements as there were ministries.

General Secretariat.—In July, 1924, the Herriot Government set up a General Secretariat which was empowered to coördinate governmental action, to collect information and documents, and to make the studies which were demanded by the President of the Council from the different municipal departments. This office was suppressed in April when Herriot gave way to the Painlevé ministry, but Parliament authorized in its place an Undersecretaryship of State, and the duties of this office have now been regularized and defined in a decree of the French Cabinet. The functionaries attached to the office are divided into three groups which are charged with recording decisions of the Cabinet, preparing agenda and indexing Parliamentary documentation, the study of economic and social questions and liaison with the appropriate Government Departments and the National Economic Council, and the study of administrative questions and liaison with the appropriate Ministers, the Council of State, and the National Defence Council. This organization is more elaborate than the British Cabinet Secretariat, which was greatly reduced in personnel and importance when the Conservative Government took office in 1922. In France the device may be of much use in easing the frequent transitional periods when changes of ministry occur. These changes are frequent; under the Third Republic there have been some seventy ministries which have had an average tenure of nine months. The longest tenure of office was by Waldeck-Rousseau who was Premier from June, 1899, to June, 1902. One of the defects frequently alleged to exist in the French Cabinet system is the ignorance of new Cabinets of what old ones have been doing, and M. Painlevé's decree will make it possible for a permanent secretariat to present to a new ministry such information that this difficulty will no longer exist.

Senate.—The Herriot ministry resigned when it was defeated on April 10 in the Senate by 156 votes to 132 on the question of exceeding the legal limit of the banknote circulation. This brought forward the question of the position of the Senate in the French Parliamentary régime. Cabinet responsibility is incompatible with a bicameralism which does not provide for a weak upper chamber, for a Cabinet cannot serve two masters; it can be responsible to only one branch of the legislature. Thus in countries with Cabinet Government the second chamber is usually less powerful than the lower or more popular body. The French Constitutional Laws make no distinction in the responsibility that the executive has to the two branches of the legislature, but in actual practice Cabinet responsibility has been primarily to the Chamber of Deputies.

On only three recent occasions in the history of the Third Republic has the Senate been a factor in forcing a change of ministry. It dismissed the Bourgeois ministry in 1896, the Briand ministry in 1913, and now the Herriot ministry in 1925. The incident showed that the constitutional theory may prevail over the constitutional practice; that in other words, the Cabinet is responsible to the Senate, although it should be said that in this case the action of the Senate was symbolic rather than decisive. M. Herriot's coalition support in the Chamber was shaking, and he had no backing there sufficient to enable him to make the fight against the upper body. One effect of the incident, however, will be the renewed and intensified unpopularity of the Senate with the Left; for a discussion of the Senate's method of election and its powers has been going on since the Cartel des Gauches made its great gains in the elections of 1924.

On notable occasions in recent years the Senate has held out against the Chamber—on social legislation, the income tax and electoral reform—and the parties of the Left are anxious to follow the precedent in England and reduce it to a state of nonage at the same time that they change its method of recruitment. The difficulty is, however, that there is no agreement on changing the present hybrid form of indirect election, and while the disagreement continues action will be postponed.

DISSOLUTION OF CHAMBERS

General.—Marked Cabinet instability revived the discussion of whether the Chamber of Deputies could not be dissolved before 1928, when its term will expire. It was an interesting fact that several European Parliaments were in 1925 dissolved before the expiration of their terms. Elections were held in Portugal, Jugoslavia and Czechoslovakia (the last case complicated by a dispute with the Vatican), and new Parliaments came into being. In Czechoslovakia there was no relief from the multiple party difficulties for the new Chamber contained sixteen groups and a coalition had to be formed. In Germany in October there was a serious likelihood of a special appeal to the people because of the opposition of certain parliamentary groups to the ratification of the Locarno agreement. In Japan it was likely that party manœuvers would advance the date of consulting the electorate under the new universal manhood suffrage law, and the Australian elections of November 14 resulted from the dissolution of the legislature before the expiration of its term—a dissolution which was the more interesting because a compulsory voting law was used for the first time.

New Plans.—Schemes of dissolution in foreign Constitutions have been of two kinds. In Imperial Germany and even yet in Japan, with the Cabinet not responsible to the legislature, dissolution is a means of punishing a recalcitrant assembly. In systems with responsible government, on the other hand, dissolution is an appeal to popular sovereignty—a solemn referendum. Legislatures hesitate to defeat a Government when they realize that they will thereby face the expensive uncertainty of standing for reëlection.

France.—The French Constitutional Laws provide for the dissolution of the Chamber by the President with the consent of the Senate. This has been done but once—by Marshal McMahon in 1877; and the circumstances of that anti-republican manœuver were such that the whole idea of special dissolutions fell into decided disrepute. During the last year, however, there was much talk of whether France's Cabinet instability could be stabilized by the threat of dissolving the Chamber of Deputies, or whether in view of the temporary party allignments new elections ought not to take place. When the Painlevé Cabinet succeeded the Herriot Government in April, and when the Painlevé Cabinet in turn gave way to the Briand ministry, the newspapers canvassed the possibilities of an election. Between the majority of the Chamber and the majority of the Senate there were irreconcilable discords. How eliminate them, it was asked, except through universal suffrage? But the disrepute into which MacMahon had thrown the idea of special elections prevented any action from taking place, and in December this discussion gave way to a canvassing of the possibilities of a dictatorship which would temporarily subordinate Parliament and would run the country under a régime of administrative decrees.

ELECTORAL REFORM IN FRANCE

Legislative.—The fourth constitutional question that was to the fore in France related to electoral reform. On April 7, the Chamber of Deputies, by a vote of 390-183, passed a bill giving women the right to vote in municipal elections only. Woman suffrage has been a live issue in France, and twice since the War, the Chamber has acted favorably. Each measure has been rejected by the Senate. All the Cabinets since the last election, in May, 1924, have put reform of the election system prominently in their ministerial declarations, for there is general dissatisfaction with the present arrangement, which is a hybrid form of proportional representation. The Chamber is reluctant, however, for Deputies cannot exactly estimate their chances of reëlection if the existing method is changed, and there is hesitancy also because the new method proposed—really the old system of *scrutin d'arrondissement* or single member districts—is one which has always been subjected to a continuous fire of severe but legitimate criticism.

Problems.—With the exception of the relations between Church and State, electoral reform has been one of the most bitterly contested issues in French politics. Single member districts were decided upon in 1875, and lasted until 1885, when a list system was inaugurated with the Department as the district. This, however, was not coupled with any scheme of minority representation. The plurality party in each Department elected the entire delegation for the Department, and in 1889 single member districts were returned to. Discontent, however, did not lessen; of the 597 Deputies elected in 1910 all but 50 declared themselves against the arrondissement and in favor of various list systems, with or without proportional representation. The Senate refused to agree, however, and the War put electoral reform in abeyance. In 1919 the present law was passed. It greatly benefitted the Bloc National in the elections of 1919; it was equally favorable to the Cartel des Gauches in the elections of May, 1924, for a change of one thirtieth of the votes in the country resulted in a change of one third of the seats in the Chamber of Deputies.

Prospects. — There is, however, rather general agreement that the law is a bungling makeshift, and it has few defenders. Numerous attempts have been made to change it. The Senate has several times voted to return to the single-member district, and on June 18 last the Chamber voted for scrutin d'arrondissement by 295-265. Both the Chamber and the Senate seem to be agreed on the principle, and if they can agree on the text of a measure, the prolonged political jockeying will come to an end and the present electoral system will be scrapped. It should be said, however, that single member districts—a device used not unsuccessfully in England and the United States—are subject to disadvantages peculiar to France. The unstable Cabinet system, the centralized administrative organization of the country, and the ability of the Government, through the Minister of the Interior and the Prefects to interfere in elections result in a circle of collaboration between Ministers who want to hold on and Deputies who want to be reëlected. There is a constant rotation of favors which is encouraged by a system of one Deputy for a single small circumscription.

GERMANY

Presidential Election.—The successful operation of the Dawes plan has made it possible for Germany to abandon the extraordinary régimes, the states of siege, and the special financial procedure which have often been in existence since the adoption of the Weimar Constitution. Some difficulties have been experienced with the multiple party system and Cabinet instability. The most important constitutional event of the year in Germany was the presidential election, which took place on March 29 with a run-off election on April 26. A majority of nearly a million votes was cast by republican sympathizers, although Von Hindenburg, an anti-republican candidate, was elected by a considerable plurality. His tenure of office, however, has not been marked by any events which seem to negative in practice the theory of the German Constitution, which is for a titular executive as President—a President, that is to say, who has extensive powers on paper, but who can exercise them only with the consent of Cabinet Ministers responsible to the Reichstag. Presidential power, therefore, can be nothing more than influence. From another point of view, the election of Von Hindenburg was really a gain by the friends of the Weimar Constitution. The man who was the most important symbol of anti-republicanism and a monarchical restoration is put in office and made to support and abide by the forms of a republican framework of government. With their leader sworn to uphold the Constitution and acting loyally under its provisions, those eager for a monarchical restoration will find their propaganda much more difficult.

ENGLAND

Labor.—The most important constitutional questions in England related to the position of labor in the State, but there were several minor problems that were dealt with. On June 11, Mr. Baldwin announced to the House of Commons the creation of a new office—that of Secretary of State for the Dominions. He explained that for the present this portfolio would be held by the Secretary of State for the Colonies, with a separate Undersecretary for each division. The change is made in order to facilitate business with the Dominions, and is also not without significance from the standpoint of the Dominions, since they naturally would prefer to deal through a Secretary for themselves rather than through an officer charged with the supervision of all colonies.

House of Lords.—The House of Lords in May defeated a bill which would have permitted Peeresses in their own right to sit and vote in that Chamber. The Government opposed the measure on the ground that the admission of women to the House of Lords should not be dealt with separately, but should come up as part of a general scheme for the reconstitution of the House of Lords. The Baldwin Government has as yet brought forward no plan for the upper chamber, but it is obliged to do this by its declarations to party meetings and its administration will in all probability not come to an end before a bill is introduced to change the Parliament Act of 1911. It is not likely, however, that the Conservatives will use their tremendous majority to force this proposal through before a dissolution of Parliament and a general election at which one of the issues will be the reconstitution of the House of Lords. On how this should be effected there is no agreement, but it seems likely that a principal issue in the battle between Conservatives and Labor within the next few years will be over the kind of bicameral theory that England shall adopt.

Ratifying Treaties.—On November 18, 1925, the House of Commons ratified the Locarno agreement by passing a motion "That this House approves the ratification of the Treaty of Mutual Guaranty initialed at Locarno on October 16, 1925, and annexed to the final protocol signed on that day." From the constitutional standpoint this was important, since in legal theory foreign policy in England is a matter of executive concern. Treaties or other agreements need not be submitted to the House of Commons before they are ratified. The Labor Government during its tenure of office announced that it would permit a discussion of, and if desired a vote on, every treaty before it became binding, but Mr. Austen Chamberlain on taking office announced that the Conservative Government reserved the right of following a contrary course. The Treaty of Versailles was ratified by Parliament, and the proposed Anglo-American Guaranty to France contained a clause that it would go into effect only after Parliamentary approval. Mr. Chamberlain's action in respect of the Locarno agreement was therefore significant from the constitutional standpoint, and is probably one incident in an increasing share that the House of Commons will assert over foreign policy and international engagements.

Coal Settlement.—The threatened strike of the coal miners in July, and the possibility that the trouble would spread to the railway men and transport workers raised difficult problems for Mr. Baldwin's Government. These were settled temporarily by a Government subsidy to the coal industry in order to avoid reduction of wages, and the appointment of a Royal Commission to discover the facts and to make recommendations for action by Parliament. The solidarity of British Labor which was displayed by this crisis led to an examination of the constitutional powers that the British Government would have in an emergency.

Emergencies.—An important change had been made in the British Constitution in October, 1920, when Parliament passed the "Emergency Powers Act" which permits the executive to declare that a state of emergency exists and then to issue regulations "for securing the essentials of life to the community." Government Departments may be given such "powers and duties as His Majesty may deem necessary for the preservation of the peace" and action may be taken "for any other purposes essential to the public safety and life of the community." Offenders against the regulations are to be tried in courts of summary jurisdiction.

This statutory authority, as is evident, is quite broad. Under it England may have a state of siege. The law was applied during the coal strike of April, 1921, but its powers were sparingly used. After the coal strike last summer was avoided an Organization for the Maintenance of Supplies was created with the approval of the British Home Secretary. The O. M. S. has enlisted volunteers who undertake to maintain and protect the public services in an emergency and to enroll as special constables. The Labor Party has denounced this organization as "the most definite step toward organized Fascism yet made in this country" and Mr. MacDonald pointed out that "private enterprise was being entrusted to maintain order in such a way as to make a breach of order inevitable." Serious constitutional problems, however, are raised by the plans of the trade union movement for concerted action in the event, say, of a coal or railroad strike, and by the efforts of the Government to secure the conduct of essential public services when these are threatened with dislocation by industrial action.

Communists.—In November twelve Communists were convicted on charge of sedition and of "inciting divers persons to commit breaches of the Incitement to Mutiny Act (1797)." That statute had been almost forgotten. In 1797 Parliament had legislated for rather definite perils, and it was the manner even more than the fact of the Communist prosecutions that stirred up controversy over the propriety of the Government's action.

Trade Unions.—One conciliatory action by the Conservative Government in respect to the Labor movement was the decision not to proceed with the trade-union levy bill. This has been introduced by private Conservative members at several recent sessions of Parliament and provides that no moneys may be raised by trade unions for political purposes except through a separate political fund account which must be approved by a majority of the members. No member is to be liable to contribute to the fund unless he gives notice of his desire in writing. At the present time the trade unions raise funds for political purposes through the levy which is imposed unless trade unionists individually object, and these penny contributions are the financial backbone of the Labor Party. Mr. Baldwin and the Government, however, are more tolerant than the rank and file of the Conservative Party, and have prevented consideration of the measure.

CANADA

Among the issues in the Dominion election of October 29 was the future of the Canadian Senate. In recent years the Canadian Senate (which is composed of nominees for life by the Government within the limits set up by law) has rejected several important bills. These resistances have caused the Liberal Party to propose the reform of the upper chamber. Mr. Mackenzie King declared that if his party were successful in the elections it would introduce legislation similar to that of the Parliament Act of 1911 in Great Britain and proposed "that a measure which twice has been supported by the House of Commons shall not be defeated in the Senate on the third occasion it is brought before Parliament." The Canadian Constitution, however, can only be amended by legislation secured from the Imperial Parliament on the joint petition of both Houses of the Dominion legislature, and so long as this is the legal situation, the Senate can prevent impious hands from being laid upon it even if the electorate should seem to speak on upper chamber reform. Therefore it will be considerably delayed, and the defeat of the Liberals in the election of October 29 means that this agitation for a more attenuated bicameral theory will probably subside, at least until new incidents raise it in a more acute form.

IRELAND

The settlement of the Irish Boundary dispute had an indirect constitutional importance. Before the Commission began to function the Government of Northern Ireland had refused to appoint its Commissioner and the question was submitted to the Judicial Committee of the Privy Council as to whether the Crown "acting on the advice of Ministers of the United Kingdom" could instruct the Governor of Northern Ireland to make the appointment. The Privy Council held that the Governor of Northern Ireland could act only "as advised by his Ministers" and there was thus a quasi-legal determination of the theory of Cabinet responsibility and of the inability of the titular executive to act except on the advice of Ministers responsible to his Parliament. Holding as it did, the Judicial Committee of the Privy Council permitted the theory of Cabinet Government to become in a sense part of the constitutional law as well as of constitutional custom.

SELECT DECISIONS ON CONTRACTS

BY H. NOYES GREENE

THE EDWARD THOMPSON COMPANY, NORTHPORT

What Law Governs.—Where the parties to a contract are not residents of the same state they may fix by their agreement whether it shall be governed by the law of the residence of one or the other of them.—(Farm Mortgage, &c., Co. v. Beale, [Neb.], 202 N. W. Rep. 877.)

Offer and Acceptance.—An offer to buy 25 cars of coal answered by an acknowledgment of an order for "25 or as near 25 as we are able to ship" does not form a contract and the buyer having received only 7 cars is not entitled to recover the excess over the contract price which he had to pay for 18 cars in the open market.—(Guyan Coal & Coke Co. v. Wholesale Coal Co., 299 Mich. 257.)

Delivery.—Delivery is ordinarily an essential element to the execution of a written contract. (*a*) Delivery is complete when the contract, being ready for delivery, is handled or sent to the promisee, with the intention at the time to pass the present title. (*b*) A mere manual transition of a paper to the obligee, without mutual intent to give validity to the paper, but with a mutual intent to the contrary, does not constitute delivery. (*c*) Where an instrument is prepared by a vendee or promisee to be signed by three parties, with a request that two of them sign it and then transmit it to the party to be signed by him and returned to the vendee or promisee, and where such third party, on receiving such instrument, declines to sign the same, but instructs his clerk or secretary to return it to the vendee or promisee unsigned, which is done, these facts do not constitute a delivery of such instrument so as to pass title to the property intended to be conveyed thereby to such vendee or promisee.—(Peacock v. Horne [Ga.], 126 S. E. Rep. 813.)

Past Consideration.—The rule that a past consideration which imposed no legal obligation when it was furnished will not support a promise was applied to a promise by an employer to pay to a retiring employee a salary for life in consideration of his long and faithful service, the service having been paid for, so far as legal obligation goes, by the salary paid at the time of his employment.—(Shear Co. v. Harrington [Tex.], 266 S. W. 554.)

Fraud or Mistake—Signature Without Reading.—The courts have had frequent occasion during the past year to reiterate the rule that one who signs a writing without reading it cannot assert fraud or mistake as to its contents if he was in no way prevented from reading it.—(See for example, Widencamp v. Patterson [Ga.], 127 S. E. Rep. 158; Melner v. Earl Fruit Co. [Idaho], 232 Pac. Rep. 581; Brenard Mfg. Co. v. Jones [Ky], 269 S. W. Rep. 722.)

Duress—Threat of Suit.—Where a contractor fails to perform a building contract, and executes a new contract to avoid a suit for breach of the first, he cannot urge that threat as duress avoiding the second contract.—(Irwin v. Weikel [Pa.], 127 Atl. Rep. 612.)

Legality — Influencing Municipal Legislation.—It appears (in Goodrich v. Northwestern Tel. Co. [Minn.], 201 N. W. 290), that a contract was made between a telephone company and some 18 of the leading men of a small city including the mayor and a majority of the city council with respect to telephone rates and service. The contract was made at a time when a rival company was seeking a franchise. It contained the following clause: "In consideration of the concessions made as aforesaid, and in view of the general compromise and settlement of the telephone situation, second parties agree to use all reasonable means to prevent telephone agitation in the city of Anoka and endeavor to secure and cause to be maintained friendly relations between the first party and its patrons." The court held the agreement to be invalid, saying: "Such extraneous secret influence on legislative officials received, perhaps, in the best of faith as coming from a free and untrammeled motive, is dangerous in the extreme. It was, in essence and in effect, against the soundest principles of public policy. This element was not disclosed by the writing itself. Why should the court uphold a contract based upon a secret consideration, which, if known, would tend largely to defeat its purpose? This is the best evidence of the insidious tendency of such agreements. In fact, this should be regarded as a conclusive badge of corrupt motive; not in the sense that there was in fact such, but in the sense that, under such circumstances, the court will not listen to a claim of good motive. Judicial aid will not be given to either party to such an agreement, not because it wants to help either party, but because the agreement is tainted."

Public Policy—Contract to Support Illegitimate.—A contract by the putative father of a child born out of wedlock to support and educate it is not immoral or contrary to public policy.—(Thayer v. Thayer [N. C.], 127 S. E. Rep. 533.)

Statute of Frauds—Sale of Goods Not in Existence.—The statute of frauds applies to the sale of goods not in existence unless they are to be manufactured specially for the buyer. Accordingly the statute applies to a sale of garments to be made, where they are to be of the seller's stock models, suitable for its trade generally.—(Burman Stores Co. v. Hirsch [N. Y.], 240 N. E. Rep. 212.)

Contracts of Infants—Home as Necessary.—As an extension of the rule that lodging is a necessary for which an infant may contract, the purchase by a married infant of a home at a fair and reasonable price and suited to his means and station in life is a contract for a necessary which he is not entitled to disaffirm. —(Johnson v. Newberry [Tex.] 267 S. W. Rep. 476.)

Contract of Infant—Misstatement as to Age.—Misrepresentation by an infant as to his age does not preclude a plea of infancy to avoid a contract. —(J. Pierce & Co. v. Wallace [Mass.], 146 N. E. Rep. 658. To the contrary: Downey v. Northern Pac. R. Co. [Mont.], 232 Pac. Rep. 531.)

Contract of Married Woman—Becoming Surety for Husband.—Where a married woman borrows money from her husband's creditor and pays it to him in satisfaction of the husband's debt she in effect becomes surety for him in violation of a statute forbidding her so to do, and the creditor cannot recover on new obligation to repay the money.—(Vanderslice v. Merchants Bank [Ala.], 104 So. Rep. 663.)

Contract of Employment—Notice of Existence of Strike.—To warrant a conviction of an employer under a statute forbidding advertisement for labor without stating that a strike exists, if such is the fact, it must appear that there was an actual existing strike and if the employer is running his plant at normal capacity and experiencing no difficulty he may be justified in assuming that the strike is at an end though picketing of his premises is kept up. Whether he is so justified is a question of fact for the jury.—(West Allis Foundry Co. v. State [Wis.], 202 N. W. 302.)

Contract of Employment—Bonus.—A promise of an annual bonus on a profit-sharing basis to employees is not without consideration as to employees in service at the time it is made since continuance in the employment may be thereby secured.—(Wellington v. Curran Printing Co. [Mo.], 268 S. W. Rep. 396.)

Sale—Warranty on Sale of Second-Hand Automobile.—On the sale of a second-hand automobile there is an implied warranty that the automobile is in condition to run.—(Crawford v. Abbott Auto Co. [La.], 101 So. Rep. 871.)

Sale of Food—Warranty of Fitness.—There is no implied warranty of fitness for human consumption on the sale of food between manufacturer and ultimate user but there is such a warranty implied in a sale by a dealer to the consumer.—(Pelletier v. Dupont [Me.], 128 Atl. Rep. 186, applying Uniform Sale Act.)

Sales—Warranty on Sale of Hog Cholera Serum.—A seller of hog cholera serum does not impliedly warrant that its use will protect hogs from the cholera.—(Balhorn v. Pilman Moore Co. [Ia.], 200 N. W. Rep. 601.)

Conditional Sales—Liability of Automobile in Hands of Purchaser.—An automobile conditionally sold in one state cannot be seized for the debts of the purchaser in another.—(Tennessee Auto. Corp. v. American Nat. Bank [Ky.], 266 S. W. Rep. 54.) Nor may an automobile so sold be forfeited for illegal use in the liquor traffic if the seller was not privy thereto.—(Edwards v. State [Ala.], 104 So. Rep. 255.)

SELECT DECISIONS ON TORTS

By H. Noyes Greene

The Edward Thompson Company, Northport

Assault and Battery—Acts of Clerk in Store.—A clerk in a store believing that a person has purloined goods therefrom is entitled to do no more than to detain him until an officer can be called, and if he seizes the suspected thief, attempts to put his hand in his pocket and calls him a thief and a liar, he is guilty of an assault and battery for which the proprietor is liable if the clerk is acting within the scope of his employment.—(Piggly-Wiggly Alabama Co. v. Rickles [Ala.], 103 So. Rep. 860. See to the same effect McCrory Stores Co. v. Satchell [Md.], 129 Atl. Rep. 348.) In an aggravated case of this kind it was held that punitive damages may be recovered, and a verdict for $5,600 was sustained.—(McClure Ten Cent Store v. Humphries [Ga.], 127 S. E. Rep. 151.)

Assault and Battery—Punishment by School Teacher.—Where a boy living near the school goes to his home at the close of school and then annoys little girls on their way from school he is, even while on his parent's premises, so far within the jurisdiction of the school authorities that the teacher may at school inflict corporal punishment for the offense and is not guilty of assault in so doing.—(O'Rourke v. Walker [Conn.], 128 Atl. Rep. 25.)

Assault and Battery—Interference with Ku Klux Klan Parade.—Where a parade of members of the Ku Klux Klan dressed in robes and hoods is proceeding down a city street in an orderly manner violating no law and making no offensive demonstration it is unlawful for a policeman to attempt to raise the mask of one of the paraders, and a blow with the fist by another parader, to repel the attempt, is a proper act of self defense.—(Shields v. State [Wis.], 204 N. W. Rep. 486.)

Fire—Liability of Person Owning Premises Where It Started.—One is not liable for fire starting by accident on his premises and escaping to those of his neighbor in the absence of negligence. Reasonable care must be exercised to extinguish such a fire if it becomes a source of danger, and failure in this respect will create legal liability.—(Orander v. Stafford [W. Va.], 127 S. E. Rep. 330.)

Automobiles—Liability of Owner to Guest.—The owner of an automobile owes a duty of reasonable care toward one riding with him as an invited guest.—(Munson v. Rupker [Ind.], 148 N. E. Rep. 169; Marcinowski v. Sanders [Mass.], 147 N. E. Rep. 275; Alley v. Wall [Mo.], 272 S. W. 999; Parewonsky v. Joffe [N. J.], 129 Atl. Rep. 142.)

Liability of Householder—Who Is Invitee.—A person going from house to house to leave coupons entitling the housewives to free samples of a food product is a bare licensee and not an invitee, and must take the premises as he finds them. The householder owes him no duty except to refrain from acts of affirmative negligence toward him.—(Stacy v. Shapiro, 209 N. Y. Supp. 305.)

Stores—Duty to Keep Premises Safe.—The proprietor of a store owes to those entering as customers a duty to use reasonable care to keep the premises safe.—(Chichas v. Foley Bros. Grocery Co. [Mont.], 236 Pac. Rep. 361.)—This duty extends however only to those parts of the store which customers are invited and expected to use.—(Wall v. F. W. Woolworth & Co. [Ky.] 272 S. W. Rep. 730.)

Automobiles—Liability of Owner for Act of User.—In Plaumbo v. Ryan, 210 N. Y. Supp. 225, the court applied a New York statute of 1924 providing that an automobile owner is liable for the negligence of any person using the car with his permission. This statute overturned the previous New York decisions which repudiated the so-called "family purpose doctrine" and held the owner liable only when the car was being used in his business. The statute was construed (Feitelberg v. Matuson, 208 N. Y. Supp. 786), to cover the case of a car operated by a friend of a borrower thereof. The court (in Keller v. Federal Truck Co. [Tenn.], 269 S. W. Rep. 914) applied a recent Tennessee statute which creates a lien on an automobile for damages done by one using it with the owner's permission.

Libel and Slander—Letter of Government Employee to Senator.—Where a United States Senator writes to a District Manager of the Veterans' Bureau asking information as to complaints made with respect to the treatment of disabled soldiers, an answer by the District Manager containing reflections on the maker of the complaint which are relevant to the inquiry is qualifiedly privileged.—(National Disabled Soldiers' League v. Haan 4 Fed. Rep., 2d, 436.)

Automobiles—Duty of Husband to Control Wife's Driving.—It has been held to be a question for the jury whether a husband is negligent in not attempting to prevent his wife, who was driving the car in which he was riding from making an imprudent effort to pass another automobile.—(Johnson v. Newman [Ark.], 271 S. W. 705.)

Restaurant Keeper—Care in Preparation of Food.—A restaurant keeper is under an obligation to use due and reasonable care to prevent any foreign substance from getting into food to be served by him to his customers, and is liable for a failure so to do. It is immaterial that at the time the negligent act was committed the person to whom the contaminated food is ultimately served is unknown and has not yet entered the restaurant.—(Kennedy v. Wong Lin [N. H.], 128 Atl. Rep. 343.)

ADMINISTRATIVE LAW

By H. Noyes Greene

The Edward Thompson Company, Northport

Since procedural matters are so largely controlled by local statute, it is rarely that a state decision thereon is of any general value. The cases here presented are therefore drawn entirely from the decisions of the United States Supreme Court, and in the main confined to administrative law in its broader sense rather than as embracing only mere rules of court procedure.

Jurisdiction—Amount in Contro-

versy.—A phase of the vexed question of aggregating several claims to make up the amount in controversy requisite to federal jurisdiction was settled (in Sovereign Camp W. O. W. v. O'Neill, 45 U. S. S. Ct. Rep. 49.) Some score or more of members of the complainant society had claims against the society, no one of them amounting to $3,000. The society, with appropriate allegations of conspiracy, sued the claimants jointly to enjoin the enforcement of the claim. It was held that more than $3,000 was involved, giving the federal district court jurisdiction, in view of the allegations that the claims were not only groundless but were being urged pursuant to a conspiracy to harrass the complainant society in its business.

Federal Jurisdiction—Suit by Reserve Bank.—A suit by a Federal Reserve Bank, authorized by and incorporated under the laws of the United States (see Fed. Stat. Ann. 1918 Supp. p. 470), is one arising under the laws of the United States of which the Federal district courts have jurisdiction.—(Sowell v. Federal Reserve Bank, 45 U. S. S. Ct. 528.)

Jurisdiction Auxiliary to Mortgage Foreclosure.—The power of a court which has jurisdiction to foreclose a mortgage on corporate property to adjust other claims against the property was declared (in Central Union Trust Co. v. Anderson County, 45 U. S. S. Ct. Rep. 427). In that case the United States District Court, having foreclosed a mortgage on a railroad property was about to direct a sale and the execution of a deed when it appeared that certain parties had claims against the railroad property whose assertion would jeopardize its future operation. The Supreme Court held that the lower court had power to try the validity of these claims by proceedings ancillary to the foreclosure suit and if they were found to be groundless to decree the sale free and clear of them.

Review of Official Decisions—Federal War Risk Insurance.—(In Silberschein v. U. S., 45 U. S. S. Ct. Rep. 69), it was sought to review in the federal courts a ruling of the Director of the Veterans' Bureau reducing an award to nothing. The Court in refusing to review the facts said: "In the light of the prior decisions of the court we must hold that his decision of such questions is final and conclusive and not subject to judicial review, at least unless the decision is wholly unsupported by the evidence or is wholly dependent on a question of law or is clearly arbitrary or capricious."

The Federal Labor Board—Its Decisions Unenforcible.—It was for some time thought that the Federal Labor Board created as part of the Esch-Cummins Act of Feb. 28, 1920 (see Fed. Stat. Ann. 1920 Supp. p. 87) had in it at least the germs of a solution of the labor problem as applied to interstate carriers, giving a compulsory forum in such matters. At least one threatened strike was averted by virtue of that interpretation. But it has been established by two authoritative decisions of the current year that the decisions of the Board possess no binding force and cannot be enforced by federal injunctive process.—(Penn. R. Co. v. Labor Board, 261 U. S. 72; Federation No. 90 v. Penn. R. Co., 45 U. S. S. Ct. Rep. 307.) The court said in the case last cited that the act may be searched in vain for "any intimation that the disputants in the controversies to be anticipated were in any way to be forced into compliance with the statute or with any judgments pronounced by the Labor Board except through the effect of adverse public opinion."

Creation of Presumption by Legislature.—An interesting application of the power of the legislature to create prima facie presumptions of fact which shall be binding on the courts is found (in Cockrill v. California, 45 U. S. S. Ct. Rep. 490), upholding a provision of the California Alien Land Law providing that when an alien ineligible to citizenship provides the consideration for a conveyance to one entitled to hold realty it shall be presumed that the conveyance was made with intent to avoid escheat.

Judicial Notice—Decreased Purchasing Power of Money.—The Supreme Court declared in (Banton v. Belt Line Ry. Corp., 45 U. S. S. Ct.

Rep. 534), that "it is well known and the court will take judicial notice of the fact" that the purchasing power of money is much less than in 1917.

Rules of Court—In Bankruptcy.—The power granted to courts of bankruptcy to prescribe such rules as are necessary to carry the act into effect, given by section 30 of the Bankruptcy Act (see 1 Fed. Stat. Ann. p. 852), was sharply limited by the decision (in Meek v. Centre County Banking Co., 45 U. S. S. Ct. Rep. 560), holding that this section does not allow a rule which is in effect one of substantive law, such as a rule allowing less than all the members of a partnership to file a petition against the firm without the consent of the others.

Pardon—In Contempt Cases.—The question, much discussed and never before authoritatively decided, of the power to pardon one committed for contempt of court, was settled in (Ex parte Grossman, 45 U. S. S. Ct. Rep. 332). The court held that the President has power to pardon for a "criminal" contempt viz. one whose gravamen consists in the defiance of the lawful powers of a court, but not for a civil contempt consisting of the violation of an order made for the benefit of a party. The specific contempt as to which the power to pardon was sustained was the violation of an injunction against the maintenance of a "liquor nuisance" issued under the provisions of the Volstead Act.

Jury Trial in Contempt.—It was held (Michaelson v. U. S., 45 U. S. S. Ct. Rep. 18) that though the power to punish for contempt is inherent in courts of record, that power is not infringed by the provision of the Clayton Act (Act Oct. 15, 1914, sec. 22, 6 Fed. Stat. Ann. p. 140), giving a right to demand a jury trial in cases of contempt growing out of violation of an injunction issued in labor disputes where the act charged as a contempt also constitutes a criminal offense under the laws of the United States or of the state where the act was committed. The decision is carefully confined to the precise point at issue and cannot be said to be an authority for the proposition that all contempt cases may be made triable before a jury though the reasoning of the court would seem to point in that direction. Incidentally, it was held that the provision of the Clayton Act for a jury trial is mandatory.

Witnesses—Privilege Against Self Incrimination. — The constitutional protection of witnesses against self incrimination applies in civil as well as criminal proceedings, and is applicable to a bankrupt undergoing examination as to his assets. It does not, however, relieve him from the duty imposed by the Bankruptcy Act of surrendering his books and papers, these being part of his estate (McCarthy v. Arndstein, 45 U. S. S. Ct. 16). The court said in conclusion: "If Congress should hereafter conclude that a full disclosure of the bankrupt estate by the witnesses is of greater importance than the possibility of punishing them for some crime in the past, it can as in other cases confer the power of unrestricted examination by providing complete immunity."

IMPORTANT LEGISLATION

By H. Noyes Greene

The Edward Thompson Company, Northport

Federal Legislation. — The sixty-eighth Congress closed its second session on March 4, 1925. Its record was not one of notable achievement, most of the legislation being either routine or departmental. Of the numerous bills which became laws only five seem to deserve emphasis, viz.:—

"The Arbitration Act," making valid and enforcible written agreements for the arbitration of disputes arising out of contracts, maritime transactions or commerce among the States or Territories or with foreign nations.

"The Corrupt Practices Act," regulating expenditures by candidates for Congress.

"The Air Mail Act," designed to encourage commercial aviation and to authorize the Postmaster General to contract for air mail service.

An Act providing for the establishment of a probation system in the United States courts.

An Act reclassifying the salaries of postmasters and employees of the Postal Service and in general increasing the pay of postal employees.

UNIFORM STATE LEGISLATION

Decided progress was made in the year 1925 toward the accomplishment of uniformity of law among the States and Territories. There were fourteen adoptions in the various jurisdictions of Uniform Laws prepared and approved by the National Conference of Commissioners on Uniform State Laws. In addition, certain Conference amendments to the Uniform Sales Act and the Uniform Warehouse Receipts Act were adopted in three different states. The National Conference held its thirty-fifth annual meeting on August 25 and promulgated four new Acts as follows: Uniform Arbitration Act; Uniform Interparty Agreement Act; Uniform Joint Obligations Act; Uniform Written Obligations Act. Naturally none of these new acts has yet been adopted by the States, with the exception of the Arbitration Act, which was adopted by Nevada prior to its final approval by the Conference. In addition to these four new acts, the Conference is responsible for 30 Uniform Laws, the present situation with respect thereto being shown in the following tabulation:

Uniform Sales Act.—No adoptions in 1925, but Ohio and Wisconsin adopted the amendments to sections 32 and 38 of the act approved by the National Conference in 1922. Iowa and New York also amended the Act in other respects. The Act is in force in 27 jurisdictions.

Uniform Conditional Sales Act.—Adopted by Pennsylvania and reënacted by West Virginia in 1925. The Act is now in force in nine jurisdictions.

Uniform Warehouse Receipts Act.—No adoptions in 1925, but Ohio and Wisconsin adopted the amendments to sections 20, 40 and 47 of the Act approved by the National Conference in 1922, and Idaho adopted the Conference amendments to sections 20 and 47. The Act is in force in all jurisdictions but Georgia, Hawaii, Kentucky, New Hampshire and South Carolina.

Uniform Bills of Lading Act.—No adoptions in 1925. The Act is in force in 25 jurisdictions.

Uniform Negotiable Instruments Act.—Idaho amended section 5 of the Act in 1925. Georgia having finally adopted the Act in 1924, it is now in force in every jurisdiction but Porto Rico.

Uniform Stock Transfer Act.—Tennessee reënacted the Act in 1925 to cure a defect in the title, and Michigan amended section 15 to cure an error therein. The Act is in force in 18 jurisdictions.

Uniform Partnership Act.—No adoptions in 1925. The Act is in force in 16 jurisdictions.

Uniform Limited Partnership Act.—South Dakota adopted the Act in 1925 and Massachusetts amended section 2. The Act is now in force in 14 jurisdictions.

Uniform Desertion and Nonsupport Act.—West Virginia reënacted the Act in 1925, and Massachusetts and Vermont made certain amendments thereto. The Act in more or less modified form is in force in 24 jurisdictions.

Uniform Acknowledgments Act.—No adoptions in 1925. The Act is in force in Louisiana, Massachusetts, Michigan and Tennessee.

Uniform Acknowledgments Act, Foreign.—No adoptions in 1925. The Act is in force in Alaska, Louisiana, Maryland, Nevada, New Hampshire, Tennessee and Wisconsin.

Uniform Aëronautics Act.—Idaho and South Dakota adopted the Act in 1925. Although approved by the National Conference only in 1922, the Act is now in force in 10 jurisdictions.

Uniform Child Labor Act.—No adoptions in 1925, but Massachusetts made certain amendments thereto.

The Act is in force in Delaware, Kentucky and Massachusetts.

Uniform Cold Storage Act.—No adoptions in 1925. The Act is in force in Illinois, Maryland, Massachusetts, Tennessee, Utah and Wisconsin.

Uniform Declaratory Judgments Act.—South Dakota and Utah adopted the Act in 1925. It is now in force in 8 jurisdictions.

Uniform Extradition Act.—No adoptions in 1925. The Act is in force in 8 jurisdictions.

Uniform Fiduciaries Act.—Idaho, Utah and Wisconsin adopted the Act in 1925. It is now in force in 9 jurisdictions.

Uniform Flag Act.—No adoptions in 1925. The Act is in force in 9 jurisdictions.

Uniform Foreign Depositions Act.—No adoptions in 1925. The Act is in force in 10 jurisdictions.

Uniform Fraudulent Conveyance Act.—New York and Utah adopted the Act in 1925. It is now in force in 14 jurisdictions.

Uniform Illegitimacy Act.—Iowa and New York adopted the Act in 1925. It is now in force in 6 jurisdictions.

Uniform Land Registration Act.—No adoptions in 1925. The Act in modified form is in force in Georgia, Utah and Virginia.

Uniform Marriage and Marriage License Act.—No adoptions in 1925. The Act is in force only in Wisconsin.

Uniform Marriage Evasion Act.—No adoptions in 1925. The Act is in force in Illinois, Louisiana, Massachusetts, Vermont and Wisconsin.

Uniform Occupational Diseases Act.—This Act has not been adopted in any jurisdiction.

Uniform Proof of Statutes Act.—No adoptions in 1925. The Act is in force in 7 jurisdictions.

Uniform Vital Statistics Act.—Arizona adopted the Act in 1925. It is also in force in West Virginia.

Uniform Wills Act, Foreign Executed.—No adoptions in 1925. The Act is in force in 10 jurisdictions.

Uniform Wills Act, Foreign Probated.—No adoptions in 1925. The Act is in force in Illinois, Louisiana and Wyoming.

Uniform Workmen's Compensation Act.—No adoptions in 1925. The Act in more or less modified form is in force in Hawaii, Idaho and Vermont.

OTHER STATE LEGISLATION

Among the mass of statutes enacted by more than forty state legislatures meeting in regular session in the year 1925, it is difficult to observe any general trend of legislation or to pick out laws having other than local interest. Mention may be made of a very few, as follows:

Constitution.—Acts providing for the teaching of the United States Constitution in the schools or otherwise designed to promote patriotism and Americanization were adopted in Arizona, Colorado, Connecticut, Indiana, Kansas, New Jersey, Oregon and Wyoming.

Bible.—Acts providing for Bible reading in the public schools were adopted in Delaware and Idaho.

Sterilization.—Acts providing for the sterilization of feeble-minded or criminal persons were adopted in the states of Idaho, Minnesota, Oregon and Utah.

Miscellaneous.—Other subjects receiving more than usual legislative attention were Blue Sky securities, Coöperative Marketing, Gasoline taxes, Unlawful Searches and Seizures, and Zoning.

PROHIBITION ENFORCEMENT

BY F. ERNEST JOHNSON

EXECUTIVE SECRETARY, FEDERAL COUNCIL OF CHURCHES OF CHRIST IN AMERICA

Enacting Measures.—National prohibition in the United States exists through interrelated measures: first, the Eighteenth Amendment to the Constitution, which became effective January 17, 1920, after being ratified by decisive, and in most cases overwhelming, majorities in 46 States; second, the National Prohibition Act (the Volstead Act) which became law also on January 17, 1920. The Volstead Act had been vetoed by President Wilson, but was passed immediately over his veto. Third, this act was amended on November 23, 1921, by the Willis-Campbell Act, which strengthened certain of the enforcement features.

The Eighteenth Amendment prohibits the manufacture, sale and transportation of intoxicating liquors for beverage purposes within territory subject to the jurisdiction of the United States, and all importation or exportation thereof for such purposes. The National Prohibition Act defines an "intoxicating" liquor as one containing one-half of 1 per cent., or more, of alcohol. This act was upheld by the Supreme Court, June 7, 1920, two justices dissenting from the opinion.

A marked reduction in the consumption of liquor between 1917 and 1920 was due to wartime restrictions placed on the manufacture of liquors, in the interest of food conservation, and also to the operation of the Wartime Prohibition Act which was at least nominally in force between July 1, 1919, and January 17, 1920.

Previous State Action. — These three measures were not abnormal or revolutionary. Prior to the ratification of the Eighteenth Amendment the liquor traffic had been progressively curtailed by state action, including both state prohibition laws and the exercise of local option by political units within the states. Thirty-three States and the territories of Alaska, Porto Rico and Hawaii had already passed prohibition laws—five states in 1918, four in 1917, four in 1916, five in 1915, five in 1914, and the rest in earlier years. Prohibition had been enacted by Congress for Indian reservations, for the District of Columbia and for the army. It is estimated that at the time national prohibition took effect 68.1 per cent. of the population of the United States was living in dry territory. The remaining 31.9 per cent., however, included the largest and most heterogeneous population centers, which offer much more difficult enforcement problems.

The Eighteenth Amendment gives concurrent power of enforcement to Congress and to the states, and 47 states have passed laws more or less stringent in support of the National Prohibition Act. Maryland alone has declined to pass such a law, although Maryland was one of the first states to ratify the Eighteenth Amendment; but the New York statute was repealed in 1923 and the Nevada statute has been declared unconstitutional, for purely technical reasons, by the Supreme Court of that state, leaving 45 in force.

Federal Enforcement Machinery. —Federal enforcement of prohibition is lodged in the Treasury Department, under the Bureau of Internal Revenue. The enforcement organization is known as the Prohibition Unit and is headed by the Commissioner of Prohibition. The Department of Justice is responsible for the trying of cases arising under the law, but the gathering of evidence is the responsibility of the Prohibition Unit.

Enforcement of prohibition has become one of the major tasks of the federal government, due to the extensive development of an illicit liquor industry which has now acquired extensive proportions. The present year, 1925, has brought a generally recognized crisis with reference to prohibition, and a complete reorganization of the enforcement machinery and program of the federal government has been effected in order to meet the situation. The major features of the reorganization are as follows.

Reorganization.—Supervision of enforcement has been placed in the hands of a newly appointed Assistant Secretary of the Treasury, who, while without statutory authority, has by administrative action been given executive responsibility. This arrangement brings the whole procedure of enforcement directly under the eye of the Secretary of the Treasury and the President. Along with this centralization of authority, so far as the higher officials of the government are concerned, has gone a decentralization of responsibility throughout the enforcement organization. Previously, there was a dual organization—a body of prohibition agents assigned to state directors, and a "mobile force" of agents working independently of the state directors and under "divisional chiefs." Close supervision of all these officers was maintained by the headquarters organization at Washington. The new plan places the agents under district administrators who have full responsibility for the administration of the law in their districts. Each administrator is given a free hand and is held accountable for results. The plan is simpler than the previous one and is intended to increase responsibility and expedite procedure. Its inauguration has been characterized by emphasis upon efficiency, preoccupation with the more important cases, elimination of propaganda, and increasing independence of influences in the congressional lobby.

Concurrent Jurisdiction.—The present year has also witnessed an increasing emphasis upon the distinction between the functions of the federal and state governments with reference to prohibition enforcement. Hitherto there has been little effort to define these functions. The Coolidge administration is insisting upon the natural limitation of federal action and authority and the necessity of preserving the responsibility of local governments. The trend of political thought and practice in America is manifestly anti-federal and it is seriously affecting the popular conception of the federal government's duties with reference to prohibition.

This political trend has been strongly supported by cumulative experience in the enforcement of the National Prohibition Act. It has been found that the resources of the federal government in administrative and judicial machinery are sufficient to cope successfully only with what may be called the "wholesale" aspects of the enforcement problem—smuggling, the withdrawals of bonded liquors, the diversion and conversion of industrial alcohol to beverage uses, interstate transportation of liquors, and the major conspiracies to violate the law, some of which are of giant proportions. The restraint of these activities is almost exclusively a federal task. But the "retail" phase of the problem is coming to be regarded as only incidentally a task for the federal government. For this, state and local officials must be responsible.

This distinction is accentuated by the operation of our dual system of government. By the provisions of the Federal Judicial Code, cases arising under the Volstead Act, except in the abatement of nuisances, must be brought in a federal court, and all federal cases are tried, if at all, by jury. Thus, the administration of the police phases of the prohibition law becomes exceedingly difficult where offenses are very numerous, save as full coöperation is given by state and local officials. Where, as in New York and Maryland, there is no state enforcing statute, the administration of the National Prohibition Act is hampered to an almost fatal degree.

Smuggling.—The two most difficult tasks of enforcement so far as the federal government is concerned are the elimination of smuggling and the control of industrial alcohol. The former is not considered to be so important an element in the situation from a quantitative point of view as it is from the political and moral point of view. Prior to the present year all efforts at breaking up "rum row" on the Atlantic seaboard were inadequate and almost futile, chiefly because the Coast Guard was so poorly equipped for the purpose. During the spring and summer of 1925, by means of new equipment secured through a special appropriation by Congress, a vigorous attack was made on the smuggling fleet off Long Island and the New England coast, which resulted in a considerable curtailment of smuggling operations.

The value of liquors smuggled into the United States has been estimated by a government expert at $40,000,000 in 1924. There is, however, no basis for accurate judgment in this matter. The importation of liquors into island territory adjacent to the United States rose to a startling figure following the adoption of prohibition by this country, and the inference from this is clear. Canada has also furnished large quantities of liquors to the United States in violation of our laws. The smuggling of whiskey into New York from Great Britain became an international scandal as did the operations between Cuba and our southern Atlantic ports. Treaties have now been negotiated with a number of countries which are aiding materially in checking this illicit flow of liquor. The problem, however, seems not yet to have been solved with any degree of conclusiveness.

Industrial Alcohol.—The problem of industrial alcohol arises from the fact that great impetus has been given to the alcohol industry during recent years by a growing legitimate demand. The National Prohibition Act charges the Bureau of Internal Revenue not only with the prevention of traffic in alcoholic beverages but with the fostering of the industrial alcohol industry. Enormous quantities of alcohol are regularly denatured according to special formulæ many of which do not preclude subsequent conversion by illicit processes into beverage alcohol. The industry is controlled through a permit system and many abuses have arisen in connection with it.

Cereal Beverages.—The manufacture of cereal beverages, involving as it does the manufacture of "high-powered" beer and a subsequent dealcoholizing process to bring the product within the legal limit of alcoholic content, has also caused the government much difficulty. The Treasury Department has now worked out a plan which is awaiting congressional action whereby, through a nominal tax on the product, the cereal beverage plants will be open to inspection and consequently subject to control.

Home Brew.—The extent of small-scale manufacture of "moonshine" and "home brew" no one can estimate. Home manufacture for home consumption has been very generally disregarded by the government, although such manufacture is illegal if the product is not a "non-intoxicating fruit juice." The one-half-of-one-per-cent. rule does not apply here and there is no criterion of illegality for purposes of enforcement. It seems clear, in any case, that with increasing effectiveness of federal enforcement and the gradual shutting off of major sources of supply the ultimate test of prohibition will appear in the ability of a "cellar and attic" industry to maintain itself. The real strength of the demand for illicit liquor will then be measurable.

Social Effects.—A number of attempts have been made during the year to appraise the prohibition régime from a social point of view and to determine the trend of the social consequences of the enactment of the prohibition law. It is generally agreed that as measured by crime statistics (especially, arrests for drunkenness), prison population, deaths from alcoholic diseases, cases of alcoholic psychosis, the rate of dependency due to alcoholism, etc., the early salutary effects of prohibition, which were very marked, have suffered a considerable reduction. The reaction is very apparent in statistical records from 1920-1923 inclusive. Figures for 1924 are in general more favorable. In particular, the death rate from alcoholism for the registration area (which now includes 38 states) has, according to incomplete tabulations of the Census Bureau, declined during 1924 for the first time since 1920. It does not yet appear, however, whether on the whole the crest of the reaction has been reached.

Causes of Reaction.—The reasons for the anti-prohibition reaction are, presumably: (1) the gradual development of a powerful, well financed and highly resourceful illicit liquor industry, whose development has required several years; (2) the tendency of those elements in the community that were chiefly responsible for the adoption of prohibition to regard the task as accomplished with the enactment of the law and to neglect the supporting activities of moral education and the organization of sentiment; and (3) the psychological revolt on the part of large numbers of people who have grown restive and rebellious under the restrictions of the law.

Favoring Prohibition.—It is important to note that while the enforcement of prohibition presents a country-wide problem, there are many sections in which it has already been reduced to manageable proportions and where the question is without doubt a closed issue. Moreover the great social, economic and industrial benefits resulting from prohibition are generally admitted, and the passing of the saloon is almost universally acclaimed as an undoubted boon. While it is quite impossible to measure the effect of prohibition upon business conditions or upon living conditions generally, because so many other potent influences have been operative during the post-war period, the fact that such salutary effects have been experienced by the nation at large is abundantly attested.

Evidences of Public Sentiment.—Controversy is continually going on as to the trend of public sentiment with reference to the prohibition régime. Certain indications are furnished by the success and failure of specific legislative proposals at Washington and in the states. Indiana, which is regarded as one of the states in which prohibition sentiment is strongest, enacted early in the year a "bone dry" law containing more drastic provisions than those of the Volstead Act. The majority was but 8,983, but it reversed a previous "wet" majority of 103,876, and therefore on the face of the returns represented a distinct gain in "dry" sentiment.

As for Washington, each Congress since national prohibition was adopted has been notably "dry" and no efforts to "liberalize" the National Prohibition Act have been taken seriously, while a number of measures designed to make enforcement more effective have been passed. Thus the trend of political sentiment, as measured by legislation, appears to be in the direction of maintaining and enforcing prohibition.

The 69th Congress gives some evidence of a tendency to consider more seriously proposals to modify the law. At the present writing, however, there is no indication that the increased intensity of debate reflects a change in potential voting. Nevertheless, there are reasons to believe that public opinion has not been unaffected by the crisis over prohibition enforcement. The dissatisfaction manifests itself chiefly in a widespread feeling that the flagrant disregard of the prohibition law is breaking down respect for law and government generally. An effort will be made by supporters of the Volstead Act to make the Prohibition Unit an independent bureau in the Treasury Department and to place all prohibition agents under the civil service.

Cost of Enforcement.—The cost of federal prohibition has been the subject of much dispute and many plainly excessive estimates have been given. Excluding the cost to the states, which cannot be properly charged against federal prohibition, and the expenditure of the Department of Justice on account of the Volstead Act, for which there is no special appropriation, the administration of the law is costing the United States for the fiscal year 1926, $19,319,817. This amount includes appropriations for the Prohibition Unit and that portion of the Coast Guard's operating expense that is chargeable to the suppression of smuggling.

Moral Question.—It is generally agreed that the problem of prohibition is mainly a moral and political problem, since the economic and industrial benefits of the outlawing of the liquor traffic are clear. And there is also a growing consensus among the friends of the prohibition régime that if it is to be made increasingly effective there must be a new emphasis upon social and moral education in order that the legislative reform may find permanent support in the thinking and the practice of the people. The emphasis is shifting from enforcement to observance.

PART THREE
GOVERNMENTAL FUNCTIONS

DIVISION IX
PUBLIC RESOURCES AND PUBLIC WORK

PUBLIC LANDS

BY WILLIAM SPRY

COMMISSIONER OF THE GENERAL LAND OFFICE

It is likely that only an occasional person could be found who would admit ignorance of the fact that the expense of running the affairs of this big nation is met by funds derived from taxation, direct or indirect, as everybody either pays taxes or hears others complain about having to pay them. Few recognize that the greatest national asset is the public domain.

General Disposition.—The public lands, in a restricted sense, are those only which are subject to disposal under the various acts of Congress, to which reference will be made; but in order to realize the part they have played in the development of this country, one must know that the early frontier was pushed forward till it was practically obliterated by those of pioneering instinct who sought free homes on the public domain or to wrest wealth from its natural resources. They established the settlements that became towns and towns that developed into cities. Out of the public lands have been created and reserved the great national forests, with an aggregate area of more than 180,000,000 acres, the wonderful national parks covering over 11,000 square miles, and more than 2,500 square miles embraced in national monuments perpetuating natural wonders, comprising a boundless field for recreation and educational research. Other thousands of acres have been devoted to reserves for the protection of birds and game.

In addition to the vast area that has been dedicated to public use and the conservation of natural resources, hundreds of millions of acres have been disposed of at cash sale, the earliest method of disposition, under: the preëmption law, which was the first provision to encourage actual settlement on the public lands; the homestead laws which followed and later superseded the preëmption acts; the timber and stone law for the disposal of lands chiefly valuable for timber or stone; the desert land law for the reclamation of arid lands by individuals; the mining laws; grants to encourage the building of railroads and wagon roads. To the States went the swamp lands within their boundaries and other lands for the support of schools and various public purposes.

The public domain of to-day is made up of over 180,000,000 acres in the United States, and more than 300,000,000 acres in Alaska. The greater part of the vacant lands in the United States is in the States west of the Mississippi River, though small areas subject to disposition are still to be found in the southern States of Florida, Alabama, Mississippi and Louisiana. The most important laws under which these lands may be acquired are: the homestead acts, requiring residence and cultivation; the desert land law, requiring irrigation; and the mining laws.

Public Land Service.—This vast empire is under the direct control of the Commissioner of the General Land Office, at Washington, subject to the supervisory authority of the Secretary of the Interior. The machinery for its protection and disposition is made up of the executive office in the Interior Department, about fifty district offices in the several public land States where entries are actually made; a cadastral engineering service, which surveyed about 6,000,000 acres during the fiscal year ended June 30, 1924. Also a field inspection force with varied duties having in view the prevention of fraud in the acquisition of title to the public lands, protection of the public timber against trespass and fire, and a general enforcement of the laws and regulations governing the acquirement of land titles from the government.

In the early days the public lands were disposed of at cash sale to raise funds for the running expenses of government. From May 20, 1785, to June 30, 1924, receipts from the sale of public lands and Indian lands aggregated more than $555,000,000. In addition to liberal land grants, millions of dollars have been paid the States for educational purposes and public improvements. The important operations of the U. S. Bureau of Reclamation in reclaiming arid lands by the concentration and distribution of water for irrigation are well known to the public; but how many people are aware of the fact that the funds for this work are provided by the General Land Office through its administration of the public land laws? Congress has been called upon to appropriate practically nothing from the general funds of the government since the enactment of the reclamation law in 1902, as that statute imposed the financial burden upon the land department and it has made possible the results attained. During the 22 years of operations under the reclamation act, the General Land Office has provided more than $128,000,000 for the work; during the 5 years since the passage of the mineral leasing act, over $20,000,000 have been added to the reclamation fund from the proceeds of oil and gas leases under that law. Incidentally the States in which these oil and gas lands are located have been enriched to the extent of about $15,000,000 during the same period.

Homestead Lands.—Of all the public land laws, the one of greatest interest, which brings the government into intimate relation with the claimant, is the homestead law. Under the other public land laws personal contact with the land is more or less incidental, but the seeker of a free home must actually reside upon the land for at least seven months each year for a period of three years and cultivate a prescribed portion. It is no undertaking for a weakling, as the lands still available for homesteading are not only mainly remote from railroads and towns, but are valuable for stock-raising purposes rather than cultivation of the ordinary agricultural crops. The Commissioner of the General Land Office is authorized to reduce the cultivation requirements upon proper grounds, and the homesteader is permitted to be absent from the claim for a period of five months each year in order to enable him to earn money for living expenses and improvements. Credit for military service against the term of residence required is given soldiers and sailors of the Civil War, the Spanish War, the Mexican Border Operations, and the World War; and veterans of the last war have a preference right of entry in connection with lands made available to entry by survey or restoration from reservation or withdrawal. A surprising interest in the opportunities afforded by the homestead laws was manifested by returning soldiers of the World War, and many of them have acquired farm homes in that manner. More than five and a half million acres were patented under the homestead laws during the last fiscal year.

The homestead law passed in 1862 is a heritage of the administration of President Lincoln. There were involved in pending entries under its provisions on June 30, 1925, approximately 30,000,000 acres and prior thereto it had contributed 1,378,884 farms for an area of 222,707,947.93 acres. More than a quarter billion acres consecrated to free homes. What a monument to the immortal Lincoln!

Grazing Land.—The conflict between settler and stock man is no longer the grave problem it once was, though isolated cases come to light. Free range on the public domain in large areas is a thing of the past, and what there is must be shared by the stock man with the settler. The former, generally speaking, has come to realize that loss of the free range does not mean destruction of stock-raising on a large scale, or even injury to the industry; certain allowable controls over grazing tracts by means of title or lease make it possible to improve the range by encouraging the growth of native grasses and cultivating forage crops, which means more and better cattle. Comparison of the number of cattle and sheep, and the quality as evidenced by prices received, raised in States with no free range, such as Ohio, Indiana and Illinois, with the same statistics relating to any of the far western States, will furnish convincing evidence that the cattle industry has nothing to fear from the encroachment of private ownership or a definite government control of the public grazing lands.

Legislation is now pending before Congress under which, if enacted, the Secretary of the Interior will be authorized to classify the grazing lands within the public domain and lease them under such regulations and in such bodies as will insure the preservation of the pasturage or forage values, with due protection to the settler and provision for the development of such mineral deposits as may be found.

Mineral Lands.—The government's policy of controlling natural resources within its public lands had its beginning with acts of Congress of 1909 and 1910, providing for the disposition of the surface of coal lands under the agricultural land laws and reserving to the government the coal deposits and the right to mine and remove the same. These acts were preceded by extensive withdrawals of lands known or believed to contain coal. Next came an act of 1914 reserving phosphates, nitrates, oil, gas and asphaltic minerals; and the plan of authorizing exploration for and leasing of reserved mineral deposits was inaugurated by the enactment of the potash law of 1917. The stock-raising homestead law of 1916 reserved all minerals in lands entered thereunder, and the leasing policy became firmly established with the general leasing law of February 25, 1920, having in view the development of lands containing, or believed to contain, deposits of coal, phosphate, sodium, oil, oil shale, or gas. The results effected by this legislation are best illustrated by the fact that under the first five years of its operation, the government has collected in rentals and royalties about $45,000,000, of which $10,000,000 went into the miscellaneous receipts of the government, and the balance was divided between the reclamation fund and the States in which the minerals were produced, as before stated.

Recreation.—In addition to its contribution to the permanent development of all that part of the United States south and west of the territory embraced by the thirteen original colonies by placing settlers thereon, the General Land Office has played its part in the preservation of the beauty spots and natural wonders of the public domain now available for the recreation and education of the people. Many of these have been reserved and developed as a result of information furnished by its field investigating force, and as the first administrator of the forest reserve act, it created an important nucleus for the present vast national forest system.

Outdoors.—In connection with its other activities along the lines herein briefly reviewed, the General Land Office is coöperating with the President's Committee on Outdoor Recreation in furtherance of the plan for developing Federal policies of land use in which recreation will have its proper place. The value of outdoor recreation is too obvious to require supporting comment, yet it has never been reflected in any active governmental participation, other than military preparedness. The President's plan will have not only the educational aspect of attracting the attention of the public to the benefits of outdoor life, aided by the fact of his interest in the matter; it will also result in adding materially to the opportunities for indulging therein. Recreational areas must be provided, and they must have such scenic, scientific, or other interesting attributes as will make them attractive. The plan will no doubt expand so as to bring about the establishment of such areas in all States whether or not they contain public lands. The first steps in its inception have naturally turned to the public domain. The General Land Office has made available the information secured by its surveyors and field inspectors and instructed them to make special effort to obtain and present in concise form data relating to areas suitable for recreational purposes.

Although the undertaking is in preliminary form as yet and legislation must be formulated for the proper control and administration of lands reserved and dedicated to this purpose, some important definite steps have been taken. A number of areas have been withdrawn from disposition under the public land laws and many others are under consideration, each possessing some special feature in harmony with the purpose in view. One tract contains a cave of more than local interest; another has on it prehistoric ruins; others are either on lakes or streams, affording fishing, bathing and boating, or suitable for camping facilities along public highways. The plan should enlist public interest and participation, since indulgence in reasonable recreation takes its place as one of the modern rules of health.

RECLAMATION AND IRRIGATION

By Hugh A. Brown

Bureau of Reclamation, Department of the Interior

DIFFICULTIES

Defects of Irrigation.—Since the close of the World War, conditions affecting irrigation have become quite different from what they were before that date. Irrigation engineering, as such, has been little changed, but the economic value of irrigation works is decidedly different. Engineering works theoretically perfect may be worse than useless because what they accomplish is not worth the cost involved. Such a condition may be remedied by better use of the works in some cases; in other cases, there is no way of meeting the high costs, and failure results.

The outstanding lesson of irrigation in the United States in 1925 is that while a large amount of sound engineering and construction has been done on public irrigation enterprises, it has often not been successful because, in the main, good engineering is no cure for inferior soil, poor farming and ill-advised politics. During the year the newspapers have carried many stories of the sad condition of farmers on some of the irrigation projects of the U. S. Reclamation Service, as told to investigating committees. The same newspapers have paid little attention to the statements of Elwood Mead, Commissioner of Reclamation, on the subject. He is one of the outstanding living specialists on the subject, with a record of successful achievements in this and other countries. In October, 1925, he gave an address before the Western Society of Engineers which is one of the most valuable explanations of the status of irrigation that has been made, for it tells frankly what is the trouble, what have been the causes of the trouble, what steps can be taken to remedy them under the present laws, and what legislation is necessary in order to salvage whatever of good there is in these irrigation projects.

Irrigation farming has all the difficulties of ordinary farming plus others peculiar to itself. An irrigation farmer cannot be so independent as a farmer in Connecticut or Iowa. He must coöperate with his neighbors in irrigating when his turn to take water comes. He must level his fields to take water. He must choose his crops not only with regard to soil, climate and markets, but also with a keen eye on their response to water. He must be a better than average farmer to win success. Many persons who should never have tried to become farmers on irrigated land have done so, particularly on federal projects; and their lack of success caused many protests from them in 1925. For it is usually the case that where money is owed to the United States protests against paying it are more numerous than is the case with debts to other creditors.

Repayment System.—The reclamation act of 1902 established a fund made up of the proceeds from sales of public land, to which a later act added half of the proceeds from mineral leases. This fund has been used to build the irrigation works and into it was to be paid a sum sufficient to recoup the cost of the works from repayments by the users of the water, made in annual installments during twenty years. No interest is charged on the deferred payments, but the operating expenses are assumed to be met promptly and entirely by the users. In short, the settlers really pay 5 per cent. interest on the cost of the works for twenty years, and the government then gives them the works. No other government is so generous to irrigationists. Yet to date, on only one project has even half the construction costs been paid; on some projects none of the construction costs has been paid and a large part of the operating costs is in arrears.

Good Results.—In spite of this unexpected weakness, there are some good things to report. One hundred and forty-three thousand persons are living on the irrigated farms of the Reclamation Service, and 337,000 in the towns on these projects. Some of these persons are doing well and many more are gradually working up to that condition. In Nevada, according to Dr. Mead, the State would be in a critical condition, with a population of only 70,000, without the Newlands-project farms which furnish winter feed for range stock. The irrigation farmers of Texas, Arizona and California are now the main source of long-staple cotton. These and other good things that might be mentioned are the result of good farming, however; and one of the defects of the government's policy on irrigation matters has been its lack of attention to the ability of settlers on its projects to develop into good farmers.

Reclamation Farmers. — Settlers cannot move on to irrigated farms and develop them as did the settlers in the prairie states, where a paying crop could be raised the first year. It often costs as much as $75 to $100 per acre to prepare an irrigated farm to-day for taking water. The cost of the irrigating works adds from $30 to $100 more; Dr. Mead estimates that it will be $158 an acre on the Columbia Basin project in Washington. Operating charges should be paid. Fences are needed to keep out range cattle, and a house for the farmer's family and a shelter for his work team must be built. Dr. Mead estimates that, at present prices, it costs from $5,000 to $7,000 to improve an 80-acre farm on the average irrigation project, before the first crop is raised; and that in some projects several years of careful irrigation are needed to bring the land to its best condition. Farmers who have the necessary amount of money will not go to these projects, as a rule; he believes the best settlers will prove to be those coming with $2,000 to $3,000, provided proper facilities for loaning them money at reasonable rates are made available and they are good farmers at the outset. No land should be taken up by untrained farmers or by speculators unwilling or unable to pay the charges of irrigation. The next session of Congress will have this matter before it.

Although the construction costs of the old projects have been burdensome, those of projects undertaken now will be much more difficult to carry. They cost now two to three times as much as in 1910, when a large part of the projects were built. There is a grave question if the water will be worth what it will cost to supply it on some projects under consideration, particularly in view of the increased price of everything the farmer must buy and the increase in taxation. Much of the land on these new projects is privately owned, sometimes in large tracts, and arrangements must be made for subdividing and selling it at fair prices to qualified settlers. There are other economic and administrative problems to be settled. It is clear that at the present time engineering is of less concern in the irrigation field than problems which relate to farming.

DAM CONSTRUCTION

Pending Projects. — Among the more interesting engineering works completed during the year were the Tieton dam on the Yakima project in Washington, an earth and rock-fill dam, 244 ft. high and 905 ft. long, with a concrete core wall; the Gerber dam, of the arch type, on the Klamath project in California and Oregon, 85 ft. high and 470 ft. long; and the Black Canyon dam, 183 ft. high and 1,040 ft. long, a concrete structure on the Boise project in Idaho. Among the works under construction are the American Falls dam on the Minidoka project in Idaho, having a concrete section 3,100 ft. long and 87 ft. high, and an earth section 1,900 ft. long and 75 ft. high; and the Guernsey dam on the North Platte project in Nebraska and Wyoming, which is an earth and rock-fill structure 97 ft. high and 575 ft. long.

Arch Dams.—The most interesting contemplated work is the construction and testing to eventual destruction of a concrete arch dam on Stevenson Creek in California. Concrete dams of the older types depend for their security on the weight of the masonry, the shape of the cross-section, and the completeness with which the dam and its foundations are bonded together. As the weight is the most important factor, these older dams are often called gravity structures.

About twenty-five years ago, in order to save some of the masonry needed in gravity sections, engineers began to construct thin dams convex upstream in plan so as to develop an arch action in them when water was impounded behind them. They are not true arches because they are held at the bottom by their foundations, but arch action is developed in an ever increasing degree measuring from the base up to the crest.

Test Arch Dam.—Several theories of the stresses in such structures in service have been proposed, and some checks on them have been obtained from measurements of the deflections of such dams as water rose behind them. It is now proposed to build an arch dam 60 ft. high and subject it to a great variety of tests, and then raise it by a succession of 10-ft. steps, repeating the tests at each successive addition to its height. The dam will eventually be raised to a sufficient height to cause failure, if possible. These tests are the most elaborate full-scale engineering investigation ever undertaken.

FEDERAL RECLAMATION AND IRRIGATION

The Bureau of Reclamation.—The Bureau of Reclamation (originally the Reclamation Service) was organized in the Department of the Interior under the Act of June 17, 1902, which provided that receipts from the sale of public lands in the states of Arizona, California, Colorado, Idaho, Kansas, Montana, Nebraska, Nevada, New Mexico, North Dakota, Oklahoma, Oregon, South Dakota, Utah, Washington, and Wyoming should be set aside in a special fund known as the reclamation fund, to be used in the examination and survey for and the construction and maintenance of irrigation works for the storage, diversion, and development of waters for the reclamation of arid and semiarid lands in the States named. Later the provisions of the act were extended to the State of Texas.

Funds Available.—In addition to the funds made available by the above act, other large sums have been added in recent years under the oil leasing act of February 25, 1920, which provides that for past production 70 per cent. and for future production 52½ per cent. of the amounts derived from bonuses, royalties, and rentals should be paid into the reclamation fund. Other large additions to the fund come from the collection of construction charges, operation and maintenance charges, water rentals, and power sales; and smaller accretions from town lot sales, potassium act receipts, and receipts under the Federal water-power act. Funds made available for expenditure to June 30, 1925, are summarized as follows:

Accretions to the reclamation fund:		
Public land sales	$107,165,289.14	
Oil leasing receipts	23,710,420.57	
Town lot sales	586,630.16	
Potassium act receipts	25,186.07	
Receipts under Federal water power act	10,756.05	$131,498,283.99
Special appropriations and bond loan		20,127,190.60
Collections for construction, operation and maintenance, and incidental operations		59,390,700.59
Total		$211,016,175.18

Irrigation Projects.—Twenty-seven projects have been constructed or partially constructed by the Bureau, located in sixteen of the seventeen arid States of the West. No project has yet been constructed in Oklahoma. The Garden City project in Kansas, the Hondo project in New Mexico, and the Buford-Trenton division of the Williston project in North Dakota have been abandoned; and steps are now being taken to sell the remaining division of the Williston project. The table which appears on page 262 lists the present projects, by States, and includes statistics of cost, the acreage for which water was available in 1924, irrigated acreage, cropped acreage, value of crops grown in 1924, and value of crops per acre.

In addition to the area supplied with water in 1924 on the project proper, the bureau also furnished a whole or partial water supply under the Warren Act to more than 1,000,000 acres of land contiguous to the projects.

Construction Results.—During the twenty-three years of its operations, the Bureau of Reclamation has constructed more than 100 storage and diversion dams. The volume of masonry, earth, rock-fill and crib in these dams amounts to 18,342,000 cubic yards. Many of the structures are world famous, such as the Roosevelt dam on the Salt River project in Arizona, a rubble masonry arch, 280 feet high, forming a reservoir with a capacity of 1,635,000 acre-feet; the Elephant Butte dam on the Rio Grande in New Mexico, constructed of rubble concrete, 306 feet high, the capacity of whose reservoir is 2,638,000 acre-feet; and the highest of all, the Arrowrock dam in Idaho, on the Boise River, a rubble concrete arch rising to the height of 349 feet. The total reservoir capacity on June 30, 1925, amounted to 10,325,000 acre-feet of water, or sufficient to cover the State of Massachusetts to a depth of two feet.

The bureau has constructed nearly 16,000 miles of canals, ditches and drains, more than 140,000 canal structures, 10,700 bridges, 12,000 culverts, 106 tunnels aggregating nearly 30 miles in length, and has laid 3,688,816 linear feet of concrete, metal, terra cotta, and wood pipe. More than 1,000 miles of roads, 83 miles of railroad, 3,350 miles of telephone line, and 1,652 miles of transmission line are listed under the head of "communications" constructed by the Bureau. The total amount of earth, indurated material and rock excavated by the bureau to June 30, 1925, reached the enormous total of 245,814,581 cubic yards.

Agricultural Results.—From the time that water was first available for crop production crops to the value of approximately $650,000,000 have been grown on the area included in the projects proper, and an additional large area under private ownership has been served with water from the project works, producing crops valued annually at many millions of dollars. In 1924 the bureau furnished water for the irrigation of 1,805,730 acres on the projects proper, of which 1,290,890 acres were irrigated and 1,216,610 acres cropped, producing crops worth $66,488,560. In addition to this the land under private projects, which was served water under the Warren Act, produced crops valued in that year at $43,237,470.

Character of Crops.—Owing to the extreme variations in climate on the irrigation projects, ranging from the short growing season of the northern tier of States, to the all-year round season of the Southwest, the crops grown on the projects show a corresponding range from those primarily adapted to the temperate zone to those found in a tropical or subtropical climate. On the projects in the State of Washington, apple orchards predominate. In the Southwest, cotton is raised extensively. Between the two extremes a number of the projects grow a large tonnage of sugar beets, a crop which holds a promise of ultimate success to a number of projects struggling with agricultural difficulties.

Crops.—Taking the projects as a whole, alfalfa is the predominating crop, representing in 1924 nearly 38 per cent. of the cropped acreage and 23 per cent. of the value of all crops. Cotton accounted for about 18 per cent. of the total acreage and 34 per cent. of the total value. Cotton and cotton seed together were valued at $22,500,000 in 1924. Only 2 per cent. of the cropped acreage was represented by apple orchards, yet the value of this crop was more than 6 per cent. of the total crop value, amounting to $4,152,000. The accompanying table gives a distribution by large groups of the crops grown on the projects in 1924:

CROP ACREAGE AND VALUE, 1924

Crop	Acreage Cropped	Value	
		Total	Per Acre
Cereals	225,374	$ 5,000,493	$ 22.20
Other grain and seed	26,271	1,018,369	39.00
Hay and forage	690,592	18,101,083	26.21
Vegetables and truck	70,787	8,137,949	115.00
Fruit and nuts	42,445	7,153,205	170.00
Sugar beets	67,123	4,140,818	61.70
Cotton and cotton seed	216,450	22,516,189	84.43
Other miscellaneous	18,260	420,444	23.02
Duplicated land acreage	140,702		
Land acreage cropped	1,216,610	66,488,560	54.65

Economic Conditions on the Projects.—Largely as a result of the deflation measures following the World War, and the resulting conditions brought about by high prices of land, seed, materials and supplies used on the farm, many settlers on the projects found it progressively more difficult to meet their obligations to the government and began to fall behind in their payments. More and more farmers, during the period of the war, when returns for agricultural products were abnormally large, had incurred burdensome indebtedness for the purchase of additional land at inflated prices or for the construction of new buildings. Municipal, county, and State assessments added to the weight of the load per acre which the over-taxed land was called upon to pay. Because of the fact that the Government charge bore no interest, it was the last to be paid. As a result the total of uncollected charges continued to swell.

Another cause of inability of the water users to meet their payments was the fact that on many of the projects land had been included originally which later proved infeasible to cultivate, although bearing the same charges as those assessed against the most fertile land on the project.

Committee of Special Advisers on Reclamation.—In order to determine the agricultural and economic conditions on the projects, with a view to recommending remedial legislation, the Secretary of the Interior appointed a Committee of Special Advisers on Reclamation, comprising Thomas E. Campbell, chairman, former Governor of Arizona; Dr. John A. Widtsoe, secretary, former President of the Utah Agricultural College; James R. Garfield, former Secretary of the Interior; Oscar E. Bradfute, President of the American Farm Bureau Federation; Clyde C. Dawson, a specialist on irrigation law; and Dr. Elwood Mead, widely known reclamation economist and professor of Rural Institutions of the University of California, now Commissioner of the Bureau of Reclamation.

This Committee made an exhaustive investigation of and report on the projects. A number of its recommendations were incorporated in the Act of December 5, 1924. This Act provides for the determination of the feasibility of a project and its adaptability for actual settlement and farm homes before construction is authorized; selection of settlers on the basis of industry, experience, character, and capital; classification of the irrigable lands with respect to their power to support a family and pay water charges; the payment of construction charges on the basis of the productive power of the land, in annual payments of 5 per cent. of the average gross annual return; the taking over of the operation of the projects through a legally organized water users' association or irrigation district; a comprehensive survey to ascertain all pertinent facts where it appears that, on account of lack of fertility of the soil, an inadequate water supply, or any other physical causes, settlers are unable to pay construction costs, or whenever it appears that the cost of any reclamation project has been apportioned or charged upon a smaller area of land than the total area of land under the project. It authorizes an appropriation of $100,000 for investigations to determine how arid and semi-arid, swamp and cut-over timber lands may best be developed. Steps are being taken to put this legislation into effect at the earliest possible date.

Board of Survey and Adjustments.—Under the provision of the above act for a comprehensive survey of the projects, supplemented by an appropriation for the purpose, the Secretary of the Interior appointed a Board of Survey and Adjustments to classify the lands on the projects and to adjust the differences between the water users and the Bureau. Thomas E. Campbell and Dr. John A. Widtsoe were appointed adjustment advisers, and each designated chairman of the board to function as two boards, one for the northern and one for the southern projects. Other members of the board comprised a representative of the State interested, designated by the Governor, and a representative of the Bureau of Reclamation. These boards were assisted by soil experts, representatives of State Agricultural Colleges, and by local coöperative committees on each project. The duties of the board were—

1. In general, to determine conditions on the projects with a view to applying the remedial measures provided in the Act of December 5, 1924, outlined above.
2. In particular, to make the surveys and reports required by the Act.
3. To make recommendations for contracts and agreements that may secure regular payments for construction and for operation and maintenance charges.
4. To help promote good feeling among the water users.

The final reports of the board, coordinating the various recommendations, will be submitted to Congress for suitable action.

Assessed and Uncollected Charges.—During the past five years, 1920-1924, there has been a progressive falling off in payments due the Government from irrigators on about one third of the Federal reclamation projects. Delinquencies from all projects for this period amount to a total of $8,685,000. For the last year of the period it has increased more than $3,000,000. Some projects have

* Including operation and maintenance during construction.

† Acreage for which water was available

‡ Under construction

paid all their assessments; others have paid practically nothing.

These delinquencies fall into two groups. The first includes those where irrigators are unable to pay from causes beyond their control, such as poor soil or inadequate water supply. The second is due to conditions which can be controlled. On some projects large areas of fertile land are either unfarmed at all or very poorly farmed, and on prosperous projects there are irrigators amply able to pay but lacking the will.

Relief Acts.—A number of acts have been passed by Congress providing for temporary relief to the settlers by deferring payments on the charges assessed. The most important of these is the Phipps Act of May 9, 1924, which carried over to 1926, 1927, and 1928 the debts of those who were delinquent. Deferred payments under this act amount to $4,837,000.

Measures to Improve the Financial Situation.—The result of these acts, providing blanket moratoriums for those applying for relief, but not providing for a refund to equally deserving settlers who had paid their charges, was a lowered morale and an increase in the number seeking deferments. In order to check this drift into insolvency, insistence is being made upon the payment of current operation and maintenance charges in advance. Water users have also been advised that hereafter no blanket deferments will be granted to those in arrears, but that relief, where granted, would be to individuals, and only on a showing by the individual that he is unable to meet the payments because of conditions beyond his control.

Closely linked with this problem is that of the selection of settlers on the basis of adequate capital and experience, and their financial aid and direction during the time the raw land is being changed into a producing farm. It is immaterial whether this financial aid is furnished by the Federal Government, the State in which the project is located, or by private finance corporations, provided that it is readily available at a low interest rate to deserving settlers and is amortized over a suitable period of years. Much thought has been given to this problem, and bills have been introduced in Congress to provide such aid.

Bureau of Indian Affairs.—The bureau has constructed works for the irrigation of about 1,369,000 acres of land on Indian reservations, of which approximately 355,000 acres were irrigated in 1924 on 84 projects.

FEDERAL GEOLOGICAL SURVEYS

By George Otis Smith

Director, U. S. Geological Survey

Services to the Public.—Forty-six years have passed since the United States Geological Survey was created by Congress, and besides meeting the demands of those years, this field organization with headquarters in Washington has gradually become a great storehouse of information on the mineral resources of the United States. Through its systematic study of the mineral wealth, the water resources, and—of late years especially—the lands of the public domain, the Geological Survey is able to-day to supply on immediate call authoritative information to the general public as well as to other Federal bureaus. Its aim has been to furnish the basic facts, and the careful topographic, geologic and hydrographic surveys by this scientific service have contributed in no small degree to the success of our national parks, national forests, and great highway systems, as well as the Government irrigation works and drainage projects, the Government coal and oil and water-power reserves, and the general advance of the mining industry.

Demand for Geologists.—The work of the Geological Survey is necessarily foundation work, and in after years, when the various superstructures have been reared upon it, the earlier preparatory work is generally lost to view; consequently a great many people have never even heard of the United States Geological Survey. Nevertheless the geologist may now be said to be coming into his own. With the exhaustion of many of the more easily developed mineral deposits, coupled with the constantly increasing commercial demand for them, the task of finding reserves to keep our industries going becomes harder and harder year by year. The commercial world realizes this but dimly if at all; but the technical staffs of the mineral industry well know it as a fact. In line with this need there has come about the "discovery" of the geologist during recent years by many branches of the mineral industry; and the result has been to accentuate the economic applications of geology and greatly to increase the number of geologists professionally engaged in directly applying their science to oil discoveries and to mining. Besides the acceptance of the value of the economic geologist there is a growing recognition of the value of fundamental research work, that may throw light on the laws that control the occurrence of useful minerals. The scientific staff of the Geological Survey, within the limitations of men and means provided, tries to meet the economic needs of the country and at the same time conduct as much research as possible for the general advancement of science. However, it is always to be remembered that research into the realms of "pure science" of to-day may bring forth results that to-morrow may be definitely applied to economic development. So, in this sense all the work of the Geological Survey is economic.

Branches of Service.—For purposes of administration the Geological Survey is divided into five scientific branches—the Topographic branch, which is making a topographic survey of the entire country; the Geologic branch, which is studying and mapping the mineral deposits of the country; the Water Resources branch, which is determining the water resources of the country, above and below ground; the Conservation branch, which is classifying, valuing and aiding in administering the great public domain; and the Alaskan branch, which is carrying on practically all of these activities in Alaska.

Geological Survey Maps.—A topographic map is a relief map that not only shows with remarkable accuracy the shape and altitude of land and water features by means of contour lines, but also the works of man such as railroads, highways, buildings, etc., in their direct relation to one another and to the natural features of an area. They are basic maps, and are in fact used as bases for engineering projects of every kind, from the smallest to the largest. The Geological Survey has thus far mapped about 40 per cent. of the area of the United States, and the results are published in nearly 3,400 different topographic maps. Last year more than 18,000 square miles were thus topographically mapped. An interesting phase of this work is the growing use of the airplane in even this very accurate kind of map-making. In Texas alone 3,721 square miles were topographically mapped and every mile of it with the aid of aerial photography, thus increasing the output by fully 25 per cent. In topographic mapping throughout the country twenty-nine states, counties, municipalities, and Hawaii coöperated with the Federal Survey, contributing toward the work over $400,000.

Field Work.—In geologic work the Survey's activities are also countrywide and the kinds of deposits examined and studied by field geologists, both in the Eastern States and on the public lands of the West, would constitute a long list of useful minerals. As already intimated fields of inquiry that used to be regarded as purely scientific are now recognized as intensely practical. The Survey staff of paleontologists is constantly occupied in identifying fossil collections not only to determine the succession of rock layers but to aid the commercial geologists of the mineral industry, especially the oil industry, in finding out what rocks they are dealing with in their development work. Fossils were once defined by the late Director John W. Powell as the "time-clock" of the geologist, by which he could tell the age of the rocks; they may also be described as the geologist's compass.

Water.—Water is our most abundant and most essential mineral and the Geological Survey is the authorized agency for collecting and publishing data relating to water, whether they pertain to water-power, water for irrigation, or water for industrial and municipal use. The Geological Survey last year coöperated with thirty States and Hawaii as well as many other government agencies that deal with water resources, and to carry on its stream measurements it occupied 1,715 river gauging stations throughout the country.

Classification of Public Lands.—In its work of classifying the public lands the Geological Survey, drawing on its vast fund of accumulated information, has in comparatively recent years classified over 31,000,000 acres of coal land, 71,000 acres of oil land, over 4,000,000 acres of oil shale land and nearly 300,000 acres of phosphate land. The engineers of the Survey now have technical supervision of the oil and gas, coal, phosphate and other leases on the public domain. This work has also resulted in the reservation of more than 5,000,000 acres as water-power reserves whose use will be required for the development of about 15,000,000 continuous horse-power; also in the designation of public lands available for entry under the enlarged homestead law of nearly 325,000,000 acres, and under the stock-raising homestead law of another 116,000,000 acres.

Work in Alaska.—Perhaps nowhere has the Geological Survey made a more clear-cut record than in Alaska. Year after year the great Territory has yielded up its mysteries to Survey explorers who have tramped and canoed and dog-sledded across its vast stretches, and climbed and explored its high mountain areas. The result has been that the mineral resources throughout the Territory are to-day fairly well known and the Geological Survey's maps and reports have been put into the hands of thousands of prospectors and miners. During last year Geological Survey men continued the exploration of Naval Petroleum Reserve No. 4, the topographic engineers and geologists filling in the largest blank space on the map and at the same time determining the degree of probability that here in far northern, arctic Alaska, may be found petroleum which will be available to meet naval and other needs.

Engraving and Printing.—Even a brief account of the work of the United States Geological Survey should have a reference to its own large engraving and printing plant where, last year, nearly three-fourths of a million of its own maps were engraved and printed, besides several million maps, charts and publications printed for other governmental establishments.

STATE GEOLOGICAL SURVEYS

By M. M. Leighton
Chief of Illinois Geological Survey

Recognizing their mineral wealth and the aid which modern geology is able to render in an intelligent exploration, recovery and conservation of this wealth, most states maintain geological surveys. During 1925, somewhat more than one million dollars was appropriated for their service, and this was further increased by perhaps $300,000 or more by coöperating federal agencies, counties, and local organizations and industries. Some surveys, however, were embarrassed either by diminished appropriations or temporary denials. All who possessed funds have apparently given a good accounting and in most respects are serving the needs of the present complex civilization for geological information and authoritative base maps. About 100 full-time technically trained men, and 160 part-time technically trained, participated in this scientific effort; aided by a clerical staff of some 90 people. The following results were obtained:

FUNDAMENTAL STUDIES

Although most large mineral industries now employ their own geologists or mining engineers for local detailed work, they need basic information on stratigraphy, paleontology, structural geology, physiography and historical geology.

Arizona has prepared an elaborate and beautifully illustrated book summarizing the geology of Arizona, also a report on the geology and mineral resources of the Payson district, and has nearly completed reports on the Courtland-Gleeson Mining District and the Jerome quadrangle, the latter in coöperation with the United Verde Copper Company.—California has completed a report on the geology and deposits of the Randsburg quadrangle.—Georgia carried on work in structural geology and the physiography of the state.

Idaho made a study of the Rocky Bar quadrangle, in Elinore County, and a stratigraphic reconnaissance of Clarke, Butte, Custer and Lemhi counties. Illinois continued its systematic study of the Silurian, Pennsylvanian and Pleistocene formations, its microscopic study of the Chester series, and detailed studies and mapping of the Alexis, Monmouth, Beardstown, Liberty, and Harrisburg quadrangles. Iowa continued its work on the Silurian, Pennsylvanian, and Pleistocene. Kentucky completed the areal mapping of the major divisions of the Mississippian, and Devonian, for the new State geological map. In addition the structural geology of Greenup, Carter, Lawrence, Morgan and Knox Counties was completed, a geological map was prepared for Morgan County, the stratigraphy and structure of the Western Coal Basin and of the Eastern Kentucky Coal Field were completed, and also a detailed report and map of Edmonson County. In Maryland most of the areal work is now in the nature of revision. The present year's work has resulted in unraveling much of the complex structure and stratigraphy of the Piedmont area. — Mississippi has prepared a bulletin on the stratigraphy and mineral resources of the State.—Ohio devoted the year to the faunal studies of the Monroe limestone and began a study of the Monongahela formation.—Oklahoma investigated the areal geology and economic resources of three counties, and prepared a subsurface map of northeastern Oklahoma.—Pennsylvania completed the areal geology of one quadrangle and made substantial progress on several others.—South Dakota carried on some special stratigraphic studies and undertook a detailed study of some local structures and a general study of the larger structural features of the state.—In Tennessee the geology of the Nashville Basin was completed and the Tertiary formations of West Tennessee were studied. Some stratigraphical, paleontological and petrographical work was done in Vermont.—Virginia began work on the Lower Cambrian.—West Virginia completed Pendleton, Mercer, Monroe and Summers Counties.—Wisconsin had the coöperation of the U. S. Geological Survey in some stratigraphic studies of the Lower Paleozoic formations.—Wyoming projected a reconnaissance in the Atlantic South Pass Gold Mining District and the geological mapping of Medicine Bow Range.

STUDIES BY MINERALS

Oil and Gas.—Illinois is undertaking a study of the chemical composition of the oil field waters of the State, and has completed the field work on the oil and gas possibilities of the Sparta and Ava areas.—Kentucky has prepared new oil and gas maps for Fulton, Trigg, Grayson, Hart, Barren, Clinton, Wayne, Taylor, Oldham, Mason, and Fleming, and for the northern part of Menifee and northeastern part of Ohio counties.—New Mexico appropriated about $7,000 for the supervision of the oil industry of the State, and appointed an oil geologist to function under the State Commissioner of Public Lands. The University will publish a report on oil conditions in the State.—Ohio continued a study of the oil and gas conditions in Clinton County.—Oklahoma carried on investigations in oil and gas.—Tennessee made a study of the Bone Camp and Glenmary oil fields in Scott and Morgan counties.—Wyoming pursued field work on the oil and gas possibilities of Platte, Laramie, and Goshen counties, and made an inspection of most of the structures and oil and gas fields in the State.

Coal.—Illinois completed a report on the Coal Stripping Possibilities of Illinois, and of the Coal Resources of District III (western Illinois).—Kentucky completed the field work for a report on the geology and coals of the Middlesboro syncline between Pineville and Cumberland Mountain in southeastern Kentucky, and continued its study of the western Kentucky coal field.—Ohio made a limited collection of samples of coal and analyses.—Pennsylvania carried on special studies in the conservation of coal, particularly the small sizes of anthracite.

Ore Deposits.—Iron ore was studied in Georgia, North Carolina, and Wisconsin, Wisconsin carrying on detailed and magnetic surveys in twelve townships of Douglas County. Lead and zinc received attention in Oklahoma. The gold deposits in Tennessee were studied.—Arizona completed the investigations of its mercury resources, in coöperation with the U. S. Bureau of Mines.—Idaho made a survey of the mineral resources of Boundary County.—Kentucky undertook a statewide study of its vein ores.—Pennsylvania is writing reports on its metallic deposits.—Wyoming made an inspection of various mines and prospects and other occurrences of metallic and nonmetallic minerals.

Structural Materials.—Cement materials were studied in Arizona and Kentucky. Clays were investigated in Pennsylvania and South Carolina. Building stone was studied in Arizona, Oklahoma, southeastern Pennsylvania, and South Carolina. A survey of road making materials, either hard rock or sand and gravel, or both, was made in Idaho, South Dakota, and Wisconsin.

Water Resources.—Kentucky continued its coöperation with the U. S. Geological Survey in a study of its water resources and stream flow.—New Jersey carried on quantitative studies of underground waters and continued gauging of streams.—North Carolina maintained fifty-six stream gauging stations, made one hundred twenty measurements of low water flow, carried on coöperative investigations on Flat River, supervised the making of the dam for Lake Waccamaw, studied the stream flow polution of Moccasin Creek, made evaporation studies in Chapel Hill and a complete survey of New River, and revised its publication on the power situation in North Carolina.—Pennsylvania made a reconnaissance study of its water resources.—South Dakota attempted to arouse the well owners of the State to the necessity for the conservation of artesian water.—Tennessee carried on coöperative work in stream gauging, increasing the number of gauging stations from 43 to 54.—The Virginia legislature has provided for a Commission on Water Power and Development, which is authorized to make a thorough study of the water power, industrial, and agricultural resources of the State. A map of Virginia has been issued, showing the power stations, transmission lines, and installed or proposed gauging stations.

Soils.—Studies of soils were carried on by the Geological Surveys of Mississippi, New Jersey, Tennessee, West Virginia, and Wisconsin.

Miscellaneous Investigations.—California completed its report on magnesite, Idaho studied its thermal and mineral springs, Kentucky its molding sands, North Carolina its deposits of pyrophyllite, Tennessee its phosphate deposits, Wisconsin its molding sands, and valuations of mines for the Tax Commission.

TOPOGRAPHIC MAPPING

Twenty states coöperated with the U. S. Geological Survey in topographic mapping, and completed for the fiscal year ended, June 30, 1925, a total of 14,207 square miles of sketching, 6,766 miles of primary levels, 4,354 miles of primary traverse, 1,705 permanent bench marks, 1,096 permanent primary traverse marks, and 109 triangulation stations were completed and 85 marked. Of the total area mapped, only 529 square miles were revised or re-surveyed. In West Virginia, the culture of fifteen quadrangles was revised.

Changes in Personnel.—To succeed the late Doctor Thomas L. Watson, Mr. Wilbur A. Nelson was elected State Geologist of Virginia, and Mr. Hugh D. Miser was appointed State Geologist of Tennessee to succeed Mr. Nelson.

PUBLIC BUILDINGS

By James A. Wetmore
Acting Supervising Architect, Treasury Department

General.—The functions of the office comprise construction of federal buildings throughout the country and maintenance and operation of nearly all of such buildings after completion. The output of the office includes Post Offices, Courthouses, Customhouses, Appraisers' Stores, Mints, Assay Offices, Barge Offices, Sanitariums, Marine Hospitals and Quarantine Stations, and with comparatively few exceptions the furnishing, equipping, repair, maintenance and operation of such buildings devolve upon the office of the Supervising Architect.

There are now approximately 1,300 such buildings and the maintenance and operation of these, exclusive of the repairs, consumed during 1925 slightly over $8,700,000. Expenditure for this purpose increases annually in proportion to the new buildings placed in operation; the normal increase is 100 buildings per year but during 1925, as well as some previous years, the increase has been less than one-third of the normal increase for the following reasons:

Building Projects.—At the time the United States entered into the World War practically all new construction work was suspended and at the close of the war the cost of materials and labor had advanced to such a figure that it was found impossible to award contracts within the funds available, except in a few isolated cases.

It should be noted that Congress fixes for each building a limit of cost and no project is started that cannot be completed within that limit. The principal contract for the building usually includes approach work consisting of sidewalks, curbing, driveway and trucking space for post office trucks. For minor items, such as exterior lamp standards, interior lighting fixtures, lock box equipment, vault shelving, painting of plastered walls and ceilings, and similar work, reservations are made at the time of awarding the principal contract and these items are contracted for later.

At the close of the war there were left some 130 projects on the books of the office and for several years attempts were made to secure increases in limits of cost for the various projects but without success.

Relief Methods.—In the meantime working space, especially in the Post Office Buildings in the larger cities, had become exceedingly congested and in order to relieve this condition to some extent, a general appropriation of $220,000 was obtained in 1920 for the purpose of providing additional space by such means as small extensions, construction of mezzanines, and rearrangement of basements to make existing space suitable for postal operations. The cost of any one project was limited to $20,000 but the expenditure seldom approached that figure; the average was between $6,000 and $7,000. This method of relieving congestion proved so successful, additional space being provided at from $5.00 to $6.00 per sq. ft., that the appropriations for the following years were gradually increased, reaching in the present year $800,000, expended mostly for extensions ranging in size from 400 to 2,500 sq. ft., at an average cost of $10,000.

Resumption of Construction.—With the view of resuming construction work on some of the 130 authorized buildings in smaller communities extensive studies were made for the purpose of producing designs that could be carried out within the limit of cost. With the coöperation of the Post Office Department and other Departments concerned, some reductions in requirements were made so that this office felt justified in making an attempt to get construction work started again. The result was that between twenty and thirty buildings were contracted for per year; and 1925 is about on a par with previous years. A subsequent tabulation includes the approximate obligation for buildings contracted for during 1925 as well as expenditures for buildings completed during 1925, and for buildings under construction for which the contracts were let during the previous year. The bulk of the buildings are Post Office buildings, costing generally less than $100,000 each. While these buildings are very plain, usually faced with brick, they are well proportioned and have sufficient architectural distinction to stamp them as Federal Buildings. They have generally proved satisfactory to the communities in which they have been erected.

Hospital Buildings.—In addition to the output of buildings of this character much effort has been devoted during the last few years to hospital construction for war veterans, for which some $24,000,000 has been expended, and during 1925 out of the small balances remaining from the various hospitals, a recreation building has been constructed at the Veterans' Hospital, Castle Point, N. Y., at a cost of $80,000, and drawings have been prepared for a similar building at the hospital at Tuskegee, Ala., for colored veterans. Working drawings and specifications have also been prepared for a hospital building at Sawtelle, California, involving approximately $1,300,000; for the Federal Industrial Institution for Women at Alderson, W. Va., comprising some twenty-two buildings and involving approximately $2,000,000; and for a Quarantine Station at Mobile, Ala., involving $300,000.

The appropriation for the hospital at Sawtelle was made to the Board of Governors for the National Home for Disabled Volunteer Soldiers, headquarters Dayton, Ohio, and the appropriation for the Industrial Institution for Women at Alderson, W. Va., was made to the Department of Justice, but taking advantage of the organization and experience of the Office of the Supervising Architect the architectural and engineering work was entrusted to that office.

Transactions.—The office work for 1925 included also the usual reports and estimates to Congress on proposed building legislation, involving correspondence with other Departments regarding requirements and in quite a number of cases field surveys to ascertain the best method of meeting the requirements either by extensions to present buildings or by new buildings, and cost of sites. Several hundred such reports are made annually.

Contracts let for construction of buildings during calendar year 1925: 23 buildings aggregating	$ 1,220,000
Buildings completed during calendar year 1925: 27 buildings and 2 extensions aggregating	2,050,000
Buildings awarded prior to 1925 and still in course of construction: 8 buildings aggregating	550,000
Appropriation for "Remodeling and Enlarging Public Buildings"	600,000
Treasury Department Act, approved Jan. 22, 1925, 22 items	539,000
Annual appropriation for "Repairs to Public Buildings"...	1,480,000
Annual appropriation for "Repairs to Mechanical Equipment"	503,700
Annual appropriation for "Furniture and repairs to same"..	745,000
Annual appropriation for "Safes, Vaults and Lock Boxes"......	195,000
Designs, working drawings and specifications for a number of large special projects, aggregating	4,300,000
Annual appropriations for "Operating Force" and "Supplies"..	8,719,606
Appropriations, obligations and disbursements	$20,902,306

WATERWAYS AND HARBORS

By Harry Taylor

Major-General, U. S. A., Chief of Engineers, War Department

Note.—With the exception of a few privately owned and state owned canals, the harbors and inland waterways of the United States are improved for navigation through the agency of the Corps of Engineers, U. S. Army. For a brief statement of the organization and magnitude of its work, see *Defense and Armament—The Army.*

INLAND WATERWAYS

Location and Description.—The principal systems are the Great Lakes, together with the New York State Barge Canal and the Hudson River; the Mississippi system, including the Missouri, the Ohio and the important tributaries of the latter; the rivers of the Atlantic Coast and the intracoastal waterways connecting them; the rivers of the Gulf Coast, and the intracoastal waterway system running from Mobile via New Orleans down the Texas coast, and connecting with the numerous southern Louisiana waterways and with the Mississippi system; the San Joaquin-Sacramento system in California; the Columbia system in the northwest; and the minor Pacific coast rivers. These are improved over stretches and to depths commensurate with their commercial importance and with the benefits which are derived from them. The Great Lakes, which are really inland seas, have connecting channels from Superior to Erie at least 21 feet deep at standard low water, and corresponding depths are provided at the most important harbors. The Hudson and the New York State Barge Canal, and the intracoast system from Trenton, N. J., to Beaufort, N. C., have 12 feet. The Mississippi has 9 feet to Cairo, and project depths of 8 feet to St. Louis and 6 feet to St. Paul; the Ohio a 9-foot project, with 6 to 9 feet on its main tributaries; the Missouri a 6-foot project to Kansas City; the San Joaquin has a 9-foot and the Sacramento a 7-foot channel. Various other rivers and waterways range from 7 feet or more to 3 or 4 feet, and those of small importance often have no specified project depth, and are improved simply by the removal of snags and obstructions.

The above figures give the *project* depths toward which the War Department is working. They have not yet been attained in all cases, due to limitation in time and funds. Among the important sections not yet to project depth are the Mississippi from Cairo to St. Louis, and from St. Louis to St. Paul; the lower Missouri; and the lower Ohio. Work on these is being pushed as rapidly as possible.

Commercial and Economic Importance.—For full details see *Inland Waterway and Coastwise Commerce.* The corrected total of inland waterway commerce for 1924 was 173,200,000 tons valued at $3,446,035,000. Rough estimates indicate that the direct benefits to the public, in the single item of reduced transportation charges on freight actually moving by water, and disregarding all ulterior benefits, are sufficient to pay about every two years for the entire sum spent since the beginning of our history in providing the improvements.

Status of Water Transportation.—Inland waterway transportation, after a widespread decline which began about the end of the civil war, has in the past ten or fifteen years shown a pronounced increase. The two most important factors are probably, first, the realization that, under suitable conditions as to character of material, location or origin and destination with respect to waterways, suitable channels, and modern carriers and terminals, water transportation is inherently cheaper than any other form, and that to ignore this means a gigantic economic waste. Second, the growing realization that the three chief means of internal traffic, viz.: railways, waterways and highways, are properly not competitive but coöperative, and that the full development of any one of them is not only of great benefit to the public at large, but also benefits instead of injuring the other two. This is self-evident from the fact that, where waterway transportation is most intensively developed, as on the Great Lakes, the Hudson, the upper Ohio and California systems, rail transportation is also highly developed and in a flourishing condition.

The full measure of waterway recovery is not apparent from current statistics of total tonnage, since even in the worst days of the waterways scores of millions of tons moved on them. The tendency in the past was, however, toward movements almost wholly of low grade bulk material, on short hauls, between all-water points, with the exceptions in a few special cases, such as the Great Lakes. The notable tendency at present is toward the movement of higher grade traffic, over long stretches, involving in many cases rail hauls at one or both ends, and thus requiring cooperation of the railroads in the establishment of equitable joint rates. There is also a distinct tendency toward providing modern and efficient carriers, terminals and transshipment facilities.

Mississippi.—In no section of the country is this more evident than in the Mississippi Valley. The Mississippi up to St. Louis is now served by the Inland Waterways Corporation, which is touched on below. During the year there has developed strong agitation for the establishment of adequate carriers on the upper Mississippi. On the Ohio system there has long been intensive traffic on the upper section, such as the coal movements on the Monongahela, Allegheny and Kanawha and the Ohio itself. With the approaching completion of the river improvement, whereby it will be tied to the main Mississippi with a year-round 9-foot channel, the great steel companies of the upper valley are spending large sums for new floating plant, and have already begun to ship their products down the river. There is also activity in the direction of establishing additional efficient common carrier service. Such instances could be multiplied on numerous important waterways throughout the country.

The attitude of farseeing public men on the importance of our national waterways system, the need of completing it and of intensively developing its traffic, and the proper cooperative relation between railways and waterways, is well illustrated by the speeches of Secretary of Commerce Hoover, at Kansas City, on October 19, 1925, and of Secretary of War Davis, at St. Louis, on November 23, 1925, which have been extensively quoted throughout the country.

Inland Waterways Corporation.—This was created June 3, 1924, by an act of Congress. It represents a reorganization of the Federal Barge Line created during the war, and in its present form is a corporation functioning like any other, but controlled by the Government through the Secretary of War. The present chairman and executive officer is Brigadier General T. Q. Ashburn. It operates a fleet of modern barges and towboats on the Mississippi River from New Orleans to St. Louis, on the Warrior in Alabama, and over the intermediate sheltered intracoastal waterways. It handles freight of all kinds—low, medium and high grade. Operation of the barge line since the close of the war has not until recently resulted in a material direct return on the investment. The reasons are many, but essential equipment was lacking and joint rates with connecting railroads were not existent. Conditions are constantly improving, particularly in the rate situation. During the seven months ending July 31, 1925, the corporation handled 763,620 tons of commerce, and during the same period earned approximately 4 per cent. on its investment over and above operating expenses and depreciation charges. In addition to this showing, the net results to the people of the United States up to the present are the salvaging of a potential war loss of some seven million dollars and an annual saving in freight rates of more than a million dollars.

New Waterway Projects.—By the act of March 3, 1925, Congress adopted eleven projects for inland waterway improvement, besides six for Great Lakes harbors. This includes both new projects and the extension of existing ones. The most important of the inland waterway projects is the 9-foot intracoastal canal from the Mississippi to Galveston Bay, at a cost not to exceed $9,000,000. This serves to tie the various waterways of this section to the Mississippi system with an adequate channel, and when completed will permit direct movement between the great industrial and oil producing areas of eastern Texas and the Mississippi and Ohio Valleys.

During the fiscal year 1925 the Corps of Engineers completed and submitted to Congress twenty-six reports on proposed new projects for inland waterways. Of these, nine reports were favorable for improvement, and seventeen were unfavorable.

The following major proposals for new or extended inland waterway developments are now up for study, recommendations thereon not having been formulated:

Deepening and canalization of the St. Lawrence River and the connecting Lake channels, so as to give a through route for ocean vessels from the Atlantic to the Great Lakes. Under technical investigation by an international board of six engineers, of which the three American members are officers of the Corps of Engineers.

A ship canal across New York from the Hudson to the Lakes, with a similar intention of opening the latter to ocean traffic. Under investigation by a board of five Engineer officers.

A barge canal between the Ohio River and Lake Erie.

A barge or ship canal across New Jersey from the Delaware River to New York harbor.

Extension of the federally improved Atlantic intracoastal system from Beaufort, N. C., to Cape Fear River, and from Jacksonville, Fla., to Miami.

A modification of the present uncompleted project for the Mississippi between Cairo and St. Louis, to provide a 9-foot channel; together with several hundred other studies of varying importance.

PORTS

List of Ports.—A port channel is distinguished from an inland waterway in being used primarily by vessels operating on the open sea. Many channels are used for both purposes, and it is not always possible to draw an exact line between the two classes.

The agencies and procedure for improvement of port channels are the same as those described above under "Inland Waterways."

The principal ports of commercial importance at the present moment are given below, arranged geographically:

New York, the major port of the nation, handling nearly 25 per cent. of our foreign commerce, and especially notable as the principal port for the foreign and coastwise movement of high-grade package freight.

Other major northeastern ports: Portland, Me., Boston, Philadelphia and Baltimore.

Secondary northeastern ports, notably Providence and the other southern New England ports, whose principal commerce is inbound coal and petroleum products, and coastwise miscellaneous traffic with New York.

Norfolk and Newport News, primarily coal shipping points, both to foreign destinations and coastwise to New England and other northern ports.

Major South Atlantic ports: Wilmington, N. C., Charleston, S. C., Savannah and Jacksonville, with a growing general commerce in some cases, but specializing on bulk commodities. To these should perhaps be added Miami, a coastwise port whose channel is not fully deepened, but which has made tremendous progress with the growth of the Florida peninsula.

Major Gulf ports: New Orleans, with a very large general commerce; Houston, Galveston and Texas City, with a large commerce in grain, petroleum products, cotton and other commodities; the Sabine ports, primarily oil shippers; and Mobile.

Other South Atlantic and Gulf ports: These include Fernandina, Tampa and South Boca Grande, fertilizer shippers; Freeport, Texas, sulphur shippers; Key West, primarily a carferry port; the not yet complete port of Corpus Christi; Brunswick, Pensacola, Pascagoula, Gulfport, and others.

The major Pacific ports: Los Angeles, San Francisco, Portland, Oregon, Seattle and Tacoma. Los Angeles has developed a tremendous commerce, and in 1923 was, in tonnage, the second salt water port of the country; most of its tonnage was, however, local outbound oil and inbound lumber. The others are ports of general commerce.

The secondary ports of the Pacific, including San Diego, several California oil ports, and the lumber ports of the northwest.

The ports of the Great Lakes are not listed here, being really a part of an inland waterway system.

Of the major ports mentioned above, a few have channels with improved depths as great as 40 feet. These are for special traffic, such as the largest Atlantic and Pacific liners and the largest oil tankers. In general, the standard depth which is being provided and maintained for ports of general commerce is 30 feet at mean low water. This is ample in nearly all cases. Statistics show that of all vessels passing through the Panama Canal in 1920 about 99 per cent. drew not over 30 feet, and the same general rule applies for the shipping of the world. Small ports handling a coastwise business only are being maintained at depths of from 18 to 25 feet, and the numerous fishing ports, or ports on sheltered waters, such as Chesapeake Bay, often have channels of 12 feet or less.

New Port Projects.—Including new projects and extensions of existing projects, there were adopted by the river and harbor act of March 3, 1925, twenty-nine new projects for improvement at ports. The most important new port provided for is the 27-foot channel to Albany, N. Y. During the fiscal year 1925, seven reports on proposed port projects were submitted by the War Department to Congress. Of these four were favorable for improvement and three were unfavorable.

Port Facilities.—The period following the World War has been one of great activity in port organization and port development. The Army supply bases built at Boston, Newark, Philadelphia, Norfolk, Charleston and New Orleans have been leased for commercial shipping. The dry docking and repair facilities provided for the Emergency Fleet have also proved of great value to merchant vessels, particularly on the Atlantic and Gulf coasts, where some ports were previously without such facilities. In general our ports now have adequate facilities except for a few of the very largest Atlantic passenger liners, which can only be docked at the U. S. Naval dry dock at South Boston.

Active construction of piers and wharves has been in progress in most of the established ports; other ports have organized, and are contemplating improvements; and some localities not now ocean ports are establishing facilities for such business.

The Port of New York Authority, formed jointly by the states of New York and New Jersey, has been carrying on extensive investigation with a view to coördination of the rail and water facilities of the Port of New York, and has already accomplished the unification of one of the proposed belt lines in New Jersey. The City of New York has added twelve piers, built at Staten Island, and has improved many others. Port Newark has increased the facilities of New York Harbor by the development of ocean terminals, and further extension will be provided when a project at Jamaica Bay, now in an incipient state, has been completed.

Commodious piers have been added to the well equipped waterfront of Philadelphia. The facilities at Norfolk have been increased by the construction of coal loading piers of great capacity and high efficiency, of other wharves, and of a large grain elevator. Wilmington, Del., has completed a modern terminal capable of docking several ships at one time. Notable waterfront activity is shown at Mobile, Ala., where an extensive program of terminal construction is under way. Miami, Fla., has also found necessary a considerable expansion of its facilities. Houston, Texas, once an inland city, has in recent years developed on an artificial ship channel an extensive port, handling a large tonnage of oil, cotton and miscellaneous freight. On the Pacific Coast there has been a considerable expansion of facilities, notably at Los Angeles, where the commerce has increased more than ten fold in five years. San Francisco, Portland, Oregon, and Seattle have also found it necessary to provide large additions for their waterborne traffic.

Somewhat less extensive, but nevertheless important additions to waterfront facilities have been provided at Portland, Me., where a state pier has been built, at Boston, Baltimore, Charleston, S. C., Jacksonville and Tampa, Fla., San Diego and Richmond, Calif., and Tacoma, Wash.

Plans have been, or are being, made, or work is in progress, for new developments at Savannah, Ga., Corpus Christi, Tex., Oakland, Calif., and Lake Charles, La.

Mediums for the interchange of ideas covering port development are furnished through the American Association of Port Authorities, the Pacific Coast Association of Port Authorities and the magazine "World Ports."

DIVISION X

PUBLIC SERVICES AND UTILITIES

PUBLIC SERVICE COMMISSIONS

By John Bauer
City Law Department, New York

Creation. — Active regulation of public utilities is a development of the past twenty years. It began with the passage of the New York Public Service Commissions Law in 1906, and then extended rapidly throughout the country so that to-day it exists in practically every state of the Union.

In most of the states regulation is carried out through the instrumentality of a commission known either as Public Service Commission, Public Utilities Commission, Railroad Commission, or under a similar title. In a few states regulation is carried on without a central commission; each municipality is vested with authority to fix utility rates within its own boundaries, under the general limitations of the state public-utility act.

The utilities subject to regulation are industries upon which community life is chiefly dependent, and for that reason are deemed to be vested with a public interest. They include railways, or bus lines, electric light and power, gas, water, telephones and railroads. To a large extent their service is confined to municipal territory; but in most instances the same company operates in several municipalities. Regulation, therefore, is primarily a state and not a local function. Some utilities, however, operate in more than one state and involve interstate regulation. This applies especially to railroads, and their regulation has been reserved to the Interstate Commerce Commission, except in such matters as are plainly of a local or an intrastate character.

Rates.—Regulation has included the making of rates, the supervision of service and operation, the prescribing of accounts, the control of capitalization and intercorporate relations. Its general purpose is to safeguard the recognized public interest in the utilities, which distinguishes them from ordinary business. The efforts of regulation have, however, centered principally around rate control. Unfortunately the period since active regulation has become established, has been characterized by rapid price changes, affecting not only the investment in utilities but also the operating expenses and taxes. From 1905 to 1913 there was a slow upward movement of prices. Then came the war which was attended by a series of rapid rises, reaching the peak in 1920. Then there was a sharp fall, and a considerable fluctuation since. At the present time average prices are about 60 per cent. above the 1913 level and about 86 per cent. above 1905 when regulation was started.

Because of these rapid changes no existing rate could continue long before it became unsatisfactory either to the company or the public. With the changing conditions, adjustments in rates were necessary, and with every attempted adjustment the divergent public and private interests came into conflict. The earlier part of the period was characterized by efforts to adjust rates to the newer standards that had been established through the statutes, while the latter period has been subject to litigation in the companies' attempt to raise rates to the higher price level.

Throughout the twenty-year period the commissions have not had definite standards by which to fix reasonable rates. So far as the bulk of operating expenses and taxes are concerned, the problem has been fairly simple; practically the actual costs as reflected in the books of the companies have been taken as a basis for rates.

Return on Capital.—As for return on the investment, or compensation to those who furnished the capital, the problem has been difficult and has caused expensive and often bitter litigation.

The general rule is that the companies or the investors are entitled to a fair return on the "fair value" of the property used for the public service. But the difficulty with which the commissions have struggled is the proper measure and practical determination of such "fair value." Under conditions of fairly level or unchanging prices it could be assumed that "fair value" is equivalent to net prudent investment in the properties, which would be shown by the accounts if properly kept under commission jurisdiction. But such a standard, that "fair value" is determined by investment, was never definitely established. Consequently, with the rapid rise in prices since 1913, the companies have naturally sought a return upon the much higher range of reproduction cost; while the public representatives have urged the actual investment basis.

This controversy is not settled yet, and is the cause of growing dissatisfaction with commission regulation. After a twenty-year period we are still struggling without a definite standard on which to fix rates; every case involves dispute as to both principles and facts and accentuates the conflict between the public and the companies.

Appraisals.—To those who have had an active part in regulation it is clear that rate making cannot be effectively realized without a definite basis which rests upon clear principles and exact facts. In order to put rate regulation upon a workable basis an appraisal of the properties is necessary, so that the valuation of all existing facilities shall be determined once and for all, without subsequent readjustment on account of changing prices or other conditions. This amount would then be taken upon the books of the company concerned, and thereafter only actual additional investment added. If this were done, the entire basis of return would rest upon exact facts subject to accounting control. The machinery of rate regulation would become an accounting matter, so that the commission could determine at any time without elaborate hearings whether particular rates are excessive or inadequate. The rights of the consumers as well as of the investors would be exactly defined, and the facts to administer such rights in a practical way would be automatically determined.

The struggle over rates has consumed so much of the Commission's time and forces that little has been done in the more important function of regulation; in promoting better service; and in directing improvements in facilities and methods of operation. It is in this field where the commissions, if they were relieved of the unwieldy rate methods, could exercise the greatest public service.

Administration Status of Commissions.—Among the developments in recent years which have grown out of the extensive rate litigation, is the rather glaring contradiction of the commissions' duties and responsibilities. In our form of government three distinct departments are recognized: the legislative, administrative, and judicial. Each has its particular scope. The first determines matters of public policy and prescribes measures for the public welfare. The second is responsible for carrying out and administering the legislative mandates. The judicial body decides between the particular interests that may be affected in the administration and in the application of the laws.

The commissions combine all three functions. As for rate making, this represents in the first instance the exercise of legislative power; it is *per se* a legislative act. But the commissions are concerned also in administering their own orders, and particularly in passing judicially upon the effect of such orders. In making rates they not only act as legislative agents in the public interest, but simultaneously sit in judgment on the legal rights of the companies and the investors.

Such a double responsibility was never contemplated in our government, and is difficult to maintain. Faced with such clashing functions, commissions are always tempted not to do anything unless prodded either by the companies or by public bodies that have no judicial responsibility.

Municipalities as Litigants.—Out of this conflict has come the widespread feeling that the municipalities should have the right to appear in all regulatory matters so as to present directly the public interest. In all the cases before the commissions the companies are represented by their own counsel to urge their sides of any matter under consideration. But there has not been such a general recognition of the municipalities to represent the public side. The commissions' double function appears to be unavoidable, but to meet the situation the municipalities are seeking a recognized status to represent the *public* side, as counsel of the companies are privileged to urge the *investors'* part of any utility matter.

Personnel.—Another subject that has received extensive consideration is the personnel of the commissions. There has been a growing conviction that the commissions have been subject to too much political influence, and that appointments should be removed entirely from the pale of politics. Only persons with suitable qualifications and experience should be appointed to commissionerships, with a period of service not affected by changing political control. The same standards should apply to all technical departments. The engineers, lawyers, accountants, statisticians, etc., should be appointed and promoted only because of their professional fitness. Moreover, salaries should be paid throughout so as to retain a trained personnel and to offer a stimulus to professional zeal in behalf of the public.

The now widely prevalent system of political dependence, lack of tenure, and inadequate salaries has frequently had a demoralizing effect upon the regulatory bodies. Even some commissioners themselves during their terms of office have had their eyes not primarily upon their duties under the statutes, but upon what they would do after they leave office. Many have found comfortable posts with the companies which they had been previously regulating. Likewise, technical men have found inadequate professional opportunities with the commissions and could obtain reasonable personal advancement only from corporate connections. Hence often engineers, accountants, lawyers, and others, while performing their duties for the commissions, have had their attention upon a possible later connection with the companies. Naturally in such a state of mind they could hardly perform their duties as contemplated by the statutes, or as desired under proper professional standards.

The Future.—These difficulties have developed under rapidly changing conditions and during the comparatively short time that the idea of regulation has spread throughout the country. When important new principles or policies are widely adopted during a short period of years, grave problems are inevitably encountered. Time is required for more precise and equitable methods and procedure. The difficulties of utility regulation are clearly realized by large numbers, and steps are being taken in different parts of the country to remove them. But the function itself is firmly established and is unlikely to be abandoned. Utility commissions promise to be of increasing importance and service in our governmental machinery.

MUNICIPAL OWNERSHIP

By H. M. Olmsted
Consulting Engineer and Accountant, New York

DEVELOPMENTS

The year 1925 has not been marked by great changes in the field of municipal ownership nor by a clear preponderance of indications, one way or the other, that the municipal ownership idea has gained or lost strength during the year.

Electric Developments.—The most active sector in the field has been the electric light and power industry. The general development of this public utility has continued to be rapid, and the question of public ownership has received much attention. The increasing concentration of the industry into a few very large systems, and the extension of physical interconnection which has accompanied the financial consolidations, have tended to emphasize the disadvantage in cost of production to which a small generating plant, whether privately or publicly owned, is subject as compared with an interconnected power system drawing from large plants that can produce power at low cost. The past year has seen the shutting down of a number of small municipally owned generating plants as the communities served by them have either become part of a privately owned electric power system or have purchased power from a nearby private company or municipality for distribution under municipal operation.

Transfer from Public to Private.—Cities reported in various journals to have sold their electric plants to private companies during the year include Oxford, Ohio; Brown City, Mich.; Dane and Lime Ridge, Wis.; Thebes and Vandalia, Ill.; Castana, Little Rock, Ricketts and Schleswig, Iowa; Clinton and LaBelle, Mo.; Kiowa and Okehmah, Okla.; Ballinger, Texas; Clovis, N. M.; Mayfield, Ky.; Fayetteville, Tenn.; Blackshear and Meigs, Ga.; and Madison, Fla. The most, if not all, of these are now to be served by intercity systems. Certain other cities are reported as taking service via transmission line from some other locality, but not selling: Monticello, Ark., leased its municipal plant; Mt. Sterling, Ohio, and Pierson, Iowa, evidently abandoned theirs, Reading, Mass., although deciding to purchase power, held its municipal plant in reserve.

New Municipal Projects. — Cities where municipal ownership projects are reported include Colorado Springs, Colo., which had acquired the private company's electric property and on July 1 entered upon operation of the system, which will comprise two small hydroelectric generating stations and a larger steam plant which the city is constructing. Later in the year, through action of the City Council, the city acquired the gas holdings of the company, assuming operation on October 1. The purchase was financed by income warrants. Loveland, Colo., acquired certain property of the private company in that city by condemnation for use in connection with the plant being built by the city. Muscatine, Iowa, completed a municipal plant at a cost of some $425,000, the city formerly having been served by a private company obtaining current from a plant at Davenport. Chippewa Falls, Wis., voted decisively for the acquisition of a dam site and the local company's distribution system, but a plan for Chippewa County to undertake the development as a county-wide project was blocked by the adverse action of the state senate on a bill to permit counties to acquire water-power and electric plants. Hart, Mich., was enabled to proceed with a municipal hydroelectric enterprise by the dissolving of an injunction against the bond issue for that purpose. Stratford, Iowa, heretofore supplied by a private company, voted bonds to obtain service from the municipal plant at Webster City, by building a transmission line. Owatonna, Minn., completed its municipal plant and reached an agreement with the private company for the city to take over the power and lighting business within the city limits. Bloomfield, Neb., and Conetoe, N. C., are reported as constructing municipal plants, and Brookville, Pa., Rockwood, Pa., and Westfield, Neb., as taking steps to acquire the private plants. Aberdeen, Wash., and Eugene, Ore., are referred to later in connection with water supply.

Pacific Coast Developments.—The Moccasin power plant of the city of San Francisco, with a rating of 80,000 kva., a part of the Hetch-Hetchy municipal water and power project, was placed in operation in the middle of 1925, under a temporary arrangement for the distribution of the current in San Francisco by the Pacific Gas & Electric Co., which already supplies the city. In the election on November 3, the winning candidates were pledged to a municipal distribution system. In Los Angeles a large amount of work was done during the year in betterments and extensions to the distribution system, the construction of new substations and the unification of the municipal system as augmented by the property of one of the competing companies previously acquired. Plans for a stand-by steam station were also instituted in the latter part of the year. The program for the year was planned to involve $9,750,000; a bond issue of sixteen millions had been voted prior to 1925. On April 9 the California Legislative Assembly defeated a proposed constitutional amendment providing for the taxing of publicly owned utilities in the same manner as privately owned ones.

Seattle continued with its new Skagit River hydroelectric development, which began rendering service in 1924. The Puget Sound Power & Light Co. succeeded during the current year in preventing the Seattle municipal system from selling power outside the city limits.

EXTENSIONS AND TRANSFERS

Extensions.—The municipal electric plant at Cleveland, Ohio, serving part of the city, was the subject of critical discussion and investigation during the year. A bond issue of a half-million dollars for extending it was approved at the polls on Nov. 3. Other cities where extensive additions or improvements were reported during the year included Hamilton, Ohio, where the City Council authorized $527,000 of a bond issue previously voted, for the construction of a new plant; Grand Island, Neb., where $750,000 was voted by the Council for the municipal electric, water and ice plants, and Dunkirk, N. Y., which was preparing to issue $200,000 of bonds for a new electric plant. The municipal plant at Fort Wayne, Ind., added an automatic hydroelectric station at the Maumee River dam. Both the municipal and the private plants in that city filed reductions in lighting rates to five cents per kilowatt-hour.

Transfers prevented.—Among cities where decisions were made to retain the status quo as to municipal ownership of electric establishments, Beatrice, Neb., Lone Wolf, Okla., Opelika, Ala., and Whiting, Iowa, voted to continue municipal ownership; Culpeper, Va., Faribault, Minn., and Prairie du Chien, Sparta and Superior, Wis., voted not to adopt it. In Boston Mayor Curley vetoed, in November, a resolution of the City Council to establish a municipal lighting plant, largely on account of the tremendous expenditure involved; he recommended that relief in rates should continue to be sought through the medium of the State Department of Public Utilities.

SUMMARY OF OPERATIONS

Information covering changes in the entire field during the current year is practically impossible to obtain. During the year, however, the Bureau of the Census issued its 1922 census report of the electric industry, a similar report being issued every five years. This showed that the number of municipal electric light and power establishments in 1922 was 2,581, or 40.6 per cent. of the total number of establishments; and that both the number and the percentage had been continually increasing. The percentage of output had not shown this continual increase. In 1922 the output of municipal plants, including those purchasing power as well as those generating it, was 4.9 per cent. of the total for all establishments; in 1917 it was 4.0 per cent; in 1912, 4.6 per cent.; in 1907, 4.9 per cent. (in which year purchased power was not reported), and in 1902, 7.8 per cent (in which year no division between generated and purchased power was shown). The kilowatt-hour output of private plants increased 60 per cent. from 1917 to 1922; that of the municipal plants increased 98 per cent. Publicly owned plants were shown as having 6.3 per cent. of the total capacity of generating stations—a decrease from the percentages of previous years. Of the 2,581 municipal establishments, 1,739 generated all or part of their power, the remaining 842 purchasing all power. The numerical gain in number of municipal plants for the five-year period (1917-1922) was 263, while the number of private plants decreased 449. The average capacity of municipal generating plants increased 52 per cent. per plant during the period; the average capacity of private plants increased 95 per cent., the average private generating plant having 9.8 times the capacity of the average municipal plant, in 1922.

The McGraw Central Station Directory, an annual publication, does not contain a summary by ownership, but was stated by the National Electric Light Association to show 2,125 municipal plants in the year 1924. A count of the McGraw directory for 1923, covering data for 1922, by the writer, shows 2,048 municipally owned electric systems, which indicates an increase in the number of municipal plants between 1922 and 1924. With regard to the list of stations in 1924, the National Electric Light Association, in its book "Political Ownership," states, "There are 45 cities over 10,000 population served exclusively by municipal plants making and distributing all electricity used in the community. There are 13 additional cities which distribute all electricity but which purchase their power from outside companies. There are 82 other cities with municipal systems in more or less active competition with companies. There are 625 cities of over 10,000 population served by companies."

The Ontario Hydroelectric System.—A mixture of municipal and provincial ownership—continued to be a bone of contention in the discussion of public ownership in the United States. Early in the year, under the auspices of the Smithsonian Institution, a report by S. S. Wyer was published entitled "Niagara Falls: Its Power Possibilities and Preservation," which consisted largely of an attack upon the Ontario system. This was given wide publicity and in turn brought out much comment adverse to the report, including a spirited refutation by Sir Adam Beck, Chairman of the Hydro-Electric Power Commission of Ontario from its beginning until his death on August 15, 1925. Premier Howard Ferguson also came out in opposition to the Wyer report.

WATER SUPPLY

In this orthodox field for municipal ownership of utilities, the year marked the union of nine of the cities on the east side of San Francisco Bay, including Oakland, Alameda and Berkeley, to form a utility district for the purpose of securing an adequate water supply, the present service being from a private company. A $39,000,000 bond issue was voted to obtain water from a reservoir to be constructed at Lancha Plana, 87 miles away. Another outstanding event was the passing of San Antonio, Texas, from private to public ownership, this being one of the few large cities in which the water supply system had continued to be privately owned. The purchase price was $6,500,000, financed by water revenue serial 5½ per cent. bonds running from one to forty years, arranged through an intermediary group of bankers. Local criticism was directed against the financial arrangement as involving too high a purchase price and rate of interest.

A special election was held in April at which the bond issue carried by a large majority. Yakima, Wash., on Oct. 15, voted 20 to 1 to construct a municipal water system. In some cities the question of water supply was combined with that of hydroelectric power. Los Angeles, for example, on June 2, voted six to one in favor of a bond issue of $2,000,000 to be used in connection with the project of an additional water supply from the Colorado River; this was believed to be a step toward the obtaining of electric power from the same source, for the municipalities of southern California, as contemplated by the proposed Boulder Canyon development. Aberdeen, Wash., had received a set-back in its struggle to institute a hydroelectric development on the Wynooche River through a court decision that it was not legal to combine water supply and electric power in one proposition, as had been done in connection with the $2,000,000 bond issue voted in December, 1924. Accordingly the issue was divided, and on March 24, 1925, bonds in the amount of $700,000 were voted for the water supply project. The "Electrical World" reported on June 20 that the private company in Aberdeen had reduced its rates about 20 per cent. to induce the city to abandon its hydroelectric plans; on Sept. 12 that the State Supervisor of Hydraulics had granted the city an extension to Sept. 1, 1926, to begin the water-power project, work having been begun on the municipal water works; and on October 3 that the Federal Power Commission had denied applications from both the city and the company for rights on the Wynooche River. Eugene, Ore., applied to the State Engineer for appropriation of water from the McKenzie River for municipal water-supply and power development.

MUNICIPAL STREET RAILWAYS

Chicago.—In street railways municipal ownership interest centered about certain of the large cities. On April 7, the voters of Chicago, by a decisive majority at a referendum election, rejected a proposal for ultimate municipal ownership and operation of the entire local transportation system. The existing surface lines were to be purchased for $163,000,000 and the elevated lines for $85,000,000, through the sale of Municipal Railway Certificates, the principal and interest of which were payable out of earnings. Subways and other extensions were to be similarly financed, the total expenditures for purchase and new construction over a twenty-year future period being estimated at between $600,000,000 and $700,000,000. A sufficient rate of fare was to be established to pay for the cost of service together with interest and amortization as to the certificates. A Municipal Railway Board was to be established to control the unified system; it was to consist of three members appointed by the Mayor, with Council approval, three by a committee representing the owners of certificates, and three by agreement between the Mayor and the committee. The proposal had the endorsement of the Mayor and the Council majority, many civic organizations, several newspapers, and some of the most prominent and conservative bankers of the city, but was strenuously opposed by many municipal ownership proponents, including the Hearst newspapers, the Chicago Federation of Labor, and certain prominent councilmen and civic leaders, who charged that the purchase prices were excessive and that the plan failed to provide a sufficient measure of public control.

Detroit Situation. — In Detroit, which has the largest unified municipal street railway system in the country, the situation was marked by the discharge of the street railway manager, who had been closely identified in various capacities with the municipal enterprise since its start, and also of the auditor, by the incoming mayor, about the middle of the year. The new auditor shortly issued a statement, which obtained considerable publicity in trade journals and newspapers, to the effect that the system's reserves were not fully represented by liquid assets; that the reserve for claims was inadequate as set up; that a five-million-dollar bond issue voted in 1923 had been largely exhausted in advance; and that a deficit of more than three millions existed.

A hearing was held concerning the charges, in refutation of which statements have been made that the reserves had been handled in accordance with approved practice in the industry, and that three and one-half millions of bonds could still be sold under the bond issue to retire short-term loans. The new auditor's report for October 31, 1925, shows an operating balance for the preceding twelve months, after taxes, interest and amortization, of over half a million dollars, and, on the balance sheet, a surplus of $133,344.29.

Other Propositions.—A commission of the Massachusetts legislature has been studying public ownership as a means of financing the needs of the Boston transportation system, now privately owned but operated by public trustees.

In Los Angeles a committee of engineers representing the state, the city and the two companies reported in favor of consolidation of street railway service under municipal ownership.

In San Francisco, on November 3, the initiative to purchase the Market Street Railway, competing with the municipal lines, for $36,000,000 was defeated eight to one.

In New York City the overwhelming election of James J. Walker, the Democratic candidate for Mayor, on November 3, was generally taken to mean the continuation of that city's public ownership policy, particularly in rapid transit.

In Michigan a law was passed requiring municipally owned utilities to adopt uniform accounting and annual reports which would be similar to those for private companies, under the direction of the Public Utilities Commission.

In the other public utility fields besides those mentioned above municipal ownership activity was very slight during the year.

PARKS

BY HENRY V. HUBBARD

PROFESSOR OF LANDSCAPE ARCHITECTURE, HARVARD UNIVERSITY

Organization of Park Betterment.—In 1925, as in 1924, the most important contribution towards the development of parks in this country is the work of the National Conference on Outdoor Recreation (established by invitation of President Coolidge in 1924), through its numerous active committees, representing the various organizations and professional bodies concerned in public recreation.

Among the studies which are in progress are surveys of municipal and county park systems, recreational surveys of state and of federal lands, coördination of federal land policies in relation to recreation, and a survey of the recreational value of highways.

There has also been progress in clarifying the conception of the respective functions of the national park in which scenic values primarily are preserved, of the national forest with its secondary function of offering recreational opportunities in suitable areas, and of the state park as preserving characteristic local scenery and offering an accessible place for city dwellers who wish really to get out in the open country.

It is hoped also that the studies of the National Conference on Outdoor Recreation will differentiate in the public mind the function of *parks*, for the enjoyment of landscape, and of *playgrounds*, for the conduct of sports and games.

State Action.—An outstanding feature of the year is the strong movement behind the slogan "A State Park Every Hundred Miles," backed by the National Conference on State Parks which held its fifth annual meeting in the Spring of 1925 at Skyland, Virginia.

With the aim of supplementing the recreation opportunities of the national parks, and to offer large near-by play spaces to citizens of states in which no lands of national-park rank exist, many states are initiating state park programs of far-reaching importance. In the east New York State has been especially notable, following up the successful Palisades Inter-State Park with coöperation in a park system plan for the Niagara region centering about Buffalo and including Erie and Niagara counties.

In 1925 the mid-west states have been particularly active in improving park and forest areas. Indiana is adding a new park in the northeast corner; Illinois is creating a new conservation commission with funds to acquire forest and recreation areas; Ohio through the State forester is securing scenic areas in the southwestern section; Michigan is still adding, largely by gift, to its total of 53 areas, the largest number of any state, and Minnesota's system is also recently increased by gifts; Wisconsin has made additions, and is creating a northern forest park of nearly a hundred thousand acres; Iowa has added to her fine river-gorge and lake parks.

The movement for parks is also active in the southern states, following the lead of Texas, which has 51 gift parks. In North Carolina, Tennessee, and West Virginia the legislature has created a state agency to promote and develop parks. Many other states have studies in progress looking to the enactment of legislation for parks or for coördinating existing areas. In Massachusetts, a committee on open spaces has recently been formed to point out future needs in a region famous for its early contribution to the idea of organized park systems.

National Action.—The most striking national park project before the public is for the Appalachian National Parks in the Shenandoah and Great Smoky Mountain areas. An act of Congress (Feb., 1925) authorizes the Secretary of the Interior to determine boundaries with a view to acquisition. Other bills and resolutions relating to parks, forests, and national monuments have become laws in 1925, and these are listed in the valuable pamphlet *Organization and Program*, July, 1925, of the National Conference on Outdoor Recreation, where are also described the park survey studies already mentioned.

A record of park progress for the year should include a reference to the valuable information contained in the bi-monthly magazine *Parks and Recreation*, the official organ of the American Institute of Park Executives, now published in greatly enlarged form. In its pages current news of national, state, county, and municipal parks may be followed. The activities of the Playground and Recreation Association of America in directing the survey of municipal and county parks are important, as well as its extensive playground improvement program [for an account of playground progress, see the article Recreation].

Cities and Parks.—Among the cities where especial achievement in park-making is reported, Chicago is important, with its South Park waterfront developments; and in the New York region, Westchester County (N. Y.) and Union County (N. J.) have made notable recent progress in supplementing the already overworked park areas accessible to the metropolitan center. St. Louis with its Forest Park and Denver with its Mountain Park may be mentioned for the striking successes of their parks in the community life, which are repeated in other forms in many cities throughout the country. The development of adequate outer parks for our National Capital is a matter of concern to the whole country. Now that a National Capital Park Commission has been authorized by Congress, and the Committee of One Hundred on Plan of Washington (led by the American Civic Association) is strongly behind a program of park acquisition, real progress is expected in the coming year.

STREET TRAFFIC

By Ernest P. Goodrich,
Consulting Engineer, New York

INCREASE IN TRAFFIC

The present incidence was very largely upon improving traffic conditions and its best regulation to secure greater speed and safety and to reduce congestion.[1]

Animals.—While during the past few years the horse has hardly held its own in numbers on farms and in cities, the rapid increase in the use of automobiles has created a traffic condition for which modern communities were not designed.

The Bureau of the Census gives the following figures as to the number of horses, mules, and burros on farms and not on farms:

Year	*On Farms*	*Not on Farms*	*New York City*
1900	...	3,126,636	130,695
1910	6,605,746	3,469,662	129,370
1920	6,997,289	2,098,846	57,751

Automobiles.—The automobile registration in the United States has grown as follows:

Year	*Passenger Cars*	*Trucks*	*Total*
1920	8,225,859	1,006,082	9,231,941
1921	9,346,195	1,118,520	10,464,715
1922	10,864,128	1,375,725	12,239,853
1923	13,479,608	1,612,569	15,092,177
1924	15,460,649	2,131,332	17,591,981
1925	17,200,000 (est.)	2,300,000 (est.)	19,500,000 (est.)

While traffic tallies show that street traffic has not increased in the same proportion as has the registration, it is still evident that it is the accelerated increase in the use of motor vehicles which has created the traffic problem.

TRAFFIC REGULATION

City Ordinances.—During 1925 no new ideas were incorporated in traffic regulations enacted during the year. Many cities revised their ordinances (e.g., Cincinnati, Ohio, Providence, Rhode Island), making them more detailed and rigid and providing for their more exacting enforcement. To the latter end special traffic courts were created (e.g., Washington, D. C.), and existing ones were enlarged (e.g., New York City). The amended ordinances have usually included the pedestrian along with the vehicle driven within the scope of their regulations.

Investigations.—The year 1925 stands out as a year of study and experimentation. In December, 1924, Secretary Hoover of the Department of Commerce called a National Conference on Street and Highway Safety. The results of its work were so marked that its committee was continued to report to a second conference planned to be held early in 1926. Advance information of the report of the committee on costs of congestion is to the effect that annual losses which aggregate $2,000,000,000, or $20 per capita, due to street traffic congestion, can be saved by careful study, planning, and administration. With these facts and conditions generally known to engineers and traffic officials throughout the country, many lines of investigation have been followed, many plans prepared, and much work has been done in the way of actual accomplishment.

Traffic Commissions.—Special official traffic commissions have been created in a number of cities (e.g., Washington, Los Angeles, Pittsburgh,

---

[1] The estimates for 1925 were made by the writer.

Detroit), with technically trained men in charge or as staff. These commissions have generally commenced their work by making a detailed traffic survey upon which scientific basis their conclusions might be based. Other cities (e.g., Buffalo, Philadelphia) have appointed expert consultants who are making studies, and in many instances initiating changes in methods and in details of traffic regulation. Many other cities have been and are being studied with great detail by official and unofficial groups such as City Plan Commissions, Mayor's Citizen Committees, Chambers of Commerce, etc. (e.g., Dayton, Cincinnati, Providence, Albany, Chicago). State Highway Commissions have aided the solution of the urban problem by studying the best methods of detouring through traffic around congested centers. For example, Missouri and Ohio are suggesting more or less complete detours, while Wisconsin works alternative routes through and around the dense traffic areas. Springfield, Mass., was one of the first cities to mark detours plainly.

THOROUGHFARES

Streets.—The city of St. Paul, Minn., has started a careful study of the details of street construction looking to the securing of greater safety for vehicles, by the enlargement of corner radii at street intersections and at the entrances to private grounds, for example. Other organizations are studying such problems as reduced curvature, improved grades, wider roadways on hills and on curves, cross-section profiles, better traction surfaces, the reduction in pavement cutting for pipes, and other improvements which will make it possible to expedite traffic movement.

TRAFFIC SIGNALS AND MARKERS

Signals.—The year has shown a considerable development of ingenuity in the creation of mechanical devices to assist in the control of street traffic. Flashing lights and steady rays of different colors, mirrors, direction waving, and information signs of many diverse characters have been patented, placed on the market and more or less widely advertised. Several cities of some size have also installed considerable numbers of mechanically controlled synchronized signals (e.g., Cleveland, Syracuse, New York City) and others have contracted for them (e.g., Washington) or are carefully studying the propriety of doing so (e.g., Albany, Chicago). The Chamber of Commerce of Cleveland sent a committee of city officials and others to study traffic control methods in a number of cities and reported strongly in favor (for reasons of economics and efficiency) of the installation of a comprehensive system of traffic control of this type.

In Chicago an improvement upon the synchronized scheme is being designed very similar to the installation in Los Angeles in that the signals are so "coördinated" as to make possible a continuous plan of traffic on all streets,—the vehicles traveling in groups at a predetermined speed, the groups being so spaced and related that those on intersecting streets move between the gaps of those on any given thoroughfare. So far as known this scheme was first publicly suggested at the National City Planning Conference in Cleveland in 1916, but aside from its partial application in Los Angeles, the proposed Chicago installation will be the first comprehensive application of a principle which should be a great improvement on the "stop-and-go" method employed elsewhere.

Routes and Stops.—Among numerous minor devices which have grown considerably in favor during the past twelve months the following may be mentioned,—the painting of pavement surfaces with lines to indicate pedestrian crossing points, isles of safety, and lanes of traffic (the state of Delaware having thus marked the center lines of 450 miles of state roads); the requirement that all vehicles come to a full stop as they turn into or undertake to cross heavily traveled boulevards and express and main arterial highways (colloquially known as the "boulevard stop" or "through traffic stop"); the further segregation in some places of types of use or size of vehicle beyond the restriction against trucks on parkways, best exemplified by the restriction of the use of the Victoria Bridge at Montreal by vehicles over 6 ft. 6 in. in width to the hours between 11 P. M. and 6 A. M.; the plan of segregation of fast moving vehicles on Connecticut state roads during days of big football games by requiring the slow vehicles to use back roads and that the fast ones operate at about 30 to 35 miles per hour; one-way streets have been designated in large numbers; and at many intersections, left-hand turns have been prohibited.

Regional Plans.—In connection with the formulation of city and regional plans, a large amount of study is being devoted to planning for the proper provision of future traffic requirements. Such studies are being made on a regional scale for New York, Philadelphia, the "Niagara Frontier," San Francisco, Los Angeles, and elsewhere.

PARKING CARS

Much discussion has occurred of the extremely difficult "parking problem." It is acutely before the administrative authorities of all communities and many experiments are being made towards its solution. Some contend that it is a public necessity that parking space be provided adequate for the desires of all. At the other extreme are many who contend that there is no valid reason why a community should provide "garaging space" for cars while away from their home garages.

The tendency indicated by traffic ordinances enacted during the year is in the latter direction, the parking time having been more and more restricted and applied to an increasing number of streets in many cities and towns. This has resulted in the exploitation of patented and other garaging devices. The ramp garage is the best known among the former class, while the suggestion of a gigantic public parking space to be constructed under Chicago's water front park and under parks in New York are suggestions of the latter variety. The action on the part of several department stores in half a dozen different cities during the year in erecting garages for the special use of their patrons is an interesting development.

CONFERENCES

Many agencies have been active in studying street traffic matters. The Conference on Street and Highway Safety called by Secretary Hoover gave an impetus to the matter. A second national Conference was arranged as a first outcome. In addition, a local conference was held in St. Louis, the American Engineering Council appointed a special committee of recognized experts to study the matter, the International City and Regional Planning Conference held in New York in April devoted a session to traffic matters, the International Police Conference discussed at some length matters of traffic regulation and passed several resolutions with reference to the subject, and the meeting of the Chamber of Commerce of the United States listened to papers on the solution of metropolitan traffic problems.

WATER SUPPLY

BY THEODORE REED KENDALL

ENGINEERING EDITOR, AMERICAN CITY MAGAZINE

Chlorination.—About fifteen years ago chlorine, either in the form of hypochlorite of lime or liquid chlorine began to be used for the sterilization of domestic drinking water because of its ability to destroy the microbes of disease. Today, close to 75 per cent. of the people of North America drink chlorinated water and the installation of chlorinators is standard practice throughout this country. No matter how pure a source of water may be considered, no consultant will recommend omitting chlorinating equipment any more than he would recommend omitting the fire department in a community. If the water is pure, the chlorinating equipment is always ready in case of emergency and where the water is of questionable bacterial quality the constant addition of minute quantities of chlorine completely destroys pathogenic bacteria.

There are probably 200,000 people alive today in North America who would have died from typhoid fever or other water-borne diseases were it not for chlorination. Over 6,000 installations of chlorinating equipment have been made in the United States, which include those used on municipal water supplies, those used to sterilize the effluent from sewage treatment plants, where such effluents enter streams which are later used as the sources of domestic water supplies or where the effluent flows near public bathing beaches and such equipment is installed for the sterilization of the water in swimming pools. It is interesting to note that the water chlorinated for municipal water supplies in the United States in one day would fill a 12-inch pipe five times around the world at its greatest dimension.

Iodide Protection Against Goiter.—A public health measure of absorbing interest and outstanding importance has gradually been introduced into this country during the last ten years and is now almost universally used in certain districts in the United States. In the prevention of simple goiter by the administration of minute quantities of any form of iodine, mankind possesses an effective prophylactic against thyroid enlargement, especially during those periods of life when it is most prone to occur. Simple goiter is an enlargement or swelling of the thyroid gland—a gland of internal secretion—which lies in the front part and somewhat to the side of the neck. It may involve either one or both lobes of the gland and vary in size from the normal which can scarcely be noticed to the pendulous form.

The enlargement of the thyroid, now generally known as goiter, has been recognized as an abnormal condition for many centuries. There is some evidence that as far back as 2000 B. C. the Chinese were familiar with it and discovered that the eating of seaweed and the thyroid glands of animals and the use of crude sea salt would ameliorate or cure the condition. Enlargement of the thyroid has been observed not only throughout a long period of history, but it appears widely distributed geographically.

North America has its well-marked regions where simple or endemic goiter is quite prevalent. The zone extends roughly from the basin of the St. Lawrence westward across the Great Lakes Region and northwestern United States to the Pacific Northwest, taking in neighboring Canada, especially British Columbia and Alberta. The States of Washington, Montana, Michigan, Wisconsin and Minnesota are quite heavily affected. Nests of goiter appear in western New York State, in the foothills of the Appalachian Mountains in northwest Pennsylvania and in western Maryland. In general, it is found most prevalent in mountain regions or on high plateaus and at some distance from the sea, although nests may appear at other places.

Report on Goiter and Its Prevention.—*The Manual of American Water Works Practice* mentioned below discusses the question of goiter and treatment through the public water supplies in twelve paragraphs which may be summarized as follows:

1. The infectious theory of the origin of goiter does not appear to present enough conclusive evidence to justify its acceptance.

2. Deficiency of iodine is the most important, if not the main factor in the development of simple or endemic goiter.

3. Goiter is prevalent in those regions of the world where there is a deficiency of iodine in the water and food and is rare where sufficient iodine is present.

4. The thyroid gland is the essential organ of the body that draws iodine and issues it for physiological purposes.

5. Deficiency of iodine in the thyroid due to insufficiency of intake

leads to overgrowth of that gland with the production of definite and characteristic symptoms and signs of disease.

6. Simple or endemic goiter may be easily prevented by administering minute quantities of iodine in any form, especially at those periods of life when it is most liable to occur—during pregnancy and adolescence.

7. Iodine may be supplied by fruits and vegetables or by potable waters, known to contain iodine. In goiterous regions the deficiency may be supplied by iodide in confection form, by means of iodized table salt or by means of treating the public water supply with small quantities of sodium iodide.

8. Iodine prophylaxis among school children of adolescent age is thoroughly justified and has proved of incalculable benefit. It reaches, however, but a fraction of those who should be receiving the benefits of iodine prevention.

9. The iodization of table salt is a big step in the wider application of prophylaxis against goiter and has many points to commend it.

10. The iodization of public water supplies in those places where goiter is shown to be prevalent should be a logical measure for the protection of the whole community. There is no more inherent reason why water should not be iodized than there is why it should not be chlorinated or treated chemically for other necessary purposes. This is, however, still in its experimental stage and there may be demonstrated methods of relatively greater value in goiter prophylaxis.

11. The whole matter of the prevention of goiter should be under the supervision of the health authorities of the community with the advice and assistance of the sanitary engineering department and the local medical profession.

12. The diagnosis and treatment of the different types of goiter should be undertaken only by skilled and well-qualified physicians and surgeons.

Select References.—The outstanding accomplishment of the past year in the water works field is the publication by the American Water Works Association of the *Manual of American Water Works Practice*, after several years of preparation. In June, 1920, the Association established its Council on Standardization which had among its purposes the stimulation and development of much needed investigation and review of various features of water works practice by committees and specialists. From fifteen to eighteen of these committees have been in active service since that time.

This book, which will be found helpful to all interested in water supply, has been prepared primarily for the three general groups of active water works officials: First, the members of water boards and commissions, who shape the general policies of the water works under their control; second, the salaried officials who manage and superintend the work; and third, the specialists who design, manage or supervise those parts of the work of a highly technical character. During the last year about 50 members of the American Water Works Association coöperated in drafting the material for the Manual, subdivided into eighty topics. The work of these members has been reviewed by various committees, resulting in a book which is the coöperative effort of over 300 active water works men.

POLICE

By Arch Mandel

Director, Dayton Research Association

Crime and Administration.—Changes in methods of police administration have come so slowly that one or two years' review of this field is describing a static condition. In the past few years there have been improvements in mechanical facilities,—signal systems, appliances for traffic regulation, the wider use of the automobile, and in a few instances, at least, the installation of radio broadcasting stations. But whether the police department has become a more effective crime reducing agency cannot be stated definitely, because there exists no basis of comparison. Records are lacking. With the growth of cities, with the elimination of isolated areas through the automobile and good roads, the resultant complexity of living may reasonably be expected to have caused an increase in crime, but whether the rate has increased is another question. It is certain, however, that the people of this country have never been aroused as now by the prevalence of crime.

Effect of the Automobile.—In the last few years, old problems confronting the police have been made more complex and new ones added. The underlying causes may be a matter of debate, but the immediate causes are the automobile and prohibition laws. The automobile has multiplied the traffic problem, the control of which has fallen to the police. The innumerable ordinances adopted in every city for the regulation of traffic have seriously taxed the resources of police departments, because of the diversion of increasing numbers of policemen from general crime prevention to this function. Whatever may be the effectiveness of the police in regard to crime, they have made possible the movement of traffic. Another problem added by the automobile is its use in the commission of crimes. With the aid of the automobile, it has become an apparently simple matter to commit robberies in broad daylight in cities large and small, and for the criminals to effect a successful escape. This has created a perplexing situation, which as yet has not been met satisfactorily.

Prohibition of the sale and use of liquor is the second important factor, which in the last few years has increased the difficulties of police administration. Every community seems to have a considerable proportion of its citizens that is especially interested in the enforcement of these laws and seems satisfied if strenuous efforts are made in this direction, regardless of the resources or attention given to general crime prevention. These laws should, of course, be rigidly enforced, and traffic must be regulated, but it must be recognized that the emphasis placed upon these two specific problems has greatly reduced the relative number of policemen available for general crime prevention and detection. In other words, police departments have had their problems multiplied without having their facilities proportionately increased.

Improvements in Crime Prevention.—The crime prevention methods of the police departments are still those of the monitor. Policemen are assigned to definite districts, which they must keep as free from crime as possible. Foot patrol, while still the prevailing method, is being gradually, though slowly, replaced by automobile patrol. This newer practice provides for the surveillance of patrol posts by two policemen in an automobile. They are able to cover a larger territory more effectively than the foot patrolmen. Another improvement adopted by police departments for crime prevention has been the establishment of booths or substations in outlying parts of the city, at strategic points. To these booths, equipped with telephones, are assigned two or three men, one of whom remains at all times in the booth, so that he can be reached and be available when needed in his district. The others patrol the vicinity, making frequent reports to the booth, thus increasing their availability for quick service.

Criminal Identification. — Another forward step taken as an aid to police departments is the establishment of a national criminal identification bureau in the Department of Justice of the federal government. Up to two years ago such an identification bureau was maintained in Washington by the International Association of Police Chiefs. The transfer of this bureau to the government and the assumption by the latter of this function with more adequate funds and better facilities at its disposal, should help greatly the apprehension of criminals, a greater number of whom than ever before are interstate in their operations. In this field of criminal identification, the gradual substitution of the finger print for the Bertillon measurement system has caused a wider use of identification methods. Finger printing is simpler and more economical to operate, and smaller cities, heretofore without any such facilities, are introducing them. This, of course, increases the probabilities of apprehending criminals.

Heads of the Police.—In the more fundamental practices of police administration, no changes can be noted. The chief difficulty has been, and still is, the frequent turnover in the head of the department with every change in the municipal administration. It is taken for granted that anybody can fill the position of police commissioner, and if the incumbent is honest, people are satisfied. Experience, knowledge, and ability are incidental. By the time a capable citizen realizes the intricacies of the job and the problems to be solved, and has an inkling of how to solve them, he gives way to a green successor. The latter, having ideas of his own, puts these into effect and frequently neutralizes the progress made under his predecessors. Progress in police methods, because of this, has been as steady as climbing a greased pole.

Philadelphia, New York and Detroit.—At this moment, Philadelphia, New York and Detroit, among many other cities, furnish examples of this problem. Apparently prompted with a desire to have an effective and nonpolitical police administration, the Mayor of Philadelphia in 1924 appointed General Butler, who was given a leave of absence from the Marine Corps for the purpose, as Director of Safety. Disregarding political ties and influence, the General reorganized the department and waged a strenuous fight against lawlessness, particularly the enforcement of prohibition laws. Precinct lines were rearranged to eliminate as much as possible the former ward basis and its resultant intrusion of ward politics. The General has just completed two years of service, and as this is being written, the Mayor has asked for his resignation. New York City, after a continuous administration under one police commissioner for the past eight years, will in 1926, have a new police head, with the usual changes in policy and possible upheaval. Since 1916 Detroit has had four police commissioners and is now seeking a new one.

Records.—In the matter of maintaining and applying accurate records as a basis for formulating policies and methods, police departments are backward. Health departments did not commence to make progress in their fight against preventable disease and a high death rate until they studied the cause and incidents of disease, where it occurred, and how it spread. The primary requisite for intelligent administration is a knowledge of the problem, and this can be had only through adequate records.

Crime Commissions.—A significant movement in the past few years, concerning the crime situation generally rather than the police specifically, is the acute realization by the people of this country that the crime situation is serious and that strenuous measures must be taken if any progress is to be made in alleviating the situation. This awakening has resulted in the establishment of crime commissions in Chicago, Baltimore and Cleveland, one in the state of Missouri, and late in 1925 a national crime commission was organized. These organizations are citizen agencies, which make continuous fact-finding studies of the problem and seek by coöperation with public officials concerned and by disseminating information among the public, to bring about more productive methods in the administration of criminal justice.

Prevention.—The police with their "watchmen methods" are effective against offenses that may be classed as preventable—burglary, robbery, ordinance violations, and breaches against the public peace. Homicide and the large category of offenses that are responsible for the bulk of the work of the courts and fill the penal institutions are practically outside the control of the police. The police force must still remain the first line of defense in the direct prevention of crime, with extension and improvement of its present methods, but it should also assume a greater responsibility in the prevention of criminality by closer and better coöperation with the other forces in the community. To do this requires no change in form of organization, but does require a different viewpoint and a change in type of administration. Secondly, emphasis must be placed upon the scientific approach to police organization and administration. Failure to apply this method has been the outstanding weakness in this field and is largely responsible for the shortcomings in the fight against crime. Divorce of police affairs from politics and continuity of administration by qualified police commissioners is the first step and most urgent need. All this requires public support, and the promotion of it is the problem.

State Police.—Due to the changing social conditions in this country, the crime problem is not only one of the cities, but has spread to the suburban and rural sections. Areas are no longer isolated. This has been the gradual result of railways, hastened by the advent of the automobile and good roads. For all practical purposes, boundary lines of cities, counties and states have been wiped out. These changing conditions are being met by state police organizations.

As Bruce Smith puts it: "For the more effective handling of a rural crime problem with which the sheriffs and constables have demonstrated their inability to cope, the legislatures of about one-fifth of the states have placed highly organized forces of trained police officers in the field. In some cases, the chief consideration has been a desire for uniform enforcement of laws relating to commercialized vice, in others at least to some extent it has been the desire to control the disorders attendant upon frequent and serious industrial disturbances, and in still others, the whole problem of rural crime has been a primary factor. But whatever influences may have contributed to the establishment of these instrumentalities of the state, the forces themselves, with only minor exceptions, have quickly turned to the problem of rural crime in its general aspects. They could not have avoided it had they wished. The institution of regular and systematic patrols brought them into immediate contact with conditions which could not be ignored."

Policewomen.—A more intelligent era in the handling of crime and criminals by police departments is indicated by the employment of policewomen. About forty cities now have bureaus of policewomen, with staff ranging from one to thirty-five. Detroit, one of the later large cities to establish such bureau, has a staff of over thirty women, and the head of the bureau, a woman, has the rank of deputy commissioner. The functions of the policewomen are to patrol amusement places, where young men and women congregate, and in coöperation with the other branches of the department, to handle all the women arrested. Policewomen are particularly useful in dealing with young girls, who are in danger of becoming delinquents. As much as possible is done with them without formal arrest and court action, and those that are formally arrested are investigated and interviewed before appearance in court, so that information may be given the judge to enable him to make a more intelligent disposition of these cases. These are much needed socialized methods, which, if applied to the handling of men as well as women offenders, will be a distinct forward step in breaking the vicious circle of arrest and rearrest.

IDENTIFICATIONS

By J. E. Hoover

Chief, Bureau of Investigations, Department of Justice

Personal Identity.—In the daily struggle with the prevailing problem of crime, in the endless battle with a host of criminals, petty and great, timid and desperate, who either undermine the foundations or boldly strike at the basic institutions of the modern state, the question of personal identity is ever present. This is the key to the solution of the innumerable mysteries which confront police officials of every country of the world, the query that faces the Constable of the smallest village or township, the Sheriff of the outlying districts, the Chiefs of Police of our largest cities and the heads of all organizations engaged in the absorbing grapple with the vital insistent demands of practical criminology.

Identification. — A prisoner is brought into "Detective Headquarters" of a modern American city. He may have been taken into custody "on suspicion" to use the current phrase. The drag-net of the police finds its captives in both the marshes of the slums and the seemingly placid pools of the higher orders of society. At once the omnipresent question arises. Who is he? What is his record? Where is he wanted? The reason for his immediate arrest and the punishment to be meted out for the tangible known felony or misdemeanor is in a vast number of instances of comparative unimportance. Fugitives from justice, great and small, are as numerous as the sands of the sea. "Eternal vigilance" on the part of the police "is the price of safety." Somewhere in a distant part of the country or of the world an atrocious crime may have been committed,—a murder, a hold-up or a successful bank robbery, —and here in the guise possibly of a vagrant or a petty thief may be the culprit, long and unsuccessfully sought. Who holds the key? The suspect is not recognized by the local detectives or police. He is a stranger. However, travel in the last few generations has become increasingly simple, and flight from the scene of the crime is the first thought of the criminal. He may be wanted, and badly wanted, anywhere other than the place of his arrest and detention. He is photographed or "mugged," to use the vernacular.

Finger Prints.—He is then fingerprinted, that is to say, the impressions of the tips of each of his ten fingers are recorded on a card provided for this purpose. In practically all of our modern cities and penal institutions this scientific system of identification is now in vogue. This indubitable, ineffaceable, unchanging "finger tip signature" has superseded the Bertillon system of body measurements, the weakness of which lay in the more or less marked element of divergence based upon the personal equation, reliable or otherwise, of many operators. By a combination of numerical values given to certain lines, or ridge formations appearing in various finger prints, a "classification formula" consisting of a fixed numeral-and-letter combination is secured. This becomes the legible "personal identification signature" or mark of the individual under arrest. A similar formula or classification is then sought in the collection, large or small, in the files of the local Identification Bureau. In the majority of instances, of course, no similar record is found. Shall the quest end here? Is this all that can be done? In past years the road of endeavor did end abruptly at this point. It was possible, of course, to telegraph the finger print formula or classification of a suspect to the identification bureaus of several of the larger cities of the country, in the event of any definite pressing suspicion arising, or to such specific localities as the speech, clothing or papers in the possession of the suspect suggested, but that was all.

Central Bureau.—It would appear axiomatic that there existed for years an urgent growing need for the establishment of some central clearing house of criminal information, records and data of this nature, to which the zealous but harassed police chiefs of the country could turn in these daily emergencies, a depository to which each might send the finger-print records of both his suspected and known criminals, securing in turn therefrom the history of the criminals as recorded from all parts of this and other countries, the place or places at which they might be sorely wanted, the penitentiaries from which they may have escaped and the nature of the crimes, petty or capital, which remained unexpiated.

The credit for the establishment of this vitally essential institution is mainly due the International Association of Chiefs of Police, a well known organization comprising in its membership the executive officials of practically every large and important city of the United States and the Dominion of Canada. It was natural that this need should be most acutely felt by these officials who possessed first-hand knowledge of the benefits which would accrue therefrom.

U. S. Division of Identification.—It was primarily because of the initiative and efforts of this organization that, in an act passed by the Congress of the United States covering the general expenses of the Bureau of Investigation of the Department of Justice for the fiscal year ending June 30, 1925, there appeared a special provision authorizing and providing funds for the acquisition, maintenance, and exchange of criminal identification records with the law enforcement officials of the Government and states. This was the genesis of the present National Division of Identification maintained and operated by the Bureau of Investigation of the Department of Justice. Sufficiently commodious quarters for present needs were at once secured in the Hurley Wright Building, 1800 Pennsylvania Avenue, Washington, D. C., and an efficient technical and clerical staff organized and placed in active operation. The Division of Identification started its organic existence with a rich technical endowment. There was bequeathed to it at its inception the extremely valuable and comprehensive finger-print collections possessed at the time by both the International Association of Police Chiefs and the great Federal Penitentiary at Leavenworth, Kansas. In size and character, these collections were invaluable.

Results.—Statistics are, of course, uninteresting and devoid of real significance to all but those technically qualified to judge as to their meaning and comparative value. It is difficult, however, to convey any idea of the remarkable growth and practical efficacy of the Division of Identification without resorting in a minor measure to their use. During the fiscal year ending June 30, 1925 there were received by the Identification Division 104,660 finger print records of criminals, great and small. During the same fiscal year there was accomplished by the Division for the law enforcement officials of the country a total of 38,150 actual identifications or 22.46 per cent. of all prints received, or almost one identification of each four prints received. The full significance and value of these figures may not be readily grasped by the average layman. This means that in response to practically one out of four inquiries, the Division of Identification was able to respond, by telegraph or otherwise, that the individual concerning whom inquiry was made, had a criminal record or was wanted by some police or law enforcement officer or bureau, or that possibly both of the foregoing conditions existed. The value of information of this nature is, of course, clearly apparent. There are now on file in the Division of Identification approximately one million finger print records, that is to say, one million violators of the country's laws,—past, present or potential enemies of society,—are recorded in the archives of the Division in such a manner as to place their identities and records immediately at the disposal of the law-enforcement officers of this or any other country. There are at the present writing one thousand and twenty-nine actual current contributors of criminal information and data who forward their finger-print records and receive, without cost of any kind, the prompt response to all inquiries which the need and exigencies of the work demand. The Division is receiving approximately five hundred finger-print records daily and the daily data received, as well as the number of actual contributors, is steadily increasing.

Significance.—This unique national "Service Institution" is a new element among the forces engaged in combatting the apparently spreading waves of criminality of the present age. Its practical, essential continuing value has been unmistakably demonstrated. Here is nothing theoretical or visionary, nor does there appear any apparent ground for argumentation. There are no personalities involved nor any individual gain or aggrandizement. The law-abiding people of the community receive its full and direct benefits; only the known and recorded criminal is injured by or through its inception and operation. The cost of its maintenance is so small as to be negligible. Its full personnel is forty-eight. To use the trite and hackneyed phrase its work is "only in its infancy." There has perforce been no undignified advertising of its existence, merits or value. It is practically unknown to all except those whose daily labors lie in concomitant and parallel lines, or if and where known, the true nature, value and efficacy of the function it performs in aiding in the detection and prosecution of crimes is but partially realized or understood. Its growth, however, is inevitable and there are practically no limits to the scope of the service it may perform. It is dependent solely upon the continuing support of the practical forces of law and order. This support is, of course, assured, and as the knowledge of the activities of this great governmental clearing house of criminal information data increases, as the leaders of public opinion become more familiar with the significance of this new development in the field of criminology, we may look for a remarkable corresponding increase in the range and influence of its labors and its consequent usefulness to the community at large.

ELECTRIC LIGHTING AND POWER

By Delos F. Wilcox

Public Utility Expert, Grand Rapids

BASIS

Use.—The extent to which electricity has superseded gas for public and private lighting is not exactly known. In many cases the gas used for both lighting and heating passes through the same meter. But it is known that the use of open-flame gas burners has been almost entirely abandoned; that the primary use of gas at the present time is for cooking, heating and industrial purposes; that in many of the smaller communities where electricity is available no gas works exist; that the tendency even in modern residences, stores and offices and other buildings is to rely primarily upon electricity for light, with gas available in some cases for standby or emergency service; that in street lighting the tendency is all away from gas to electricity. It seems strange that this change has not reduced the volume of gas required for domestic uses, but it has not; and gas to-day is still an essential utility with a steady growth in its business. But so far as lighting is concerned, interest and attention are centered at the present time upon developments in the electrical field.

Capital.—Electricity generated at central stations, and transmitted and distributed for general use for light, heat and power, has come to be the greatest of the local public utilities. The total investment in electric plants and systems is not definitely known, but men in the industry claim that it is now more than seven billions of dollars. For the five-year period, 1921 to 1925, inclusive, the investment in additions and extensions is given by the *Electrical World* (Nov. 21, 1925) as $2,473,167,000, accumulated as follows:

1921	$222,318,000
1922	324,016,000
1923	602,143,000
1924	692,440,000
1925	632,350,000

These figures apparently represent gross capital costs, without noting serious diminution by the waste of old capital in the industry, as evidenced by abandonments and accrued; and incomplete as to depreciation. The 1925 investment was divided roughly as follows:

For fuel-burning generating plants	$174,950,000
For hydro-electric generating plants	106,000,000
For transmission systems	130,680,000
For distribution systems	220,720,000
	$632,350,000

The gross earnings of the electric utility are increasing very rapidly. Their yearly total passed the billion-dollar mark not more than three or four years ago, but statistics for the first six months of 1925 indicate a present yearly total of approximately $1,400,000,000.

Water Power and Steam Power.—During this six months period the total amount of power generated was 29,104,105,000 kilowatt hours; of which 23,487,105,000 k.w.h. was accounted for in sales to consumers, leaving for plant use and line losses an amount equal to 19.3 per cent. of the total power generated. Water power was 38.48 per cent. of the total power generated; and steam power was 61.52 per cent. While the movement for the development and utilization of water power went on apace, those best informed as to available sources of hydro-electric power and of the increasing and probable future demand for power think that the future relative importance of water power has been greatly exaggerated in public opinion; and that in all probability the proportion of the total power demand supplied by hydro-electric plants will never be substantially greater than it is now.

COSTS

Corporation Costs.—During the first six months of 1925, the amount of central station electricity consumed for lighting purposes was 27.87 per cent. of the total; for general power uses, 58.81 per cent.; and sold to electric railways, 13.32 per cent. The published statistics for this period do not show the revenues derived from each of these three classes of service, but for the three months, May to July inclusive, this separation is available. The distribution of power consumption is 27.5 per cent., 58.8 per cent. and 13.7 per cent. for the three classes of service respectively, almost the same as for the six months period. The earnings are 69.8 per cent. for lighting; 26.2 per cent. for general power uses, and 4.0 per cent. for power sold to electric railways. Translated into rates per unit of power sold, the averages for the three classes of service are as follows:

For lighting	6.73 cents per k.w.h.
For general power uses	1.18 cents per k.w.h.
For electric railways	0.78 cent per k.w.h.

In other words, the lighting consumers on the average paid nearly nine times as much per unit of electric energy consumed as the electric railways paid, and nearly six times as much as industrial power users paid. This comparison emphasizes a contrast between the rate policies which prevail in some publicly owned systems, where small residential consumers are given the benefit of low rates, and those that prevail with most of the private companies, where comparatively high rates are charged for small consumption; while the big consumers get a very low rate.

On the side of a more nearly uniform rate per unit to all classes of consumers, it is claimed that as a public utility electricity should be made available for as wide a use as possible, something after the manner of the letter service in the Post Office. On the other side it is claimed that the complicated rate schedules which prevail with most of the companies are based on the cost of the different classes of service, and if power uses are favored even on that basis, it is because the development of power consumption tends to spread out the load and increase the efficiency of operation with the result that the average cost of electricity per unit of service is reduced.

Massachusetts Controversy.—In a notable decision handed down by the Department of Public Utilities of the State of Massachusetts in August, the residence "A" rate of the Edison Electric Illuminating Company of Boston was reduced from 9.5 cents to 8.5 cents per kilowatt hour. The department called attention to the fact that the customers paying the residence "A" rate furnished nearly one-half of the company's gross revenues, though using only about one-fifth of the electricity sold; while users of approximately three-fifths of the electricity sold paid prices from 3 cents down to 1.2 cents per kilowatt hour. Commenting upon these facts, the Department said:

"A policy of selling electricity at a rate very close to, if not below, cost, in order to secure the business of those who might otherwise install their own steam power or electric generating plants, and which forces a company frequently to increase its generating capacity and to issue large amounts of securities and capital stock to meet the cost of these enlargements, thereby constantly increasing its investment and its interest and dividend charges, holds little hope to the ordinary user of electricity of securing in the future his electricity at a low cost. Even if this were a wise policy in the long run from the point of view of the company, it ought not to be carried to such lengths that the ordinary member of the public is compelled to carry an undue burden while it is being accomplished."

PENDING DEVELOPMENTS

Muscle Shoals.—The year 1925 was a period of investigation, discussion and progress in the development of electric light and power as a utility. Early in the year Congress had a prolonged and bitter struggle over the disposition to be made of the government plants at Muscle Shoals; but was unable to reach a conclusion in the matter. Hence it was referred to a special commission, appointed by the President, for investigation and report. This commission was unable to agree, and in November it submitted two reports to the President, the details of which were not made public at that time. The Wilson Dam and the steam power plant at Nitrate Plant No. 2, if operated together, will ultimately have a maximum capacity of about 600,000 k.w. The Muscle Shoals controversy hinges upon the questions of government operation, the manufacture of nitrates, and the disposition of surplus power. The first units at the Wilson Dam were put in operation about the middle of the year and the power developed during the testing period was sold to the Alabama Power Company at 2/10 of a cent per kilowatt hour.

Colorado and Hetch-Hetchy Questions.—During the year, the controversy over the disposition of the waters of the Colorado river continued to rage, with the state of Arizona still refusing to sign the interstate compact negotiated two years ago by the seven states tributary to the river. Southern California, and particularly the City of Los Angeles, insist that a high dam be built in Bolder Canyon for the control of flood waters and for the development of electric power and an enlarged water supply for domestic purposes.

The Hetch-Hetchy water supply and power project of the City of San Francisco was advanced sufficiently so that the Moccasin power plant of 70,000 k.w. capacity could be put into operation during the summer. In the absence of municipal facilities for the distribution of power, the city entered into a temporary agreement with the Pacific Gas & Electric Company for the sale of the output of the Hetch-Hetchy plant to the company for $2,000,000 a year. This contract caused a great turmoil in San Francisco and a political overturn favorable to the distribution of Hetch-Hetchy power directly by the city through a municipal distribution system.

Bay of Fundy Proposition.—Throughout the country large steam power and hydro-electric projects were in course of development, and the process of inter-connection of transmission systems and the consolidation of companies went on apace. As preliminary to the development of electric power on a large scale through the harnessing of the tides in the Bay of Fundy by private enterprise, the voters of Maine gave their permission for the exportation of the power which might be developed from this source. The scheme as outlined by the hydraulic engineer interested in this development would involve a capital investment of from $75,000,000 to $100,000,000, and the generation of energy to the amount of not less than 450,000 k.w.

PRIZES

Bonbright Prizes.—Early in the year Bonbright and Company, investment bankers of New York, offered prizes aggregating $10,000 for "the best contemporary review and forecast of the electric light and power industry," to be written in the form of an article dated as of January 1, 1930, summarizing the progress of the decade from 1920 to 1930. The directors of the American Superpower Corporation (of Delaware), sixteen men prominent in the utility field, acted as judges. They also offered an additional prize to be awarded in 1930 to the contestant whose paper, reviewed at that time, should appear to have most nearly approximated the actual development of the facts during the decade.

The first Bonbright prize ($5,000), was awarded to David Cowan, of the Sun Life Assurance Company of Canada, Montreal.

For the aid of the contestants Bonbright & Company issued a *Data Book of Electric Light and Power Facts,* showing at the beginning of 1925 approximately 16,377,600 customers of the electric light and power industry and over 154,000 employees. It was also shown that at the beginning of 1924 less than 43 per cent. of the population of the United States lived in dwellings lighted by electricity and less than two per cent. of the railroad mileage had been electrified. It was also stated that 86 per cent. of the 6,000,000 farms in the country were not provided with electricity.

Mr. Cowan, in his prize-winning paper, forecast an increase of about 65 per cent. in the total amount of power generated from 1924 to 1929, and an increase of nearly 50 per cent. in the number of customers during the same period. He forecast an increase in capital investment from $6,600,000,000 indicated as of January 1, 1925, to $9,700,000,000 in 1929, and he anticipated gross revenues of about $2,000,000,000 in the latter year.

In concluding his paper, Mr. Cowan felt justified in drawing one definite conclusion from the vast developments in the electrical industry during the decade, namely, this: "The existence of excellent power services in all important sections of the country has been the final step in the economic transformation of the rural community. First the railroad, then the automobile and now the advent of cheap electrical power. As a result, life on the farm to-day offers all the special facilities possessed earlier in the decade only by the urban electrified home. By the development, therefore, of super-transmission, by the provision of an efficient and economical electrical service to country districts, leading interests in the light and power industry can feel that they have accomplished something of national significance and their contribution to the prevention of rural depopulation can well stand as a monument to their work."

INTERSTATE

Pennsylvania Giant Power Report.—Perhaps the most important event of the year in the electric light and power field was the publication of the report of the Giant Power Survey Board of Pennsylvania under the chairmanship of Governor Gifford Pinchot. This report was addressed to the Pennsylvania Legislature pursuant to the terms of an act passed by that body in 1923. The survey was made under the direction of Morris L. Cooke of Philadelphia, a well-known consulting engineer.

In his message transmitting the Giant Power report to the Pennsylvania Legislature, Governor Pinchot raised the tremendous political issue of public control over the power monopoly which he sees already in an an advanced stage of development. He pointed out the tremendous significance of the industrial revolution caused by the introduction of steam power, and said that the impending change from steam to electricity will have no less significance. He urged that the great social and industrial conflicts which resulted from the steam revolution be avoided by wise foresight in developing sound public control of electricity as a power agency.

"Giant Power," said he, "is a plan to bring cheaper and better electric service to all those who have it now, and to bring good and cheap electric service to those who are still without it. It is a plan by which most of the drudgery of human life can be taken from the shoulders of men and women who toil, and replaced by the power of electricity.

"To the housewife Giant Power means the comforts not only of electric lighting, but of electric cooking and other aids to housework as well. To the farmer it means not only the safety and convenience of electric light, but electric power for milking, feed-cutting, wood-sawing, and a thousand other tasks on the farm. To the travelling public it means the speed and cleanliness of electric transportation. To the dwellers in industrial cities it means freedom from the smoke nuisance and the ash nuisance. To the consumer it means better service at cheaper rates. To every worker it means a higher standard of living, more leisure, and better pay."

Need of Regulation.—But Giant Power means all these things, in Governor Pinchot's opinion, only on condition that the electric industry is brought under effective public regulation. "No one who studies the electrical developments already achieved and those planned for the immediate future can doubt that a unified electrical monopoly extending into every port of this Nation is inevitable in the very near future," says the Governor. . . . "Producers of electric current commonly sell it to large consumers for a fifth or a tenth of the price they charge to the head of a family, and for much less than the small industrial consumer pays. It is the small user, the average consumer, to whom the companies charge their highest rates.

"Nothing like this gigantic monopoly has ever appeared in the history of the world. Nothing has ever been imagined before that even remotely approaches it in the thoroughgoing, intimate, unceasing control it may exercise over the daily life of every human being within the web of its wires. It is immeasurably the greatest industrial fact of our time. If uncontrolled, it will be a plague without previous example. If effectively controlled in the public interest it can be made incomparably the greatest material blessing in human history."

Effect of Subdivision into States.—In his statement of the problem and in his suggestion of specific measures for the promotion of Giant Power as a public servant, Governor Pinchot challenged the attention of the country and provoked the consideration of many grave issues by the electrical industry and by the consuming public alike. One of the perplexing questions involved is the extent to which the transmission of electricity across state boundaries constitutes interstate commerce which cannot be regulated by the states. Herbert C. Hoover, Secretary of Commerce, has gone on record as strongly opposed to federal regulation, and the specific plans proposed by Governor Pinchot himself are based upon the assumption of state regulation.

In October the administrative board of the American Engineering Council authorized the appointment of a committee to review and analyze the Giant Power report issued by Governor Pinchot, and to report at the earliest practicable moment. Late in the year the governors of New York, Pennsylvania and New Jersey appointed a tri-state committee to study the transmission and control of electric power in these three states with a view to joint action for the control and regulation of their interstate traffic in electricity.

By George W. Fuller
Consulting Engineer, New York

Chicago Problems.—The outstanding achievement in 1925 in this field was the putting in service of large plants for purifying sewage by the activated sludge method at Milwaukee and Indianapolis.

Much discussion was given to the sewage disposal problems at Chicago where the program of the local sanitary district was investigated and reported upon by a Board of twenty-eight engineers. The activated sludge process was adopted for the North Side District and a plant to serve about 800,000 people is now under construction. For the West and South Side plants the trickling filter and two story settling tank has been adopted at areas more isolated than at the North Side.

The situation at Chicago is related to the diversion of water from the Great Lakes through the Drainage Canal, put in service in 1900. The War Department has ruled that Chicago must meter its water supply and build sewage purification works at a stipulated rate, during which process lake water may be used for diversion, although city and industrial plants served by the Canal have greatly overtaxed the capacity of the Canal as originally estimated.

Process.—The so-called oyster scare in the winter of 1924-25 and the agitation concerning unsanitary conditions at bathing beaches has given real impetus to the solving of numerous sewage disposal problems along waterfronts. New York City, Los Angeles, Cal., New Rochelle, N. Y., and some other places have adopted fine screening plants with dispersion of the screened sewage into deep water.

Sedimentation in some cases is more suitable and more efficient than fine screens. The use of sedimentation has been stimulated by developments at Syracuse, N. Y., where the sludge is removed by mechanical appliances and mixed with industrial wastes from the Solvay plant.

A combination of sedimentation tanks with activated sludge process has been studied for many problems in this country, England and Germany.

Utilization of Sewage Gases.—Attention is being again directed to the possibilities of gases from sewage decomposition. Sewage gas was utilized some years ago at Atlanta for heating and cooking, and the gas from the tank at Austin, Tex., is collected and burned to avoid odor and nuisance. The recent experience in Germany, where gases from sludge digestion has been collected and sold for delivery to the city gas mains, has renewed interest in the possibilities of such gas for providing power in connection with the activated sludge process.

Investigations. — The Experiment Station of the State of New Jersey has published additional results of its investigations of Imhoff tanks and sprinkling filters, and expects to extend the scope of its investigations to other forms of treatments during the forthcoming year. These investigations have brought to light much interesting information on the behavior of tanks and filters under various operating conditions and have established some practical rules as well for control of sludge drying and tank foaming.

Additional work has been done at many places on chlorination of sewage. These investigations in general have resulted in the raising of doses formerly regarded as adequate for sewage sterilization. Among other points of interest in connection with chlorination may be mentioned the application of chlorine to the dosing chambers of sprinkling filters with a view of controlling odors and the breeding of the small moth-flies hitherto so troublesome.

"Public health engineering" is the expression adopted by the engineers of the American Public Health Association in lieu of the former expression of "sanitary engineering." Regardless of the name the practical works accomplished have been noteworthy during 1925 and the activities that are underway at various cities along the Great Lakes and the Atlantic seaboard show that there is a true awakening to the responsibility of protecting public waterways from sewage wastes.

REFUSE COLLECTION AND DISPOSAL

By H. Burdett Cleveland

Consulting Sanitary Engineer, New York

Collection of municipal refuse, which includes garbage, ashes, rubbish and street sweepings, is becoming, more and more, a municipal undertaking in American cities as compared to collection by private scavengers or by contract.

A notable tendency during the past few years, emphasized in several instances during 1925, has been the recognition by city governments of the engineering character of the problems involved in both collection and disposal and a realization of the unsoundness of depending entirely on commercial salesmanship as a guide to administrative action.

Of the several methods thus far generally employed, such as dumping, plowing in and trenching, hog feeding, reduction or the extraction of grease and fertilizer, incineration, and the newer Beccari process, it may be said that incineration of garbage mixed with rubbish is becoming the most widely adopted method.

New Methods.—During 1925, Buffalo abandoned its piggery and arranged for the construction of an incinerator. A 280-ton incinerator is being completed for Philadelphia; New York has twelve mixed garbage-and-rubbish incinerators in operation or under construction and six more are authorized, the combined rated capacity of these eighteen incinerators being 2,870 tons daily. The bulk of the garbage produced by New York City is still dumped at sea with consequent frequent fouling of bathing beaches along the New York and New Jersey shores. St. Louis is planning the construction of five additional incinerators beside the one put in operation in 1922, following river dumping, reduction and hog feeding, the two latter methods having been successively used since 1910. Similarly, an incinerator program is being worked out for New Orleans. Minneapolis is building a new 210-ton incinerator at a cost of $204,100.

Comparatively few garbage reduction plants have been installed recently, one of the largest of these being at Schenectady. A ten-year contract at Baltimore for reduction of garbage has been in operation for four years. Incinerators are being built for rubbish disposal at Baltimore. Cincinnati has let a five-year contract for reduction.

Hog-feeding projects are being operated at Akron, Denver, Newark, N. J., and Los Angeles and at several other large cities, and many of the smaller municipalities. This method has been abandoned at several places, notably at Buffalo, owing to the difficulty of disposal without nuisance of the unconsumed garbage, amounting to from 35 per cent. to 50 per cent. of the garbage delivered, and of the droppings.

Italian Plan.—A new method of garbage disposal developed recently is that employed in the Beccari system which originated in Italy. In this process garbage unmixed with rubbish is allowed to ferment and to undergo bacterial reduction in closed concrete cells provided with shelf-like projections around the walls which permit the circulation of air. Odors are absorbed in filter material at the top of each cell and liquid drainage passes through the perforated floor of the cell.

In about ten days after the cell is filled the temperature of the mass of garbage reaches 140° F. and increases to 170° F. in twenty days. In about forty days the bulk of the garbage in the cell has been reduced by 25 per cent. and the residue consists of a dry sterile fertilizer base.

Advantages of this method are control of odors, permitting the construction of plants in locations not requiring long hauls, and conservation of fertilizer elements. Disadvantages are its restriction to garbage only, and in some locations, the difficulty of disposing of the drainage.

A plant of this type has been operated for two years at Scarsdale, N. Y.

The only generalization possible respecting the status and progress of garbage disposal during the year is that incineration has become more definitely the prevailing method in new projects, replacing hog feeding which had been resorted to in many instances during the World War period, replacing at several of the larger cities the more costly and uncertain process of reduction.

DIVISION XI
PUBLIC FINANCE

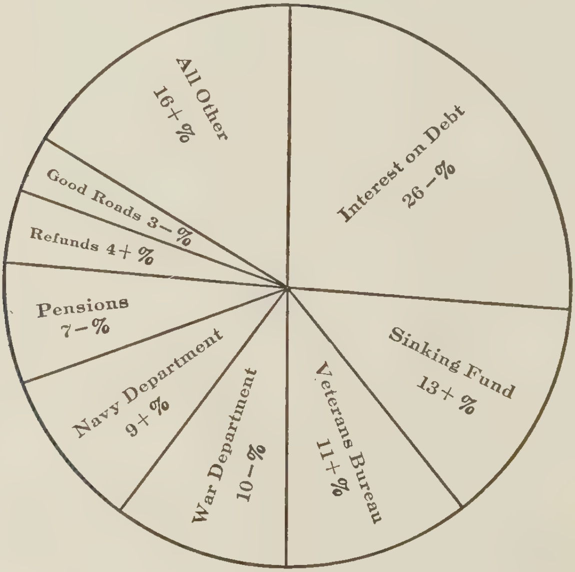
NATIONAL INCOME AND OUTGO

By Merlin H. Hunter
Professor of Economics, University of Illinois

The governmental units of the United States collect in taxes more than $7,500,000,000 a year, an average of about $70 per capita, and spend more than this, for public debts are being created more rapidly than they are being paid. With such a per capita burden as this, and the attendant drain upon the social income of the country, the unprecedented interest in public revenues and expenditures can be readily understood.

The important spending units are the federal government, the state governments, and the municipalities, although such units as counties, townships, school districts, and park and sewer districts help to swell the total. The items for which expenditures are made are much the same in the different political units, although the emphasis upon each is very different. The nature of the expenditures of the federal government are indicated in the following chart. The total expenditures for 1925 were about $3,000,000,000.

Graph No. 1.—Expired Taxes

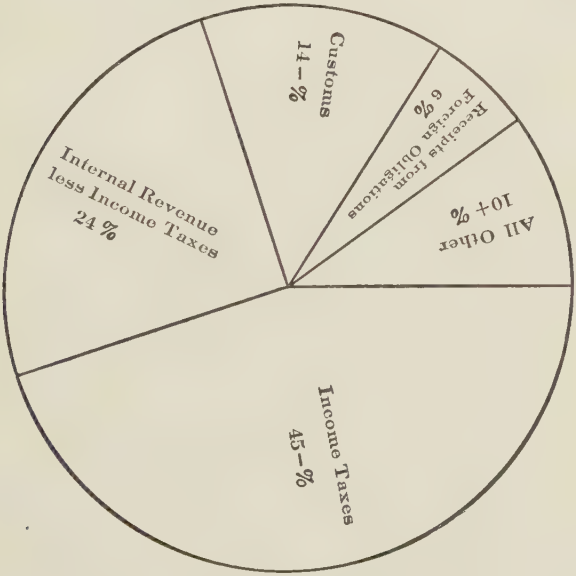


A glance at the chart will show that the expenditures for war, in its preparation, prosecution, and aftermath, easily constitute more than three-fourths of the total. The interest charge alone, the greater part of which arose from war borrowing, represents an item greater than the total expenditures of the government in pre-war years. Since the war, each year has shown a decrease in the total of federal expenditures, yet the year just past showed this to be considerably smaller than for preceding years. Many of these reductions came from the cessation of the activities of the war finance corporation, the shipping board, and the settlement of the claims of the railroads against the government.

The expenditures of a civil nature have shown a steady increase, as have also the ordinary expenditures for the army and navy. The present indications are that, other than for a decrease in the interest charge, little can be expected in the way of lessened federal expenditures, but rather that each year will see an increase. In fact, the expenditures chargeable against ordinary receipts were greater in 1925 than in the previous year. Certainly they will never be near what they were in the years preceding the war.

Federal Revenues.—The large expenditures for the war, only a part of which were met from borrowing, necessitated an expansion in the revenue system. The reduction in expenditures for the post-war years has been accompanied by a readjustment of the revenue system, but it has reached, by no means, the proportions of pre-war years. A glance at the following graph will give some indication as to the present sources of revenue. The total receipts for the fiscal year 1925 were about $3,500,000,000.

GRAPH No. 2.—TAXATION



TAXATION

BY MERLIN H. HUNTER

PROFESSOR AT UNIVERSITY OF ILLINOIS

Rates.—As indicated by the graph, considerable reliance for Federal revenue is placed on the taxation of personal incomes. The law in effect during 1925 was that signed by President Coolidge on June 2, 1924. The normal rates under this law are 2 per cent. on the first $4,000 net income, 4 per cent. on the next $4,000, and 6 per cent. on the remainder. Non-resident alien individuals, unless residents of Canada or Mexico, must pay 6 per cent. on the entire net income. In addition to the normal tax, a surtax is imposed upon net incomes of more than $10,000. These surtax rates begin at 1 per cent. on the amount of net income between $10,000 and $14,000 and increase on successive amounts of income as it increases until a maximum of 40 per cent. applies to all net incomes of more than $500,000.

Returns.—Returns must be made by all unmarried individuals whose net income reaches or exceeds $1,000, and by married individuals whose net income is $2,500 or more. A gross income of $5,000, however, regardless of net income, must be reported. Single individuals have an exemption from the tax of $1,000, while a married person living with wife (or husband) has $2,500. An exemption of $400 is also allowed for each person receiving his chief support from the income recipient. Should the status of a taxpayer change during the taxable year from single to married, then the exemptions provided are to be prorated on a monthly basis and the sum of the two is the actual exemption allowed.

Earned Income. — Recognition is made of the distinction between earned and unearned income. "Earned income" comprises those amounts received from wages, salaries, professional fees, or any other payment for personal services actually rendered. All net income of $5,000 or less is to be considered as earned income. If the net income is more than $5,000, the first $5,000 is considered "earned" but in no case will more than $10,000 be placed in this category. There is never a case, therefore, where more than $5,000 (the difference between the $5,000 always treated as earned and the $10,000 maximum of earned) is subject to a classification in one class or the other. No difference is made in the rates which apply to earned and unearned incomes, but the former are credited with 25 per cent. of the tax assessed against them.

In reality there is no attempt to make distinctions between actually earned incomes and those which arise from other sources. One individual may receive a salary of $20,000 and in addition receive interest from bonds of $3,000, yet the law considers this entirely earned. A university president, on the other hand, may be much more nearly earning $20,000 than is another earning $5,000, yet the law makes no recognition of this. The following table shows the total amount of tax assessed, normal and surtaxes, against net incomes of various amounts. The application is to a married person with no dependents. The maximum earned income is allowed. The last column shows the actual percentage the total tax bears to the net income.

Net Income	Total Tax	Percentage of Tax to Net Income
$ 3,000.....	$ 7.50	.25%
8,000.....	105.00	1.31%
10,000.....	165.00	1.65%
20,000.....	975.00	4.88%
50,000.....	6,095.00	12.19%
76,000.....	13,475.00	17.73%
100,000.....	22,575.00	22.58%
200,000.....	65,575.00	32.79%
500,000.....	199,575.00	39.92%
1,000,000.....	429,575.00	42.96%

Publicity of Income Taxes.—The publicity feature now in operation has caused more adverse criticism than any other part of the law. The provision is that "the Commissioner shall as soon as practicable in each year cause to be prepared and be made available to public inspection in such manner as he may determine, in the office of the collector in each internal revenue district, and in such other places as he may determine, lists containing the name and the post office address of each person making an income tax return in such district, together with the amount of the income tax paid by such person." The objection voiced against this provision is that it gives unwarranted publicity to private affairs which may be decidedly disadvantageous when becoming to the knowledge of business rivals.

It will be noted that it is the amount of tax paid that is made public and not the returns made by the tax payer. The law does provide, however, that the returns upon which the tax has been paid shall constitute public records. They shall be open to inspection, however, only upon the order of the President and under rules and regulations prescribed by the secretary and approved by the President. However, the Committee on Ways and Means of the House, the Committee on Finance of the Senate, or a special committee of the Senate or House, has the right to call on the Secretary of the Treasury for any data of any character contained in the returns. These committees, or agents appointed by them, have the right to inspect the returns at such times and in such manner as they may determine. In addition the proper officer of any state has, upon the request of the governor, access to the return of any corporation.

Sources of Information.—The income tax is, in general, levied upon the basis of the declaration of the income recipient. This is supplemented by information at source under the provision that "all persons . . . making payments to another person of interest, rent, salaries, wages, premiums, annuities, compensation, remunerations, emoluments, or other fixed or determinable gains, profits, and income of $1,000 or more in any taxable year . . . shall enter a true and accurate return to the Commissioner . . . setting forth the amount of such gains, profits, and income, and the name and address of the recipient of such income." Collection at source is used only in the case of incomes, subject to tax, going to individuals without the United States. Under such conditions the payee is required to deduct the 6 per cent. normal tax.

Tax Appeals.—In order to facilitate the adjustment of disputes arising between the government and the tax payer a board of tax appeals has been created. The permanent board is to be composed of seven members although for the first two years the number may be as large as twenty-eight. The members are appointed by the President with the advice and consent of the Senate and those of the permanent board are appointed for a term of ten years. The board as a whole, or divisions of it designated by the chairman, are to hold meetings at places considered desirable, for the purpose of hearing and settling disputes. In proceedings in court to recover any amounts paid in pursuance of a decision of the board, the findings of the board are taken as prima facie evidence of the facts therein stated.

Tax-Exempt Securities. — Much criticism is voiced of the effects of tax-exempt securities upon the success of the income tax. Chief Justice Marshall held that the right to tax is the right to destroy. Consequently the interpretation placed upon the federal constitution that one political division shall not interfere with the prerogatives of any other division has resulted in no political unit levying taxes upon securities issued by another unit. This condition presented no particular problem until the progressive rates were introduced. Securities of political units were generally issued at a lower rate of interest than that carried by other types of bonds and this difference very largely balanced the advantage of tax exemption.

The sur-tax rates of the federal income tax change the situation. Since these cannot be made to apply to the incomes from state and municipal bonds, returns from these become particularly desirable to the recipient of large incomes. If his income be in the higher brackets, a 5 per cent. municipal bond may net him as much as an 8 or 9 per cent. industrial bond. Not only this, but the remainder of the income does not reach to the higher brackets. It is because of this supposed practice that the claim has been made that the rich are escaping their fair share of taxes and that consequently a greater burden is being placed upon those less able to bear it.

Most concern is shown over state and municipal securities since it is the income from these to which the federal surtaxes cannot apply. The amount of these outstanding has been variously estimated above and below $15,000,000,000. It has been pointed out by some, while admitting the fact of a lower rate of interest because of the tax-exempt feature, that the tax collected would amount to more than any saving from the lower interest rate. As a whole, this is doubtless true, but it does not apply to all the political units concerned. Municipalities do not use the income tax, while the states which use it have but low rates; consequently they would feel no particular advantage but a disadvantage in being compelled to borrow at a higher rate of interest. It is doubtless some such consideration that caused the proposed amendment, designed to stop the future issue of such securities, to meet such violent opposition from the Representatives from southern states. The states and municipalities of the South are but entering upon many improvements which have been accomplished in other sections of the country through the issue of tax-exempt bonds. It is felt that a denial of the privilege of tax-exempt bonds would place these localities under an unwarranted hardship in providing public services.

Many claim that the existence of tax-exempt securities and their purchase by the wealthy class are burdening industry by shunting the savings of the rich to this form of investment and forcing the small investor to buy industrial securities. The extent to which this is true is obviously incapable of definite proof. When one considers, however, that the total outstanding issues of past years is approximately $15,000,000,000 and that the annual social income of the United States is more than $70,000,000,000, it seems that the annual issue of tax-exempt securities would not deprive industry of any great proportion of the total investments. One must also remember that the funds borrowed by governments are not usually lost to industry. Funds used to purchase bonds issued to construct a highway, canal, or building will stimulate activity in the industries furnishing material for these enterprises just as much as if the enterprises had been undertaken by individuals.

Estate and Gift Tax.—In emergencies the federal government has often made use of inheritance taxes, but gave them up with the passing of the emergency. It has not given them up, however, after the emergency of the World War, but seems inclined to continue their use as a part of the ordinary fiscal system. The levy at present is not strictly upon inheritances but upon the whole of the estate before any division is made. The annual returns fluctuate around $125,000,000. A deduction of $50,000 is allowed from the net estate before the rates apply. These are progressive from 1 to 40 per cent. The 40 per cent. rate applies to the amount by which the net estate exceeds $10,000,000. This does not mean, as is often thought, that when an estate is more than $10,000,000 that 40 per cent. of the *entire estate* is taken, but only that 40 per cent. is levied on the amount over the $10,000,000. The lower rates apply to the brackets below this amount. Allowance is also made for inheritance taxes that may be levied by the states in the following provision of the law: "The tax imposed by this section shall be credited with the amount of any estate, inheritance, legacy or succession taxes actually paid to any state or territory or the District of Columbia, in respect of any property included in the gross estate. The credit allowed by this subdivision shall not exceed 25 per centum of the tax imposed by this section."

In order to check actual or possible evasion of the estate tax, a gift tax has been put upon the statute books. The rates, exemptions, and other provisions pertaining to gifts are identical with those which apply to estates. Any gift which has been received by the donor within a period of five years is not subject to the tax.

The inclination of the federal government to continue the use of the estate tax has been the target of much adverse criticism. The principal objections have been that the tax is not logically a federal tax since it is under state laws; that the holding and devolution of property is controlled; the revenue from the tax is no longer needed and the source should be reserved for use in future emergencies; the costs of administering estates is increased; a logical source of state revenues is curtailed by this usurpation of the federal government; and that the federal government has entered a field of taxation which has been developed by the states and should rightfully continue to belong to them. The gift tax has been especially criticized because of the impossibility of any satisfactory administration.

Corporation Tax.—A tax of 12½ per cent. is levied upon the net income of all corporations. Many corporations of a benevolent nature are exempt from the tax. An exemption of $2,000 is granted to a domestic corporation with a net income of $25,000 or less. No such exemption is allowed to a corporation with a net income of more than $25,000. When the net income is more than this, however, the tax is not to exceed what would have been payable if the $2,000 were allowed, plus the net income above $25,000. Corporations are also subject to an annual franchise tax paid in advance for the privilege of doing business in a corporate capacity. The rate is $1 for each $1,000 of the average value of the capital stock during the twelve months preceding July 1. An exemption of $5,000 is allowed to domestic corporations which does not apply to the capital stock of foreign corporations.

Stamp Taxes.—A number of stamp taxes continue to be used, chief among which are the following: bonds or certificates of indebtedness issued by any person and all corporate securities with interest coupons or in registered form, five cents on each $100 face value; on original issues of capital stock, five cents on each $100 par value; on sale of stock, two cents on each $100 face value; on conveyances of real estate, fifty cents on each $500 of the sale price; entry of goods at customs house, twenty-five cents to $1.00, depending upon value; sale of merchandise on exchange for future delivery, one cent on each $100; passage tickets sold in the United States to places other than this country, Canada, and Mexico, $1.00 to $5.00; proxies for election of officers or for business meetings of corporations, ten cents.

Tax on Admission to Amusements.—A tax is imposed upon admissions and dues. In general, the tax is 10 per cent. of the admission price, unless it be less than fifty cents, when no tax is charged. A tax of 10 per cent. is also levied upon the dues or membership fees in social or athletic clubs where the annual dues are more than $10. Initiation fees of such clubs are subject to a tax of the same amount if they are more than $10.

Excise and Occupational Taxes.—These taxes are levied upon the different forms of tobacco and an additional one upon tobacco manufacturers. These vary with size, weight, value, and annual sales. Other commodities which are subject to an excise tax are automobiles, tires, tubes, and accessories; cameras; cigar or cigarette holders; coin operated devices; firearms, shells, and cartridges; photographic films and plates; works of art; jewelry selling for more than a defined amount, boats (annual tax graduated according to length of boat). Levies ranging from $50 to $250 are made upon different classes of brokers; shooting galleries, pool halls, riding academies, are subject to a federal tax; while manufacturers and dispensers of liquors and narcotics must pay a license to the federal government.

Estimated Gross Receipts from Taxes.—For the year ending June 30, 1925, there were as follows:

Customs	$555,000,000
Individual income tax	670,000,000
Corporation income tax	850,000,000
Estate tax	100,000,000
Gift tax	1,750,000
Alcoholic spirits	26,000,000
Tobacco and tobacco manufactures	350,000,000
Admissions and dues	50,000,000
Automobiles, trucks, etc	130,000,000
Cameras and lenses	800,000
Photographic films and plates	900,000
Firearms, shells and cartridges	4,500,000
Smokers' articles	100,000
Coin-operated devices	250,000

Art works	$ 500,000
Jewelry, watches and clocks	12,000,000
Corporation capital stock tax	80,000,000
Stamp taxes	47,500,000
Oleomargarine	4,000,000

Possible Changes in Taxation.—As already indicated, there has been much dissatisfaction over parts of the revenue system. The Ways and Means Committee of the House, after a number of hearings have prepared recommendations to be submitted to the next session of Congress. Little opposition has appeared to the proposals and it is very likely that legislation closely in line with the recommendations will be adopted. It is calculated that the tax reduction from the changes will amount to about $300,000,000.

The Committee would raise the income tax exemption for single men from $1,000 to $1,500 and of married men from $2,500 to $3,500, and would decrease the normal rates to 1½ per cent. on the first $4,000 net income; 3 per cent. on the next $4,000; and 5 per cent. on the remainder. The maximum surtax rate is to be 20 per cent. and is to apply on all incomes above $100,000. The earned and unearned income features are to be continued with a 25 per cent. reduction for the former. The maximum for earned incomes is to be raised to $20,000. The giving up of many of the present excise taxes is also recommended since they are generally looked upon as nuisances. The abolishment of the publicity feature of the personal income tax is also recommended as is also the repeal of the gift tax.

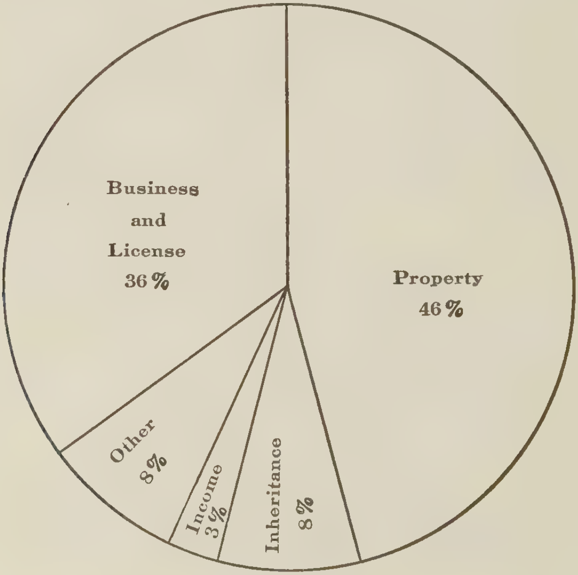
REVENUES OF STATES

By Merlin H. Hunter

Professor at University of Illinois

Distribution of Taxes.—That the states continue to place considerable reliance upon property as a basis for tax levy is indicated by the following graph, which shows the percentage of the revenue which states are deriving from the different tax bases.

Graph No. 3.—State Taxation



General Property Tax.—Little need be said as to the unsatisfactory conditions surrounding the use of the general property tax. These have been pointed out so often and broadcast so widely that they should be a part of the general knowledge. The discouraging aspect is that so little has been done to remedy the situation. In most states there is no semblance of uniformity in the assessment of any kind of property, while the notorious failure to assess personal property still continues. Many state constitutions still have the requirement that all property must be assessed at a just and uniform rate. In some states this requirement has been eliminated by constitutional amendment, in others, such attempts have failed, while in many cases attempts at change are still being made. The last session of the Illinois General Assembly authorized the submission of a constitutional amendment to the voters in November, 1926, which, if adopted, will give broad powers in making tax reform.

Some decided improvements exist in some states where the constitution is liberal enough to permit them. In New York, for example, evidences of secured indebtedness are no longer subject to the property tax but pay a fee upon registration. Very recently the state of Kansas has adopted a similar plan. New York has also ceased to use property taxes for state purposes which eliminates the inequality arising from apportioning a state tax among the smaller jurisdictions. The divorcement of the assessor from local politics and the centralization of authority have also been attended by satisfactory results where they have been introduced.

Business and License Taxes.—A number of items are included under business and license taxes. The most important business tax is that upon corporations, while the licenses include all sorts of payments from the fee for automobile registration to those legalizing numerous sorts of occupations. No accurate generalizations can be made as to the method of taxing corporations, for exactly the same plan is found in no two states. In most cases a fee of varying amounts is exacted for granting a corporate charter, but the real plan of taxation is in addition to this.

One method for taxing corporations which may be found in some form in a number of states is a levy upon the capital stock or upon the capital stock and bonds. In other states net earnings are made the basis of levy, while in some most reliance is placed upon gross earnings. In some an expert assessing body is given power to make a levy upon the value of the corporation as a "going concern" and power is given to them to take into consideration all the factors which will add to the value of the concern or which will subtract from it. None of these plans gives entirely satisfactory results or there would not be such a diversity of use among the states.

Special Corporation Taxes.—Many types of corporations are relieved from taxation under the general law and are subject to a method of taxation applicable only to the particular class. One of the first of these classes was banks because of the necessity of state taxing methods to conform to the requirements of the federal government in the taxation of national banks. The different forms of public service corporations are usually taxed under laws having a specific application to them and in general some form of an earnings or dividend tax is used. Many of these taxes have been justified because of their regulatory aspects but since the inauguration of regulation through the public service commissions this justification has lost the force it may have had. Manufacturing companies are frequently placed in a separate class for purposes of taxation, primarily with the idea of showing leniency in order to encourage development. Insurance companies, also, are not generally taxed under the general corporation tax law.

License Taxes.—A great variety of license taxes may be found among the various states. The purpose is either to secure revenue, to provide regulation, or both. The use of such taxes is much more extensive in the

Southern states than elsewhere, although their use has been increasing rapidly in other states in recent years. Any Southern state might be chosen to illustrate the extensive use made of license taxes upon business and occupations; the following is but a part of the requirements of the state of Georgia.

The annual license in the State of Georgia upon an adjustment bureau is $50 for each adjuster employed; advertising agencies, $50; collecting agency, in each county where branch is located, $200; teachers' agency, in each county where branch is located, $25; auctioneers, $50 to $200, depending on kind of goods sold; garages, $5 to $50, depending on size of city; automobiles operated for hire, $5 to $40, depending on size of city; automobile truck assembling plant, $300; tent maker, $15; billiard tables, each $50; barber school, $15; barber shop, $5 per chair, with a minimum of $10; agent for barber supplies, $50; brokers, $25 to $250, depending on nature of business; restaurants, $5 to $100; cemetery companies, $50.

A percentage of the cost is levied upon contractors and construction companies. Licenses are required of most retailers varying from $5 to $600, depending mostly upon the nature of the business, although the size of the city is sometimes considered; the tax upon laundries is from $25 to $100, depending on size of city; packing houses pay from $25 to $300, depending on population; peddlers, $50 in each county; skating rinks, $25 to $100; undertakers, $10 to $200, depending on population; warehouses, $25 to $200.

In addition to this partial list there is a large list of miscellaneous license requirements. These include a number of forms of amusements. The payment by a circus ranges from $100 to $500 a day, depending upon population; for each grand opera concert in a city of less than 100,000 population, $1,000; in larger cities, $2,500. Moving picture theatres pay from $250 to $1,250 a month.

Taxes on Automobiles and Gasoline.—One form of license payment which developed very rapidly and which is now found in every state is that upon automobiles. There is, however, no semblances of uniformity in making the levy or in the amount exacted. In the forty-eight states, at least seventeen different bases are used in determining the license. In the case of passenger cars, the horsepower basis is the one most frequently used, while for motor trucks it is rated carrying capacity. Other items used in arriving at the amount of the payment are gross weight of vehicle and load, weight of vehicle, cost, piston displacement, flat rate per vehicle, and total tire width. In some states more than one basis is used. In North Dakota, for example, the license charge is based upon four different factors—cost of the vehicle, weight of the unloaded vehicle, its horsepower, and its carrying capacity.

Such a diversity of computing license payments results in very unequal charges in the different states. In the case of a medium priced car the range is from $5 to $35, while for a five-ton truck it is from $5 to $300. There is, of course, no justification for such differences, and agitation has already arisen to secure greater uniformity in the charges levied by the states upon automobiles.

A form of tax the use of which has grown with phenomenal rapidity has been the one upon gasoline. The first use of such a tax was in February, 1919, in the state of Oregon and since that time about four-fifths of the states have adopted some form of a gasoline tax. The rates range from ¼ of 1 cent a gallon to 3 cents a gallon. The rapid growth in motor transportation with the demand for improved roads has been responsible for the adoption of the gasoline tax. It follows the principle that the building and maintenance of highways confer a special benefit upon the motorist for which he should make some direct payment. Since, in practically every case, the amount collected is placed in the highway fund, the gasoline tax appears to be just and equitable. There is a direct relation between the amount of gasoline used and weight of car, mileage, and speed, just as there is a direct relation between these factors and highway depreciation.

State Inheritance Taxes.—While inheritance taxes represent only about 8 per cent. of the tax burdens of the states, no other tax has been responsible for more injustice than has this form of revenue. From humble beginnings in Pennsylvania in 1826 the inheritance tax has grown until the principle is used in forty-five of the states. The tax is not found in Florida, Alabama, or Nevada. In Florida an amendment was recently added to the constitution forbidding the future use of inheritance taxes, while in Nevada the general assembly repealed the law which provided for such a tax. New York, on the other hand, added an estate tax to her already existing inheritance taxes.

The chief difficulty appears in the variety of choice of bases for levy in the different states. Some choose citizenship, others residence, physical location of property, location of securities, etc., until it is possible to have a levy of five or six different taxes upon the same bequest, and not at all uncommon to have two or three. With the increased rates of recent years, this multiple taxation has in many cases been intolerable and has been the target for much adverse criticism. Neither the suggestion that the federal government alone administer the tax and make allocations back to the states, nor that the states adopt uniform methods of taxation with some consideration of justice, has made much headway in accomplishing needed reforms, and state inheritance taxes still form one of the most discriminating and unjust parts of the revenue system of the states.

State Income Taxes.—The increased need for revenue, the failure of the property tax, and the successful use of the income tax by the federal government has caused a more favorable attitude to the income tax by the states. Since Wisconsin adopted the income tax in 1911, state after state has been added to the list until at present some form of income tax is found in the additional states of Delaware, Massachusetts, Mississippi, Missouri, New York, North Carolina, North Dakota, Oklahoma, South Carolina, and Virginia.

One of the hindrances to a more rapid development of state income taxes has been constitutional limitations. In only about one-fourth of the states is an income tax specifically sanctioned, while in a large number of the remainder an amendment to the constitution would be necessary before it could be adopted. This is being considered in some states, has been rejected in others, while the state of Florida recently adopted an amendment forbidding the use of income taxes. In a few states the constitutional provisions are so detailed and restrictive that a serious handicap is placed upon the formulation of a desirable and successful income tax. Because of constantly changing conditions, a constitution should do little more than authorize the use of the tax, and leave the details to be worked out by the members of the general assembly and the administrative officials.

Problems occur in the administration of state income taxes which do not occur in the use of the federal tax. One occurs in the basis upon which to make the levy, because of the possibility of causing unwarranted double taxation. The most logical methods of levy are upon incomes of residents of a state, upon incomes arising within the state, or upon a combination of these. Double taxation would not result in the use of either of the first two, yet the combination of the two is the plan usually adopted. The only reason that greater objection has not been raised is because a larger number of states do not use the tax.

The use of the expression "state income tax" is somewhat misleading in that it implies a method of securing revenue for state purposes. It would often be more accurate to say "state administered income tax" because in some states much of the receipts is distributed to counties and cities. In Wisconsin, for example, only 10 per cent. of the receipts is kept by the state, while in New York 50 per cent. is retained.

Appropriation of Income Taxes.—Many bases for the distribution of the receipts from the income tax have been suggested, and to do this satisfactorily, especially when only a small part is retained for state purposes, is one of the real problems of state income taxes. The bases most used are the amount of revenue received from the local district, the assessed valuation of property therein, or for some special purpose such as maintenance of education. The difficulty with the first is that incomes may arise in a district entirely different from the one from which the tax is paid. Individuals, for example, whose entire income arises from business conducted in Chicago or New York may live and pay income taxes in other cities or counties. Strictly residential districts, therefore, in an allocation on the basis of the amount of taxes received, will receive a relatively large amount. An allocation on the basis of the assessed valuation of real estate is more satisfactory, for real estate is found in most cases both at the place of business and at the place of residence. An evident advantage of this method is the incentive to place an accurate assessment upon property, because underassessment automatically lessens the receipts from the income tax.

Exemptions.—In Wisconsin an exemption of $800 is allowed to a single person and $1,200 to the head of a family and $200 is allowed for each dependent. The rates are progressive from 1 to 6 per cent, the latter rate applying to all incomes of more than $12,000. In New York the exemptions are $1,000 and $2,000, with $200 for each dependent. The rates are 1 per cent. on the first $10,000; 2 per cent. on amounts from $10,000 to $50,000; and 3 per cent. on amounts above $50,000. In South Carolina the rates are one-third those imposed by the federal government while the deductions and exemptions are the same.

Other Revenues. — States have many sources of revenue of minor importance. Reports of poll taxes are found in some twelve states, but other than in Massachusetts the returns are small. In this state a tax of $5 is levied for the purpose of paying a soldiers' bonus. Some receipts come also from fines, forfeits, escheats, subventions, special assessments, and donations but the total is not large. In some cases the returns from interest and rents is large, while the earnings of some of the departments is often not inconsiderable. This explains the fact that expenditures of some states are often much greater than the tax burden.

EXPENDITURES AND INDEBTEDNESS OF STATES

By Merlin H. Hunter
Professor at University of Illinois

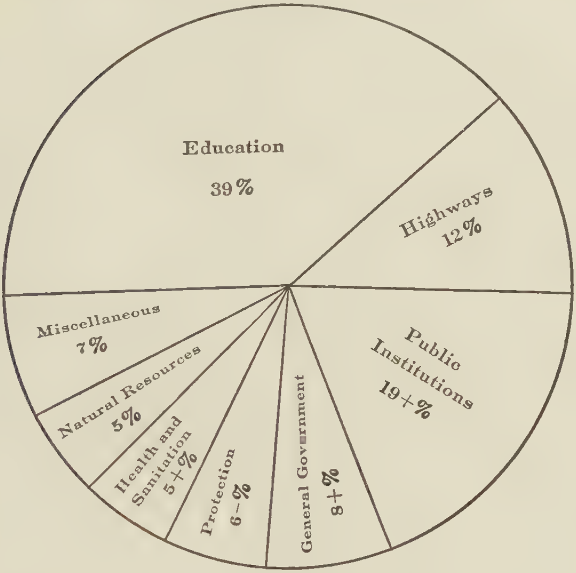
Distribution of Expenditure of States.—The expenditures of the forty-eight states is not a great deal more than $1,000,000,000; and the tax burden somewhat reduced by the earnings of the different departments is less than this. The relative distribution of the total expenditures for the more important items may be noted from glancing at the graph on the following page.

While this graph portrays the approximate distribution of state expenditures as a whole, some variations will occur for individual states. In about one-sixth of the states the item of expenditure first in importance is for the public institutions while in one or two states the expenditure for highways takes precedence.

Comparison of States.—Many interesting variations occur in both the total and per capita expenditures of individual states and in different parts of the United States. In general, the per capita expenditures of the Southern states is low for all the items in comparison to those of the other states. The Mountain and Pacific states show high per capita expenditures.

Some states may show an abnormally high expenditure for a particular item to which they are giving especial interest. This is illustrated by the high expenditures in some states for highways.

GRAPH NO. 4.—STATE OUTLAYS



Objects of State Expenditure.—The items included under expenditures for the general government are those for the legislatures, and the numerous offices under the executive and judicial branches. Under protection is included the expenditures for police, the fire marshal, militia and armories, fish and game warden, and the regulation of financial institutions, insurance companies, public service corporations and different forms of occupations. Under this is also included the many forms of inspection. Expenditures for the development and conservation of natural resources are for agricultural extension, experiment stations, reclamation, forestry, fish and game, and geological surveys. The principal items under health and sanitation are the prevention of communicable diseases, conservation of child life, food inspection, and the regulation of professional occupations.

The public institutions care for the dependents, defectives, and delinquents. Under the first item are placed the poor, the children, and the blind, deaf, and mute. The insane and feebleminded are the most important of the defective classes, while institutions for delinquents are divided into those for adults and those for minors. Expenditures for highways include such items as roads, bridges and waterways, while those for education cover the items of schools and libraries.

The total gross indebtedness of the forty-eight states is approximately $1,500,000,000 or about $13 per capita. Most of this is funded debt and the securities have been issued on the sinking fund basis. A deduction of the accumulated sinking fund assets would leave a net indebtedness of somewhat less than $1,000,000,000.

Following the agitation for reform in the administration of federal finances, nearly every state has made some change in its budgetary or administrative procedure. This has taken the form of centralizing responsibility, either in the governor, the manager of departments which have been created, or in especially selected committees from members of the general assembly. The result has been a marked improvement in the administration of the affairs of the states.

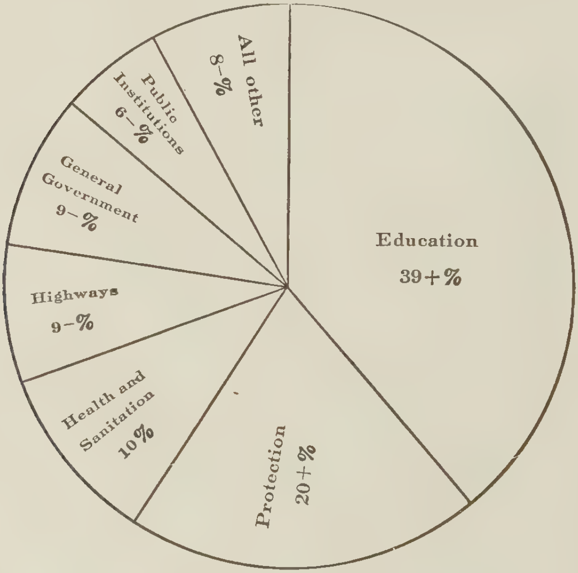
CITY FINANCE

By Merlin H. Hunter
Professor at University of Illinois

Distributive Expenditure.—The expenditures of cities are for much the same items as are those of the states, but the relative importance is somewhat different as a glance at the following graph will indicate. The total, however, is somewhat greater than that for the states, the annual expenditures for cities of more than 30,000 population being over one and a quarter billion dollars. The per capita expenditure is of course much greater than that of the states. The diagram below shows the distribution of municipal expenditures.

The greatest difference in emphasis between state and municipal expenditures is found in protection, health and sanitation, and public institutions. The large expenditures for police and fire departments in cities accounts for the large item for protection. The congested city population necessitates considerable attention to health and sanitation, while the states have assumed the responsibility, to a large extent, of taking care of individuals who must be kept in public institutions. It is interesting to note that in all items of municipal expenditure the per capita cost increases with an increase in population.

Graph No. 5.—City Outlays

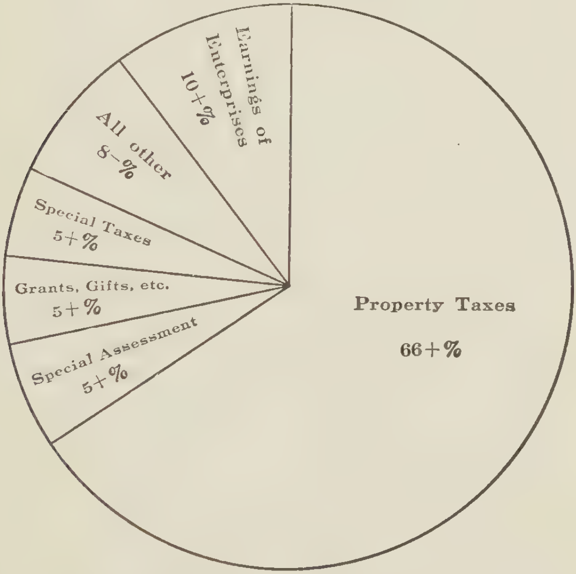


Taxation.—The reliance which cities place upon the taxation of property for revenue is indicated by the graph on page 317.

Many of the evils of the property tax already noted exist here, although in some instances decided improvements in assessment have been accomplished. These have been through the appointed assessor on the basis of merit and through eliminating the personal element to as great an extent as possible through the use of tax maps. The special assessment is especially adapted to cities and is used to finance street paving, lighting projects, and building sidewalks and sewers.

The principal items under special taxes are the amounts received by some cities from the allocated income tax, from the inheritance tax, and business taxes of one kind or another. Other sources of revenue are poll taxes, licenses, fines, donations, rents, interest, and receipts for highway privileges of one kind or another.

GRAPH No. 6.—CITY INCOME



Indebtedness and Administration.—The total indebtedness of all cities having a population of more than 30,000 is somewhat less than $6,000,000,000, a large part of which is funded. Since a large part of this is on the sinking-fund basis, assets have accumulated so that the net indebtedness is about $2,000,000,000 less than the figures for gross indebtedness would indicate.

The growth of municipal indebtedness assumed such alarming proportions that in many states there is a limitation placed upon the borrowing power of municipalities.

Commissioners and Managers.—Many cities have given up the council plan of government and have adopted the city commission or city manager plan. The idea has been to centralize responsibility and in many cases a marked improvement in the administration of the government has been the result. The introduction of a scientific budget and modern accounting practices in the municipality have also made for efficient and economical administration in many cities.

NATIONAL BUDGET SYSTEM

BY FREDERICK A. CLEVELAND
PROFESSOR AT BOSTON UNIVERSITY

Adoption of Budget.—Our National Budget was formally adopted June 10, 1921, after thirty years of educational work. Before 1890 the word "budget" had no place in the language of the American people. It gradually came into use—largely through the combined efforts of the National Municipal League and the New York Bureau of Municipal Research, as applied to local government; through such outstanding public men as Charles Evans Hughes, while Governor of New York, and President Roosevelt in discussion of State and National administration. "The budget idea" was popularized in a series of "drives" against "Invisible Government"—an opprobrious phrase coined by news-writers and finally adopted by Mr. Root and others associated with Mr. Roosevelt in his Cabinet to describe a condition calling for "institutional change" if not for "constitutional revision."

Origin of System.—As a specific device and procedure applied to the management of national affairs, the recently adopted budget system may be said to have had its origin in a series of descriptive and critical reports, and in the constructive proposals of the President's Commission on Economy and Efficiency (1910 to 1913). June 12, 1912, Mr. Taft sent to Congress, with his unqualified approval, a voluminous document dealing with this subject under the title "The Need for a National Budget." This contained not alone a statement of general conclusions but also drafts of forms and recommended procedure. In his special message transmitting to Congress this report Mr. Taft pointed to the specific clauses in the Constitution that gave to him the right to prepare and submit a budget. He recognized, however, that the subject in hand was one calling for a better working adjustment between two coördinate branches of the government—to one of which was given the exercise of executive power, to the other of which was given control over the purse, with the power to hold the executive to account and to decide questions of policy. The budget proposed by him was to be in the nature of an account of stewardship for audit, and a prospectus of future work or a plan of public service to be financed.

President Taft, therefore, urged coöperation. He urged a definite working arrangement adapted to carrying out these constitutional purposes, but the practical situation was this: a working majority in Congress, after the November election (1910), was opposed to the President; most of the executive "patronage" had been disposed of; and another presidential election was in the offing. Reception of Mr. Taft's significant proposal, therefore, was largely a matter of party strategy. And, by the opposition "board of strategy" in Congress Mr. Taft's budget recommendations were ignored.

Mr. Taft, however, did not accept this ominous silence in Congress as meaning defeat. Success, as he saw it, lay in an appeal to the public. His next move, therefore, was to make use of his independent constitutional powers. After waiting about two weeks, an executive order was issued to the heads of departments and offices, requiring them to send to him the information called for in the report according to forms prescribed; heads of bureaus and offices were instructed by the President to do this at the same time that they prepared their estimates as required by law. His "budget" data was to be sent to the White House; the Congressional "estimates" were to be sent to the Treasury on the old forms.

Conflict Between President and Congress.—This action by Mr. Taft was taken as a challenge. Congress was still sitting and continued to sit that year throughout the summer. The Sundry Civil appropriation bill had not yet been passed. This gave to the opposition majority in Congress their opportunity. They responded by inserting in the bill that carried the appropriations for the services at Washington a "rider"—the object of which was to make it unlawful for the heads of a department, bureau or office to comply with the President's demand.

An issue of authority was thus squarely raised; and it was just as squarely met. At the cross-road between the two opposing forces as organized under the Constitution was the Secretary of the Treasury. By

Congress, he, as their ministerial agent was charged with the performance of specific duties. And he was an official subordinate of the President. The Secretary asked the President for instructions. What was he to do about this seeming conflict? President Taft's reply was prompt and vigorous. He said that he saw no reason for doubt or hesitation. In a letter, Secretary McVeagh was told that the "rider" should be ignored—that it was *obiter dictum*—that both Congress and the President were acting within their constitutional right in asking for information. The letter concluded with the following positive instruction to the Secretary of the Treasury: "Print and send without delay to Congress all forms of estimates required by it of officers; also . . . have sent to me the information asked for. . . . This will be made the basis for review, revision and summary statement in the form of a budget with supporting documents which may be sent to Congress by special message as the proposal of the administration." And a copy of the letter was sent to each member of the Cabinet.

Executive Budget.—Delays were brought about, however, so that the President's budget was not ready when Congress convened as had been planned. Congressional Committees met early—before the December session. These committees made large demands on the bureau forces, and in November the election went against the President. Thus, with the prestige of the committees increased, it was made difficult for the executive staff in charge to get in all the returns. An executive budget was completed, however, in January. The summary statements and the President's budget message were made the subject of Cabinet conference and revision—were printed and sent to Congress. The only action of the House was to bury them in a committee. The Senate took no action except to order the budget and message printed and to order the cost of printing charged against the President's appropriation. But this action served a very useful purpose—it got the matter before the public.

The Budget Law.—Wilson came into office. The War followed with its absorbing confusion. But the appeal made to the common sense of the people by the Report on the need for a budget, and the publicity given to the stand taken by the President in reports and messages during the preceding three years, to the opposition of Congress and finally to the budget were so effective that within four years forty-six of the states passed legislation adopting a budget procedure; and in 1919 the two leading national parties were both pledged to a National Budget Law. In 1920, Mr. Harding was elected with a Republican majority in both Houses: and June 10, 1921, the law as it now stands in the statute book was passed.

As has been said: While Mr. Taft asserted his right to prepare and submit a budget, he recognized that the procedure must necessarily be a matter of agreement. He therefore recommended (1) that appropriate legislation be passed, (2) that a budget bureau be created, (3) that the several committees of Congress dealing with appropriations be consolidated. By the enactment of the budget law of June 10, 1921, the first two of these steps were taken; and changes in the rules of Congress followed, consolidating the committees. The law also provided for getting over from the old to new forms and procedure. The first year (1921) two sets of figures were to be prepared: one set was to be made up, as before, of estimates received from the several bureaus and offices without revision; a second set was to be prepared "in such form and amount and according to such system of classification and itemization as is, in his (the President's) opinion, most appropriate." This second or "alternative" form was then adopted by Congress as the form to be followed in years to come.

Bureau of the Budget.—Not alone was the form of the budget one of "executive" determination; but by statute the President was given the staff organization needed for successful operation. This statute set up a "Bureau of the Budget"; and it provided that it should operate "under such rules and regulations as the President may prescribe"—its duty being to "prepare for him (the President) the Budget, . . . make supplementary and deficiency estimates, and . . . have authority to assemble, correlate, revise, reduce or increase the estimates of the several departments and establishments."

As a matter of organization the budget law established three staff divisions, viz: (1) a division of estimates, (2) a division of investigations, (3) a division of law. In aid of the first, the old Bureau of Bookkeeping and Warrants was transferred from the treasury and provision was made for the detail of departmental representatives; in aid of the second, the bureau was given power "when directed by the President," to make a detailed study of the departments and establishments for the purpose of enabling the President to determine what changes should be made in: (1) the existing organization, activities, and methods of business of such departments or establishments, (2) the appropriations therefor, (3) the assignment of particular activities in services, (4) the regrouping of services. To deal with the subject of regrouping services, however, Congress was not content to leave this to the President. The same Congress appointed a joint committee on reorganization in which the executive was to have representation—the net result of which was that by party agreement, leadership was taken over by the President. And it is also to be observed that the United States Bureau of Efficiency (the successor to the Taft Economy and Efficiency Commission) was left intact as a collateral investigating and reporting staff agency and this has been availed of both by the President and Congress.

Along with this statutory provision for reorganization and budget-making went the appointing power of the President. This was important; for, in setting up the Bureau of the Budget, President Harding (without dictation or objection from the Senate), appointed as director a man of national reputation for honesty of purpose and independence; a man of extraordinary executive vigor and of wide business experience—General Charles G. Dawes.

Only a person of extraordinary ability, who had the full backing of the President and the confidence of the country, could have brought about the changes that followed within the next twelve months. What happened was that General Dawes, with his personal vigor, brought to the administration the force needed to impair, if not to break down, the inter-bureau and inter-departmental barriers which had come to stand in the way of coöperation between related services.

President's Control Strengthened.—The power of the President in the exercise of control of the various bureaus, offices and departments under his jurisdiction was strengthened. It was done in ways that were not contemplated in the budget act: (1) by organizing what is known as "The United States Business Organization"—a semi-annual meeting of the several hundred heads of bureaus, offices and divisions in Washington, these being extended also into district meetings in the large cities; and (2) by setting up in the Bureau of the Budget a staff agency that has come to be known as "the Coördinators." In Congress a similar reorganization took place. The many committees in each house having appropriations were consolidated by simply changing the rules. These changes operated to make more effective the powers of "the leader" and the "steering committee." The several "little legislations" were brought more directly under party control as this was developed through the "caucus."

Great questions of "policy" usually have to do with spending money or raising money, or both. Now the leader and his advisor, "the steering committee" may make effective the determinations of what we may well call our "legislative cabinet," by dealing through the chairman of the committee on "Appropriations" and the committee on "Ways and Means." Thus party policy as it may be affected both by legislation and administration has more completely passed out of the President's "Cabinet"; while the President and his Cabinet have been given more complete control over the routine of business that has already been established.

Leadership which has to do with matters of change or adjustment may be said to have more completely passed over to the "legislative cabinet," to the legislative "leader" who may be said to act with the advice and consent of the President—provided the President belongs to the same party. But because of the prestige of the President, he may always be used as a spokesman (and usually is) unless the leadership in Congress may have swung over to the other side.

DEBT OF THE UNITED STATES

By Francis H. Sisson
Vice-President, Guaranty Trust Company

The United States came out of the World War with a public debt which at its peak on August 31, 1919, stood at $25,700,000,000. This represented an increase in indebtedness after our entry into the war of $24,418,000,000, an increase greater than the total expenditures of the United States Government from its foundation in 1791 through the year 1913 — a period which included the extraordinary expenditures occasioned by the War of 1812, the Mexican War, the very expensive Civil War, the Spanish-American War, and the numerous Indian campaigns.

Reduction of Debt.—The United States, however, has been more fortunate than the Allied governments, which, in addition to huge internal debts, have emerged with tremendously increased external obligations. Furthermore, whereas the public debts of many of the Allied countries have been mounting since the armistice, this country has lost no time in reducing the amount of public indebtedness. By June 30, 1924, the public debt had been reduced to $21,251,000,000, a reduction of about $4,500,000,000. Approximately the same rate of reduction was maintained during the fiscal year 1924–25. On June 30, 1925, the gross public debt stood at $20,516,000,000, a reduction of about $5,000,000,000 within a period of six years.

More than 20 per cent. of this reduction has come from a decrease in the general fund balance. This does not represent a reduction in the net debt of the Government. The fact that the Treasury has been able to reduce its cash in bank by over $1,000,000,000 indicates, however, much greater economy of operation. About 33 per cent. of the reduction came from surplus, 28 per cent. from the sinking fund, and the balance from miscellaneous sources including foreign repayments.

In so far as debt retirement was effected by application of the sinking fund, and the principal of foreign repayments, the Treasury merely acted in accordance with the provisions contained in the Victory Liberty Loan Act of March 3, 1919, which created a sinking fund amounting to 2½ per cent. of the Liberty Bonds and Victory Notes outstanding on July 1, 1920, less an amount equal to the par amount of any obligations of foreign governments held by the United States. The practical effect of this sinking fund was to provide for the retirement within about 25 years of approximately one-half of the debt incurred by our own expenditures. The balance of the debt represented by the amounts lent to the Allies was to be taken care of by the repayments made by foreign borrowers. The Treasury is required to apply repayments of principal for this purpose but may use its discretion in regard to interest payments.

The application of the surplus to about 33 per cent. for debt retirement in the last six years represents the vast bulk of the reduction beyond the requirements of the law, and incidentally beyond the requirement of the twenty-five year program for debt retirement. It is true that more than a billion dollars of the surplus applied to debt reduction came not from a surplus of current revenues above current requirements, but from the liquidation of capital assets. This source of revenue, a heritage of the war, is now practically exhausted. Secretary Mellon, however, estimates that the surplus for the current fiscal year will still come close to $290,000,000. He estimates that for the fiscal year ending June, 1927, with revenue based upon the present tax program, the surplus would amount to between $250,000,000 and $300,000,000. He proposes to exhaust this surplus by means of tax reduction, particularly a reduction in the surtax of the income tax and the immediate reduction and ultimate abandonment of the estate taxes.

It has been proposed that our Government should not attempt to retire the national debt entirely at the expense of the taxpayers of the present generation but that retirement should be spread out over a period of 62 years, a figure undoubtedly suggested by the policy of our Debt Funding Commission in regard to the Allies' debts. In order to do this it would be necessary to change the debt-repayment provisions embodied in the Act of Congress, a thing which Congress has the legal authority to do. According to Mr. Mellon, however, "the government bond holder" has what amounts to "a contract morally binding on the United States, since to violate it would be partial repudiation, that the sinking fund will be continued in accordance with its terms, and that repayment of foreign loans will go to decrease the debt which was incurred in their creation." The traditional policy of the United States as well as the dictates of fiscal and economic expediency seems to indicate that the policy of retiring the national debt within a generation of the period in which it was contracted is a sound policy.

THE ALLIES' DEBTS TO THE UNITED STATES

By Francis H. Sisson

Vice-President, Guaranty Trust Company

From the time of our entry into the War until the armistice, the Government of the United States advanced to the Allied governments the sum of $7,078,000,000. Additional loans made after the armistice for relief and reconstruction purposes brought the total up to $9,466,000,000. The foreign debt, with interest accrued and unpaid, amounted to $12,018,000,000 on November 15, 1924. At the present time the aggregate of foreign indebtedness is about $12,085,000,000. Great progress has been made, however, in putting these debts upon a more stable basis. It may be helpful to review briefly events in relation to debt settlement.

Incurment of the Debts.—In his report for 1919, the Secretary of the Treasury stated that all interest which had become due on the obligations of foreign governments held by the United States had with relatively unimportant exceptions been paid. To a large extent, however, these interest payments had been made from the proceeds of loans made by the United States. The loans had been made under exceptional circumstances. The burdens of demobilization and reconstruction and the derangement of the exchanges called for exceptional policy on the part of the creditor country. The Secretary of the Treasury, therefore, announced that the cash payments of interest due during the next two or three years were to be deferred. They have been deferred ever since. At this time also the Treasury informed the treasuries of the European governments to which it had made advances that it was prepared, in case they so desired, to discuss with them the exchange of their demand notes held by the United States for their long-term obligations. Negotiations in regard to the funding of the debts were begun in Washington and continued in Europe during the fall of 1919 and spring of 1920 by Albert Rathbone, then Assistant Secretary of the Treasury. Nothing came of these negotiations. It developed furthermore that decisive action by the United States Treasury was not feasible without further Congressional authority.

Action of Foreign Debt Commission.—The first concrete step toward putting the debts upon a settled status was the appointment of the World War Foreign Debt Commission on April 11, 1922, in conformity with the Act of February 9 of the same year. At its first meeting, held on April 18, 1922, the Debt Commission passed a resolution stating "that the Secretary of State be requested to inform each of the governments whose obligations, arising out of the World War are held by the United States" that the commission desired to receive proposals toward the settlement or refunding of these obligations. In response to this invitation of our Government the governments of the Allied countries, with the exception of Russia, designated representatives to negotiate with our commission.

By November 15, 1924, Great Britain, Finland, and Hungary had funded their demand obligations to this country. Formal debt-funding agreements were reached with Lithuania on September 22, and with Poland on November 14, 1924. These settlements have since been finally approved. In the case of Lithuania the bonds have not yet been exchanged. The funded debt of these five countries amounts to more than 39 per cent. of the total foreign indebtedness. That of Great Britain alone accounts for 37 per cent. The last year has seen the funding of the Belgian and the Czechoslovakian debt, bringing the total of funded indebtedness in excess of 42 per cent. of the total foreign indebtedness.

The settlement with Belgium represents a major achievement, the Belgian debt being by far the largest after that of Great Britain, France, and Italy. The Czechoslovakian debt may be considered one of the minor obligations. The readiness, however, of the smaller countries to fund their debt improves considerably the morale of the situation and bodes well for the future. The vast bulk of the funded indebtedness is represented by Great Britain's debt of $4,554,000,000. The total obligations of foreign governments to the United States at the present time amount to about $12,085,000,000, of which $5,181,000,000 has been funded and $6,904,000,000 remains unfunded, as compared with the $4,794,000,000 funded and $7,269,000,000 unfunded on November 15, 1924.

Adjustment with Great Britain.—The settlement arrived at with Great Britain, for all practical purposes as early as February 3, 1923, was of great significance aside from the magnitude of the debt involved. The precedent set by the largest debtor, with the political and financial prestige that is possessed by Great Britain, effectively put a stop to talk of cancellation and what may be termed abbreviation of the debt, which had already been somewhat allayed by the Congressional mandate to fund the debt implied in the Act creating the Debt Funding Commission. This settlement established the policy of the United States dealing separately with the several debtor governments rather than being involved in a general debt conference with the European nations. One of the implied objectives of such a conference on the part of the debtor countries was undoubtedly an "all around" settlement which would have left the United States collecting its debt via the dubious road of German reparations. It was definitely established that German reparations and the Allies' debts to the United States were things apart. The acceptance of this point of view furthermore took the reparations problem out of the nebulous realm of international politico-financial speculation and made possible the constructive attitude which resulted in the Dawes plan.

Conditions of Settlement.—It was in the settlement of the British debt that the specific principles and terms were elaborated which have been adhered to, by and large, in the subsequent negotiations. All the settlements, with the exception of the Belgian agreement, involve the funding of the principal of the debt plus interest accrued and unpaid at date of settlement computed at 4¼ per cent. A cardinal principle of the funding arrangements is the debtor's ability to pay. In accordance with this criterion the liquidation of the funded debts is extended over a period of 62 years, the amortization payments being very small to begin with and increasing very gradually. In the case of Great Britain the annual installments on account of liquidation range from $23,000,000 in 1923 and 1924 to $175,000,000 annually for the last two installments in 1983 and 1984. The interest on the funded indebtedness outstanding is computed at 3 per cent. for the first 10 years and at 3½ per cent. for the remaining 52 years. The large majority of the demand obligations prior to funding bore an interest rate of 5 per cent. The vast bulk of the war obligations of the United States bear an interest rate of 4½ per cent.

Adjustment with Belgium.—The agreement reached with Belgium on August 18, 1925, differs from the others in that the interest on the principal of $171,000,000 borrowed prior to the armistice was cancelled. Moreover, this sum does not bear any interest during the period of liquidation of the debt. The principal sum of $171,000,000 only is to be repaid in 62 years.

The $175,000,000 borrowed since the armistice was funded in general on the same basis as in the other settlements. Interest accrued and unpaid, computed at 4¼ per cent., brought this sum up to $246,000,000. Because of the economic situation prevailing in Belgium, the fact that trade balances are against her and her exchange situation is unfavorable, it was provided that she should make arbitrary payments over a period of 10 years on the interest and that the 3½ per cent. charge would not apply until the expiration of this period. The total annual payments to be made range from $3,840,000 for the first year to $12,861,500 in 1986.

Adjustment with Czechoslovakia.—The significant aspect of this settlement is, of course, the remission of interest on the pre-armistice or strictly war loans. Although Belgium's difficult fiscal and economic position undoubtedly had a great deal to do with this concession there seems to have been a special reason for this exception, which, the Administration states, should by no means be accepted as a precedent in connection with the other debts. It was agreed at the Peace Conference that in view of Germany's violation of Belgian neutrality, the German Government be substituted as a debtor in respect to the pre-armistice debts. President Wilson made a recommendation to Congress in February, 1921, that a settlement with Belgium be effected on this basis. Congress took no action. Nevertheless, the members of the Debt Commission believed that a moral obligation rested upon this country to abide by President Wilson's promise.

Arrangements for funding the Czechoslovakian debt to the United States were concluded on October 9, 1925. The settlement is on a basis of $115,000,000 to be liquidated over a period of 62 years. The Czechoslovakian Republic was not formed until after the war, and thus all of the advances made by this country come under the classification of post-armistice commercial and reconstruction loans. The interest rate to be paid, therefore, did not involve the matter of possible precedent due to the concession of interest in the Belgian settlement. The main point under consideration was a disagreement as to the actual amount owed to this country. The Treasury books placed the total as of May 15 at $117,679,000, of which $91,979,000 was the principal amount and $25,799,000 accrued interest. There have been frequent exchanges on the subject of the principal of the debt between officials of the two nations ever since 1922. The Czechoslovakians have recognized right along the $80,000,000 reconstruction loan. The accuracy of the $11,000,000 item arising from expenses incurred by the United States in the transportation of Czechoslovak troops from Siberia to their country in 1919 and 1920 has been questioned. In the final settlement on the basis of $15,000,000, this sum was pared down by a little more than $2,500,000.

Negotiations with France.—The principal of the French debt plus interest at 5 per cent., accrued and unpaid, makes the total obligations in excess of $4,210,000,000, as compared with the British debt, which was funded at $4,600,000,000, and at present amounts to $4,554,000,000. The French debt is by far the largest of the unsettled debts, constituting more than 61 per cent. of the unfunded obligations. For this reason the recent negotiations with France are perhaps of greater importance than the settlements achieved during the last year, or, in fact, since the funding of the British debt.

The negotiations carried on in this country during the last week in September, 1925, between our Debt Funding Commission and the French commission, headed by M. Caillaux, did not arrive at an agreement in regard to the permanent settlement of the debt. M. Caillaux carried back with him to France the American proposal for what may be termed a five-year partial moratorium, under the terms of which France would be called upon to pay $40,000,000, representing a rate of 1 per cent. on her debt, annually, for the next five years, these payments to be regarded as the only interest due during this period. This tentative arrangement has since been rejected but the negotiations have not been broken off and a resumption of the debt discussion is expected in the near future.

Interest and Principal.—The recent negotiations will undoubtedly serve as the background, if not the foundation, for future discussion. Such discussion will best be understood in terms of the points of view, principles and emphasis on the facts brought out in the recent conference. The first French offer was to pay $25,000,000 annually for the first five years, $30,000,000 annually for the following ten, and $90,000,000 annually for forty-two years, these payments to extinguish the debt. The American Debt Funding Commission, in accordance with the principles emphatically enunciated in the previous debt settlements, made a sharp distinction between principal and interest and based its proposal on the requirement that the principal was to be repaid in full. The American point of view is that this attitude is absolutely necessary in order to maintain the sanctity of international economic obligations. The Americans agreed, however, to cancel $200,000,000 of past interest so as to bring the total debt down to $4,025,000,000.

Proposals and Counter Proposals.—An attempt was made to formulate the repayment of the principal and the payment of interest in accordance with France's ability to pay. Our Commission proposed that the French should begin by paying $20,000,000 a year on account of principal and increase the sum gradually. As to interest, the American proposal was that the French should pay one-half of 1 per cent. the first year and increase this rate one-fourth of 1 per cent. each year until the thirteenth year. By that time the rate would be brought up to 3½ per cent., which was to be the rate for the remaining years. It will be noted that while not embodying as great concessions as the Belgian debt settlement this proposal was much more lenient than the settlement with Great Britain.

The French commission then advanced a second proposal, under the terms of which France was to pay $40,000,000 annually for the first five years, $60,000,000 for the following seven years, and $100,000,000 for the next 56 years, thus spreading the payments out over 68 years.

Secretary Mellon presented a lucid statement which pointed out why the second French proposal was inadequate. The present value of the annuities contained in the French proposal, capitalized on the basis of 4½ per cent., is only $1,750,000,000 as against an adjusted debt of $4,025,000,000. By way of comparing the French proposal with the tentative Caillaux-Churchill agreement on the Franco-British debt which was presumably satisfactory to France, Secretary Mellon also pointed out that when the French debt to the United States was separated into its categories a settlement with the United States on the same basis would call for much larger payments than the French were offering: namely, $161,000,000 for the first twenty years and $61,000,000 annually thereafter until final payment.

Relations of Reparations.—Aside from the disparity in terms of figures, there was another fundamental issue which militated against an agreement satisfactory to both parties. The ghost of reparation, which it was believed had been finally laid as far as Allied debts were concerned, again appeared on the scene. The French commission at first desired the French payments to the United States to be contingent on reparation payments. Caillaux finally agreed to omit specific mention of German reparations but insisted upon a "safe-guarding" clause which would provide for just such a contingency. The position of our Debt Commission was that a settlement containing such a clause would not be a definite settlement but a contingent one. They pointed out that in case for some reason it should become unfeasible for France to continue making payments, representation could be made to that effect at the time, and that no "safe-guarding" clause was necessary.

In view of the difficult financial situation in which the French Government is involved it may be that our Government will find it necessary to make still greater concessions on the score of interest. The categories of pre-armistice and post-armistice loans may even be invoked to this end. The manner of repayment of principal may be adapted still more to the requirements of the situation. It is doubtful, however, whether this country will accede to the curtailment of the principal of the debt or to a "safe-guarding" clause which either specifically or by implication makes debt payment contingent upon reparation payments by Germany.

Capacity to Pay.—Regardless of the official attitude of the United States on the subject of divorcing the reparations from the Allies' debts,
it must be recognized that the fu
filment of the Dawes plan touch
upon a cardinal principal of our ow
policy, the Allies' capacity to pa
Practically considered, the Germa
reparations are the keystone of t
arch of international indebtednes
The nominal value of the Germa
reparation debt capitalized on t
basis of the British debt settleme
is estimated by the National Indu
trial Conference Board at about $1
500,000,000. France, Italy and Be
gium are designated as the recipien
of 92 per cent. of the reparation pa
ments. It is also well to rememb
that aside from the matter of Ge
man reparations, the Allies' debts
us are part of the general proble
of inter-Allied indebtedness, which
the aggregate amounts to more tha
$23,000,000,000. As a matter of pra
tical policy, however, it seems th
our Government must, for the tim
being, proceed on the assumption th
the Dawes plan will yield reparatio
payments as per schedule and th
the inter-governmental debts in so fa
as they do not directly involve th
country are no concern of our
There is, moreover, implicit faith
our Government's conception of capa
ity to pay on the assumption that t
European countries will impro
their fiscal and economic positio
with sufficient rapidity to enable the
to meet the gradually increasing a
nual payment stipulated in the fun
ing agreements.

Relation of Private Loans.—As fa
as the European countries are co
cerned their immediate need is fo
capital. This country has become th
only source for large amounts
capital in the world. For all pra
tical purposes debt funding has b
come a prerequisite to the negotia
tion of a large loan in this countr
It is very probable that most of th
debtor countries whose obligation
still remain unfunded will find
desirable to forego possible adva
tages in the uncertain future in orde
to meet the demands of immediat
fiscal and economic necessity.

Relation to International Trade.—
The European investments at presen
held by the people of this countr
plus the obligations of European go

ernments held by our Government total in excess of $20,000,000,000. If the debts remaining unfunded should be funded on the basis of the British settlement, an annual interest payment of approximately $1,000,000,000 by Europe to this country would result. This would be curtailed somewhat by foreign holdings of American securities but we should still be in the anomolous position of a great creditor country with a large balance of trade in our favor. Since debts and interest on debts can ultimately be paid only in goods and services it is claimed that if we persist in collecting our debts the export balance must go, either through a decrease of exports or an increase of imports, or both. Although, let us say, $500,000,000 amounts to only about 9 per cent. of our total merchandise exports and about 5 per cent. of our total foreign trade, it is the shifting of our trade as between the commodities that compose our imports and exports that would create the immediate difficulties and conflicts. The fact that the relative change in the trade situation is bound to be a matter of slow readjustment mitigates the economic aspect of the matter considerably. In the meantime, we may for a number of years continue to maintain an excess of exports and still receive interest and debt payments by continued investment in European securities. What we lose as producers we may thus gain as investors. The national income need not dwindle. The readjustment ultimately is between the economic groups in the debtor and creditor countries.

Relation to Currencies and Exchange.—The problem of the actual making of debt payments is considered by many a far more immediate and graver obstacle than the problem of their economic incidence. It so happens that the currencies of France, Italy and Belgium are still in an unstable condition. The budgetary situation, in France particularly, at the close of 1925 is such as to threaten inflation. There are those who are afraid of the vicious circle of debt payment, demand for dollar exchange, depreciation of the currency, aggravation of budgetary difficulties, inflation to cover budgetary deficits, still greater depreciation of the currency and so on: the succession of episodes has been dramatically displayed in Germany. The gravity of the transfer problem, particularly where large amounts are involved and the government has to bid for dollar exchange against industry which is suffering an adverse balance of trade is not to be denied. The master stroke of the Dawes plan was the provision for taking care of the matter of transfers. The reparations are considered paid when they are deposited in the Central Bank of Germany. It is then up to the transfer agent to see that the payments are effected so as to cause a minimum of disturbance to the exchanges. The amounts involved in the respective debt payments are not so large as in the case of German reparations. With the funding of debts will also come an increased investment in European securities. These will serve to create dollar exchange for the debtor countries. In so far, however, as the debt payments and the sale of securities by the debtor countries may not sufficiently coincide it may be found advisable to institute some sort of transfer agency or to regulate the exchanges in some other way.

U. S. Public Debt and Payments on Allies' Debt.—As a result largely of war indebtedness the Federal per capita debt in this country increased from $11.96 in 1916 to $28.57 in 1913, $115.65 in 1918, and $240.09 in 1919. It has since been steadily decreasing, and stood at $188.59 in 1924. Almost one-half of the public debt had its origin in money lent to the Allies. About 57 per cent. of the present national debt is represented by the obligations of the Allied governments.

The Federal per capita tax in this country rose from $6.92 in 1913 to $48.27 in 1919. As a result of our Government's return to a peace-time basis of expenditure, the per capita tax has been declining steadily and was reduced to $29.12 for 1923. The per capita tax is, however, still more than three-fold that of the pre-war period.

A very large share of the tax burden has been due to expenditures in connection with the public debt. The debt service accounted for 29 per cent. of the total ordinary expenditure in 1921, 39 per cent. in 1922, 40 per cent. in 1923 and 41 per cent. in 1924. The bulk of this expenditure has been for interest on the public debt, which will not be directly affected by Mr. Mellon's program of slower debt retirement. Indirectly, this slower retirement will make for a slower reduction in the annual interest charges on the public debt.

The payments we may receive from the Allied countries are obviously intimately connected with the rate of tax reduction in the future. The total funded foreign debt afforded a revenue equal to 5 per cent. of the total Federal tax bill in the fiscal year 1924. If these payments ha been applied to a reduction of th Federal income tax, they would hav permitted a decrease of about 9 pe cent. in the amount raised. If al the foreign obligations were funde on approximately the same basis a the British debt, the United State would receive annually about $450,000,000 in principal and interes which could be applied in part t immediate tax reduction and in a smaller part to a retirement of th public debt, thus permitting a gradua tax reduction later. Although th relief to the American taxpayer woul be only somewhat under $2 per capit annually through a period of 62 year these payments would themselves ad mit of a 20 per cent. reduction i the amount at present raised by th income tax.

THE UNITED STATES BUDGET FOR 1925-26

PREPARED BY DIRECTOR-GENERAL HERBERT M. LORD

for the fiscal year 1925-26, and submitted to Congress by President Coolidge December 7, 1925.

AND

COMPARATIVE SUMMARY OF RECEIPTS AND EXPENDITURES

	Estimated, 1927	Estimated 1926	Actual, 1925	Estimated, 1925	Actual, 1924
Total receipts	$3,824,530,203	$3,880,716,942	$3,780,148,684	$3,601,968,297	$4,012,044,701
Total expenditures	3,494,222,308	3,618,675,186	3,529,643,446	3,534,083,808	3,506,677,715
Surplus	$ 330,307,894	$ 262,041,756	$ 250,505,238	$ 67,884,489	$ 505,366,986

Note—The figures are exclusive of postal revenues and postal expenditures paid from postal revenues and the expenditures include reduction of the public debt required to be made from ordinary receipts.

ESTIMATES OF APPROPRIATIONS FOR 1926-27 COMPARED WITH 1925-26

Estimates of appropriations for the fiscal year ending June 30, 1927, compared with appropriations for fiscal year 1925-26, are as follows, cents omitted:

	Estimates of Appropriations, 1927	Appropriations, 1926	Appropriations, 1925
Legislative establishment	$ 16,498,381	$ 14,915,001	$ 14,279,816
Executive office	441,960	489,960	441,367
Independent offices: Civil Service Commission	1,001,592	1,008,092	1,012,035
Employees' Compensation Commission	2,742,040	2,301,500	2,650,600
Federal Board for Vocational Education	8,210,620	8,227,000	7,324,000
Federal Trade Commission	997,000	1,008,000	1,010,000
General Accounting Office	3,714,400	3,701,960	3,799,852
Housing Corporation	674,398	743,915	882,415
Interstate Commerce Commission	6,033,309	6,853,962	4,641,864
Public Buildings and Public Parks	2,293,850	2,282,505	2,433,115
Tariff Commission	699,000	721,500	683,240
Shipping Board and Emergency Fleet Corporation	14,198,574	24,330,000	30,344,000
Smithsonian Institution and National Museum	858,240	874,020	869,101

DIVISION XII
TAXATION

TAX LEGISLATION

By William E. Hannan
Legislative Reference Librarian, New York State Library

Constitutional Proposals. — While this review of tax legislation is for the year 1925 it must, for proposed constitutional changes, take a backward as well as a forward look. For a period of three years, beginning November, 1924, and ending November, 1927, eighty-eight measures on the subject of taxation and state finance will have been before the voters of thirty-three states. Eighty-one of these measures are constitutional; and seven, initiative or referendum measures, not affecting the constitution.

Constitutional Amendments Passed upon in 1924.—The most important amendments, adopted in 1924, are as follows: California, Florida and Kansas approved a classified tax on certain intangibles. Florida added a new section to its constitution which provides that no tax upon inheritances or upon income of residents or citizens of the state shall be levied by the state. Minnesota authorized a gasoline tax. North Carolina limits the state debt to 7.5 per cent. of the assessed value of the taxable property of the state; and North Dakota increased its bond issue for state purposes from $200,000 to $2,000,000. Wisconsin provides a tax for the development of forests.

Of the amendments defeated, in 1924, the most important are as follows: California disapproved amendments exempting state, municipal, county and public-utility district bonds and federal aviation fields from taxation and one levying a 4 per cent. tax on the gross receipts of motor vehicle common carriers. Minnesota defeated a proposed forestation amendment. Mississippi voted down an amendment providing for a classified property tax and a tax on incomes and inheritances. Wyoming defeated a severance tax on certain minerals.

Certain initiative and referendum measures were also defeated November, 1924. Massachusetts voted down the bill levying a two cent tax on each gallon of gasoline, and Oregon approved the bill repealing the income tax law.

Constitutional Amendments Pending in 1925–1926.—Five states voted on twelve amendments in 1925. Maine adopted two relating to bond issues. New York approved three, two relating to bond issues totaling $400,000,000 for public improvements and elimination of grade crossings, and one concerning the reorganization of the state government. Ohio proposes two amendments: one, a classified tax on intangibles and the exemption of motor vehicles from the uniform rule; the other limits the borrowing power of local government units. Pennsylvania would regulate exemptions in the case of inheritance taxes, and would provide bond issues totaling $38,000,000 for public improvements and forest purposes.

Twenty-eight constitutional amendments will come before the voters of fourteen states for consideration in 1926. The most important of these amendments are as follows: California would levy a tax of 4¼ per cent. on the gross receipts of motor vehicle companies transporting persons and baggage, and a tax of 5 per cent. on companies transporting property by trucks; a second amendment would levy a tax of 5¼ per cent. upon the gross receipts of separately operated steam railroads of a certain length; forestation is to be encouraged by exempting from taxation all immature forest trees on certain lands. Illinois proposes the principle of the classified property tax. Indiana would provide an income tax. Minnesota seeks to encourage forestation. Oregon would follow Florida in its proposal to prohibit the levy of an inheritance and income tax.

Forty-two states held legislative sessions in 1925. The most important changes made in the various tax codes are noted under their proper subject headings.

State Tax Administration.—Connecticut placed emphasis upon the need of centralized control over local tax officials by increasing the powers of the state tax commissioner. Kansas abolished the state tax commission and the inheritance tax commission and created a public service commission of five members with the powers of the former commissions. Michigan, also, abolished the board of state tax commissioners and created a state tax department with the powers and duties of the former commission.

North Carolina consolidated the tax collecting forces. Taxes formerly collected by the secretary of state and the insurance department are transferred to the department of revenue. South Dakota enacted a new civil administrative law. A department of finance is created in which a taxation division is established. The state tax commission, in its present form, is abolished, and a director of taxation appointed. Washington abolished the department of taxation and examination and the state equalization committee, and established a state tax commission of three members with broad centralized powers.

Local Tax Administration.—Kansas created, for certain counties, a board for the approval of plats and maps of land for taxation purposes. Nebraska, for certain counties, authorized the county board to appoint a real estate classification board of three members to classify land outside cities and villages. The county assessor is to base his valuation and assessment upon the classification made by the board. New York provided, in towns over a certain population, for the appointment of one assessor and the creation of a board of review. Ohio abolished the office of township assessor, made the county a unit for taxation purposes, and named the county auditor the assessor.

Income Tax.—Nine states amended their income tax laws. Arizona repealed its gross income tax law. Massachusetts will tax the net income as returned to the federal government and also the business income of a deceased person. New York made a 25 per cent. rebate on the personal income tax. North Carolina made a substantial increase in the income tax rates. South Carolina exempts from income tax all income earned by domestic corporations from property and business owned and operated outside the state. Wisconsin increased the exemption allowed husband, wife, children under 18 years of age and dependents. This state, also, established a formula for apportioning income received by persons engaged in business within and without the state.

Inheritance Tax.—Eighteen states amended their inheritance tax laws. Four states, Connecticut, Massachusetts, New York and Pennsylvania, enacted provisions for reciprocity by which they agree not to tax the personal property of non-resident decedents if a like exemption is made in their favor. Georgia repealed its own inheritance tax law and provided for the collection of such a tax under the federal estate-tax act. Nevada repealed its inheritance tax law. Michigan increased the exemption for lineal descendants, and New Hampshire made a change in the rate of tax.

New York enacted an estate tax law which affects the net estates of resident decedents in excess of $1,000,000. The rates are graduated.

New York, also, in lieu of the progressive rates, laid a flat rate tax of 2 to 3 per cent. on the clear market value of the property of non-resident decedents. North Carolina increased the tax rates on all classes of beneficiaries. Pennsylvania adopted the 25 per cent. federal estate tax provision. Wisconsin provided that the inheritance tax shall not exceed 15 per cent. of the property transferred to any beneficiary. Wyoming made a complete revision of its law. The former progressive rates are changed to a flat rate basis.

Corporations. — Fourteen states amended their corporation tax laws. Nevada formerly based the filing fee on the whole amount of authorized capital stock, the new increased fees are based on the par value of stock authorized. New Mexico requires that the franchise tax be payable on the issued capital stock, formerly the authorized capital stock. Ohio provided for a levy of a franchise tax of 1/12 of 1 per cent. upon the fair value, on an asset basis, of the capital stock of domestic and foreign corporations. Rhode Island changed the flat-rate tax to a graduated rate.

Banks and Insurance Companies.— Eleven states made changes in the taxation of banks. Massachusetts will tax national banks and trust companies on their net income as returned to the federal government, at the same rate as that of other financial corporations. New Hampshire beginning in 1926 will levy an excise tax of 17/24 of 1 per cent. on savings deposits on which interest is paid; in 1931 and annually thereafter the rate will be 12/24 of 1 per cent. Pennsylvania repealed the 10 mills tax on bank stock. South Carolina provided that state and national banks shall be taxed alike.

Eight states effect changes in the taxation of insurance companies. Connecticut reduced the tax on mutual domestic insurance companies from 3½ to 3 per cent. The tax on domestic insurance companies is reduced in two particulars: the state franchise tax is reduced from 5 to 2 mills and the ad valorem stock tax from 10 to 4 mills. North Carolina increased the tax on certain insurance companies from ¼ of 1 per cent. to ¾ of 1 per cent. Wisconsin will tax unauthorized insurance companies on the same basis as authorized insurance companies.

Public Utilities.—Montana will levy a tax of 5 per cent. of the taxable value of the gross earnings of freight line companies. North Carolina provided for a privilege tax of 1 per cent. of the gross revenue of certain public utilities. The privilege tax on the gross earnings of chair and sleeping cars is increased from 3 to 4 per cent. The tax on express, telegraph and telephone companies is increased. Oregon levies an additional tax on all public utilities, based on gross revenue, and at a graduated rate. South Dakota requires express companies to pay a tax of 5 per cent. of the gross earnings, and power companies to be assessed and taxed at the local rates.

Motor Vehicles. — Twenty-seven states made substantial changes in the license fees on motor vehicles. California imposes a fee of 4 per cent. of the gross receipts of motor-vehicle common carriers. Connecticut lays an excise tax of 3 per cent. of the gross receipts of public motor busses. Florida increased the fee on all classes. Idaho requires a fee of 5 per cent., and North Carolina 6 per cent. of the gross earnings of auto transportation companies; there is, also, provided license fees based on age and weight of cars. Indiana reduced all license fees. Iowa bases the auto transportation tax on per ton mile and increases the tax; and Kansas and South Dakota levy an additional tax on like companies.

Massachusetts bases the fee on weight, and Michigan changes from a horse power and weight basis to a weight base alone. Massachusetts' fee is 50 cents and Michigan's 55 and 65 cents per 100 pounds weight. Minnesota levies a tax on the base value of trucks and, on passenger cars, a tax based on weight. Missouri, South Dakota, Oklahoma, Utah and Wyoming increased and Nevada, New Hampshire, Ohio and South Carolina decreased fees. Oregon divides auto transportation companies into six classes, the fee varying. Vermont changes the fees for trucks to a graduated rate based upon weight.

Gasoline Tax.—Every state but four, Illinois, Massachusetts, New Jersey and New York, levies a gasoline tax. Four states levy a tax of 1 cent a gallon; twenty states and the District of Columbia a tax of 2 cents; one state a tax of 2½ cents; eleven states a tax of 3 cents; three states a tax of 3½ cents; four states a tax of 4 cents, and one state, South Carolina, a tax of 5 cents. The trend is toward an increase in the gasoline tax rate. Seventeen states have made an increase in the rate of tax this year.

Assessment. — Nebraska provides for a quadrennial assessment of property, formerly biennial. Ohio requires the county auditor to assess real estate once every six years.

Forestry Tax.—Michigan provides for the establishment of commercial forest reserves and for their administration and taxation. New Hampshire encourages the planting and perpetuation of forests by providing for a rebate in taxes of 50 to 90 per cent. Ohio requires forest land, devoted exclusively to timber growing, to be taxed upon the actual value of the land, the value of the timber to be included.

PROPERTY TAXES

By Jens P. Jensen

Professor at University of Kansas

The Classified Property Tax.—While property taxes continue to yield the bulk of revenue for state and local treasuries, certain changes are taking place in the character of such taxes, of which the most conspicuous is the movement for the classification of property for differential taxation. The November election of 1924 modified the constitutional uniformity rule in Florida, Kansas, and California, so that in these states the legislatures may now classify all or some of the taxable property and tax the several classes differently. At the present time the legislative power to classify exists more or less completely in approximately three-fifths of the states. Though the movement for classification has not been very rapid there is no effective backward tendency, and in the states still subject to the uniformity rule more or less effort is exerted for its modification. Thus Ohio, the stronghold of uniform taxation, again submitted a proposal for classification to popular vote; and a similar proposal will be voted upon in Illinois in 1926.

Until recently the amendments permitted the classification of all property; but Maine (1913), New Mexico (1914), Nebraska (1920), Kansas (1925), and California (1925) have since limited the power to classify chiefly or entirely to intangible property. Under the Florida amendment, which apparently contains no restrictive provisions, no legislation has been enacted.

In Kansas the power to classify is limited to intangibles and "mineral products." The law enacted under the amendment did not extend to the latter type of property, but it established for intangibles the following taxes: for domestic real estate mortgages, a recording tax of 2.5 mills; for other intangibles, an annual property tax of 2.5 mills. Apparently through an oversight on the part of the legislature, manufacturers' and merchants' money and credits were not included, but remain subject to the general property tax rate (119 Kansas 1), the taxation of such money and credits being "otherwise provided for." For the same reason, and as decided in the same case, corporations holding domestic real-estate mortgages on which the recording tax has been paid may deduct the value of such mortgages in determining the value of their property.

In California the amended constitution provides that the legislature may in its discretion provide for a different method of valuation or a different tax on intangibles, provided that the tax on intangibles shall not be greater than the tax on other property; and provided that such a method, once established, cannot be changed except by a two-thirds legislative majority. Under the amendment it was enacted that intangibles generally be assessed at 7 per cent. of the market value and taxed at the local rate, as other property.

Nebraska, which state in 1921, under its 1920 amendment had established a classification similar in form to that of California, found it unsatisfactory and in 1925 established the following classification: money, in bank and elsewhere taxed annually at the rate of 2½ mills; other intangibles, generally, at the rate of 5 mills; bank stock to be assessed at 70 per cent. of the value of personal tangible property and subject to the local rate.

It cannot be said that, administratively, the new classified property taxes have been as effective as their advocates had hoped, that is, the amount of property listed for taxation does not so increase as to yield more revenue at the lower rate. In Kansas it is estimated that the amount of property subjected to the lower rate increased from 300 to 400 per cent. The best that can be claimed for the new law is that under it no owner of intangible property was made to pay confiscatory taxes. Besides, the amount of intangibles reached prior to the new law was so small, and the revenue from it so insignificant that no appreciable loss would have been sustained had intangibles been exempt entirely.

For the mediocre success—as compared with the experiences in Minnesota and elsewhere—several reasons can be given. Kansas has the most decentralized system of assessment in any state. The township trustees are ex officio the local assessors. They did not understand the law, which went into effect only a few days before the assessment day. To make matters worse, the tax commission had just been abolished, leaving no central authority, for the time being, in charge of the administration. To secure effective administration a process of education is necessary, not only of the assessors but also of the taxpayers.

Exemptions.—Pressure for exemptions is always exerted somewhere, and breaks out here and there. At the November election, 1924, Georgia voted to exempt the property of certain industries from all local ad valorem taxes for a period of five years after erection, for the purpose of encouragement. Included are especially the plants erected to manufacture or process cotton, wool, linen, silk, rubber, clay, wood, oil, and metallic or non-metallic mineral; milk or cheese plants; and plants to produce electricity. The exemption is subject to approval of a majority of the voters in the local district proposing the exemption.

Less extensive was the 1923 law of Wyoming which granted similar exemption to beet sugar plants for a period of ten years. It was repealed in 1925, which suggests that such exemptions are often passed by interested minorities in the absence of vigilance of the general body of taxpayers, whose interest must be to prevent the persistent "nibbling away" of the tax base.

New Jersey enacted a law to exempt all personal property stored in public warehouses. The law was passed over the veto of the governor, who in his veto message asserted that the policy of the state ought to be to deny exemptions except to "such property as shall clearly meet the test of giving to the general public an equivalent for the immunity from taxation."

On the other hand, Missouri in the November, 1924, election defeated a proposal to exempt the property of churches and educational and charitable institutions. Evidently the more effective claim for exemption at present is that which offers encouragement to the location and operation of industries.

Central Tax Administration.—What may prove to be significant changes are taking place in the character of the central state agency supervising and administering property taxes, and often other taxes as well. For several decades the evolution appears to have been in the direction of a standard central agency, in the form of a tax commission of, say, three members. In many instances such commissions have rendered signal service to the tax systems of their states. Somewhat later there has appeared the movement for governmental reorganization and a budget system, which in most cases conflicts with our earlier system of independent commissions and boards. How the tax commission and the budget system are to be reconciled is not yet evident, but more or less erratic adjustments are being made.

In South Dakota the tax commission was abolished and its duties assigned to a director of taxation under a secretary of the department of finance. This is a movement toward centralization, with no changes in the duties, however, except that power companies, following a recommendation of the tax commission, are to be centrally assessed by the director of taxation instead of by the local assessor. The object sought is not to interfere with the work of the central agency but to reorganize the form.

In Kansas the tax commission was abolished and its duties assigned to one of the five commissioners of the public service commission. The reason most strongly urged was that of economy in the use of engineers and accountants. A director of the budget was provided for, but no attempt was seriously made to reorganize the financial officers into a centralized department of finance. Whether the change was wise or not is perhaps uncertain, but it was certainly unwise to change the administration at the very moment when a new and hastily enacted intangible tax was to be administered by local assessors.

In the opposite direction was the substitution of a tax commission of three members in the state of Washington for the director of taxation and examination. A bill to abolish the Colorado tax commission and to substitute a "tax agent" failed to pass, and Colorado remains in the anomalous position of having two conflicting and probably irreconcilable fiscal boards, namely a constitutional ex officio board of equalization and a statutory tax commission, in which respect it is joined only by Missouri.

But few changes have taken place affecting the extent of the central tax agency. As mentioned above, in South Dakota the local assessors have been deprived of the task of assessing power companies. In that state also a gross earnings tax, to be administered by the director of taxation has replaced a property tax. Montana likewise adopted at the November election (1924) a gross proceeds tax on mines. The authority of the Montana state board of equalization to assess the property of a wholly intra-county mining company has been upheld against the contention that the constitution vested such power in the county assessor (229 Pac. 730). Also the power to assess omitted property was upheld against a similar contention (in the same case). In general the courts appear to favor the extension of the central assessment and control.

Assessment.—No important legislation has been enacted regarding the methods and principles of the process of assessment. It is necessary to mention merely a few judicial constructions of the proper factors in the valuation for taxation. Thus the assessors of Chicago must consider sales records as evidence of value of land, and cannot employ solely a mechanical or mathematical factor per foot of frontage when the presence of a Chinese settlement had in fact depreciated the value of the property (145 N.E. 600).

The "unit rule," whereby a railroad is valued as a whole and the aggregate value distributed on some basis among the states or local divisions through which it operates, was strengthened by being made applicable to a railroad system, the several parts of which are joined together by a terminal company whose stock is owned jointly by several railroads (264 S.W. 850).

A decision which may be very important to central assessment agencies and corporate taxpayers relates to the jurisdiction of the federal courts in cases of alleged discriminatory assessment. For years the federal courts would not assume jurisdiction. Lately, however, as in Sioux City Bridge Company vs. Dakota County, Nebraska, where intentional and systematic undervaluation was shown, relief has been granted under the Fourteenth Amendment of the U. S. federal Constitution. In denying relief in a case where the Supreme Court found no arbitrary and unconscionable difference between the assessments of the plaintiff and other taxpayers, Chief Justice Taft said: "This court must respect in the fullest degree the sensitiveness of Congress in hedging about the sovereign power of taxation in the states and precluding judicial interference with it, save in clear cases."

Collection.—There is evidence that the problem of collecting delinquent property taxes is receiving consideration although very few definite remedies are applied. Montana, upon recommendation of the state board of equalization, made personal property taxes a prior lien upon all real and personal property of the taxpayer. North Dakota, on the other hand, reduced the penalties on tax delinquency under the general property tax; and also reduced the maximum rate of interest on delinquent taxes from 12 to 9 per cent.

INCOME TAX

By Mabel Newcomer
Professor at Vassar College

Federal Tax.—No legislation has been passed to increase income taxes during the year, but there has been widespread and insistent demand for further reductions in such taxes. The last revision of the Federal Income Tax was the Revenue Act of June 2, 1924. Under this Act the rates of the normal tax are 2 per cent. on the first $4,000 of taxable income, 4 per cent. on the next $4,000 and 6 per cent. on all over $8,000. Surtaxes begin with a rate of 1 per cent. on net income in excess of $10,000, and reach a maximum of 40 per cent. on net income in excess of $500,000. A credit of 25 per cent. of the normal tax is allowed on earned net income under $10,000 and on all net income under $5,000. The personal exemptions are $1,000 for unmarried persons, $2,500 for a husband and wife and $1,500 more for dependents. The corporation income tax rate is 12½ per cent. with a credit of $2,000 for corporations having net incomes under $25,000. The provision of the 1924 Act for publicity of tax returns has aroused much opposition. The right of the newspapers to publish the returns thus made public was contested in the courts, but upheld by unanimous decision of the Supreme Court (U. S. v. Dickey, May 25, 1925).

Income Tax Revenue.—The yield of the federal income tax for the fiscal year 1924-25, the first year to be affected by the changes of the 1924 Revenue Act, was less than the yield for 1923-24. The decrease was in the corporation income tax, however. The personal income tax yield increased in spite of decreased rates. The receipts for the period from July 1 to December 1, 1925, are higher than for the corresponding period in 1924, being $500,000,000 as compared with $456,000,000 for the earlier period.

REVENUE FROM FEDERAL INCOME TAX
(In thousands)

Year	Corporation	Personal	All Income	Per Cent of All Federal Taxes from Income Tax
1924-25	$ 916,234	$845,426	$1,761,659	68.2
1923-24	1,137,797	703,962	1,841,759	65.9

Proposed Changes.—The income tax has continued to be an important political issue during the year. The two principal demands are for (1) a further reduction in the tax rates, especially on personal income, and (2) repeal of the publicity clause. There has been little agitation for taxation of tax exempt securities and there is no indication that Congress will take any action on this point. The recommendations of President Coolidge, Secretary Mellon, and the chairman and members of the Senate Finance and House Ways and Means Committees vary; but all favor reductions in both normal and surtax rates on personal incomes, and a further increase in personal exemptions. The tax bill of the House Ways and Means Committee (which was completed Nov. 23, 1925) provides for personal exemption for married persons of $3,500 and for single persons of $1,500; a normal rate on personal income of 1½ per cent. on the first $4,000 of taxable income, 3 per cent. on the next $4,000 and 5 per cent. on all over $8,000; a reduction of the surtax rates to a maximum of 20 per cent. on net income over $100,000, and an increase in the amount allowed as earned income from $10,000 to $20,000. It also provides for dropping the publicity clause. The estimated reduction in revenues from these changes is $194,000,000, of which more than half wil come from the surtax reductions.

State Income Taxes.—Nine states Massachusetts, Mississippi, Missouri New York, North Carolina, North Dakota, South Carolina, Virginia and Wisconsin, are taxing both personal and corporation net income. Three states, Delaware, New Hampshire and Oklahoma, are taxing personal, but not corporation, income. And two states, Connecticut and Montana, have taxes on corporation, but not on personal, net income.

All of these states excepting Delaware, Massachusetts, New Hampshire and North Dakota tax such income of non-residents as they can reach. New York, North Carolina and South Carolina, however, credit non-residents with the amount of any income tax paid in the state of residence if such state allows similar credits. All of these states but Mississippi and South Carolina tax residents on income derived from sources outside of the state, with only Missouri and North Carolina allowing credits for income taxes paid in other states.

Corporation Income Tax Rates are flat rates of 1 per cent. in Missouri and Montana, with an exemption of $2,500 in the latter state; 2 per cent. in Connecticut; 2½ per cent. in Massachusetts; 3 per cent. in North Carolina and North Dakota; 4⅙ per cent. in South Carolina, with

EXEMPTIONS

State	Personal Exemptions			Rates	Amount of Income to Which Highest Rate Applies
	Married Persons	Single Persons	Dependents		
Delaware	$2,000	$1,000	$200	1-3%	$ 10,000
Massachusetts	2,500 *	2,000	250	1½-6 †	......
Mississippi	2,000	1,000	200	1-5	25,000
Missouri	2,000	1,000	200	1	......
New Hampshire	200	200	...	2.49 ‡	......
New York	2,500	1,000	400	1-3	50,000
North Carolina	2,000	1,000	200	1-3	10,000
North Dakota	2,000	1,000	300	1-6	10,000
Oklahoma	4,000	3,000	200–500	¾-2	25,000
South Carolina	2,500	1,000	400	⅔-15-⅓ §	500,000
Virginia	2,000	1,000	400	1-2	3,000
Wisconsin	1,600	800	300	1-7	12,000

* Exemptions apply to earned income. There is a flat exemption of $300 on unearned income.

† Vary with source of income.

‡ Applies only to income from intangibles. Varies with average of general property tax on all tangible property in the state.

§ One-third of federal income tax rates.

an exemption of $2,000; and 4½ per cent in New York. Virginia has an initial rate of 1 per cent. rising to 2 per cent. on income over $3,000. Mississippi has a graduated rate of 1 to 5 per cent., the maximum being applied at $25,000, and an exemption of $1,000. Wisconsin has rates of 2 per cent. to 7 per cent., the highest rate being applied to all income over $7,000. All of these are taxes on net income, but net income is variously defined, and in some states the tax does not apply to all corporations.

Use of Proceeds.—In Delaware the greater part of the proceeds are credited to the state school fund. In Massachusetts the state retains the temporary additional tax and enough of the regular tax to cover the cost of administration. The remainder is distributed to the local districts. In New Hampshire, also, the proceeds over the cost of administration are turned over to the towns and cities. In New York half of the personal income tax and one-third of the corporation income tax are distributed to the local districts. In Wisconsin the surtax is used for special state expenditures, but only 40 per cent. of the normal tax is kept by the state. In the other states the proceeds are all kept for state purposes.

†† Less than half a million from corporation income.

Legislation and Court Decisions.—The governors of Colorado, Georgia, Iowa and Oregon recommended the adoption of income taxes in their annual messages this year. Both the Illinois and Indiana legislatures passed acts amending the state constitutions to make an income tax possible. Both of these acts are to be submitted to popular vote in November, 1926. No new income-tax laws have been enacted, however, since 1923. On the contrary there has been some reaction against such taxes. In November, 1924, Florida amended the state constitution to prohibit the levying of a tax on net personal incomes, Michigan rejected an amendment to tax incomes above $4,000 at rates of 4 per cent. to 10 per cent., and Oregon repealed the state income tax of 1923. In the last state a proposed amendment to prohibit state income taxes until the year 1940 will be submitted to popular vote in November, 1926.

Amendments to existing income tax laws were made in several states in 1925. In both Delaware and North Dakota minor amendments were made to facilitate administration. In New York a flat 25 per cent. reduction was made in the personal income tax paid in 1925. The Wisconsin legislature amended the law to increase exemptions for married persons from \$1,200 to \$1,600, and for dependents from \$200 to \$300; and to change the distribution of yield, increasing the state's share from 10 per cent. to 40 per cent., decreasing the county's share from 20 per cent. to 10 per cent. and decreasing the share of other local districts from 70 per cent. to 50 per cent.

The Arkansas tax of 1923 was declared unconstitutional by a decision of the Arkansas Supreme Court on January 19, 1925, as in the nature of an occupation tax rather than a privilege tax. This tax was one of 1/10 per cent. on gross personal income. In a later decision, May 4, the same court declared that a tax on net income would be considered as an excise and as such constitutional. The Mississippi income tax was upheld by the State Supreme Court in June, 1925, thereby reversing a decision of a lower court.

CORPORATION TAXES

BY JENS P. JENSEN
PROFESSOR AT UNIVERSITY OF KANSAS

Nature of Taxes.—Interest in corporation taxation manifests itself chiefly in the adjustment of franchise taxes. Corporate property is generally taxed in the same manner as other property under the general property tax, with the exception that property of corporations is often assessed by different methods. But in these specialized methods of corporate property taxation only minor changes are taking place. This may be shown by the fact that the substitution in South Dakota of a 5 per cent. gross earnings tax on express companies is probably the most elaborate change made during the year, in respect to the form of corporate property taxation. Likewise, the extension of the jurisdiction of the central state assessment body in South Dakota to include power companies is probably the most sweeping change in the method of assessment. Of a similar character, to mention only one more change, is the application, in the state of New York, of a 1 per cent. franchise tax on gross premiums to life and casualty insurance companies doing business on the assessment plan, whereby this class of business is placed on the same basis as insurance companies generally.

Taxation Powers.—Judicial constriction by the federal courts of the commerce clause in the Constitution and of the Fourteenth Amendment is slowly narrowing the power of the states to tax corporate franchises. Recent decisions of the Supreme Court particularly place the franchise tax on corporations doing solely an interstate business on an unsatisfactory basis; but they also affect the taxes on corporations engaged partly in interstate and those engaged solely in intrastate business. It cannot be said that the state courts are tending to remedy the conditions very fast.

Most significant is the decision in Alpha Portland Cement Co. v. Massachusetts, decided by the United States Supreme Court, May 4, 1925. That state imposed on a corporation doing solely an interstate business, an excise tax measured partly by the corporate excess situated in and partly by the income allocated to Massachusetts. All corporations doing business in the state were similarly taxed, no discrimination existing against interstate business. Yet it was held that such a tax was invalid on a corporation engaged solely in interstate commerce, the tax being a direct burden on interstate commerce which is invalid under the commerce clause. Had the corporation been engaged to any extent in intrastate commerce, the tax would presumably have been held valid unless shown, in fact, to burden interstate commerce.

In another case, Ozark Pipe Line Corporation v. Monier et al., decided by the same court, January 12, 1925, Missouri attempted to impose upon a corporation transporting oil from Oklahoma through Missouri into Illinois a franchise tax of one-tenth of 1 per cent. of the par value of that part of the corporation's shares which was represented by the property situated in Missouri. Though there was no discrimination, the tax was held invalid as being a direct burden on interstate commerce.

In both cases Justice Brandeis dissented. He saw no bar in the commerce clause to such taxes, which were intended to place the corporations in the same position with respect to their interstate business as with respect to the rest of their business. The presence or absence of intrastate or local business in any amount seemed to him to be a very irrational test of whether or not a corporation should be subject to a state corporate franchise tax. To people generally, the contention of Justice Brandeis is sound. Apparently the states face the necessity for a choice between abandoning corporate franchise taxes entirely, on the one hand, and discriminating in favor of corporations engaged solely in interstate commerce, on the other. What their choice will be is not indicated. At present there appears to be no third possibility.

Basis of Taxation.—A different, less difficult and less important question, whether the franchise tax can be based upon the *authorized* rather than the *issued* stock, has been decided negatively in the case of Air-Way Electric Appliance Corporation v. Day, decided by the Supreme Court, October 12, 1924. Ohio required a tax of three-twentieths of 1 per cent. of the fair value of the authorized stock to the extent that such stock was represented by property owned and by business done in the state. The court held that authorized stock had no necessary relation to the property or the business of the corporation whether interstate or intrastate, and could therefore not be used in computing the tax. This distinction does not appear to embody any very important principle, so long as the value and not the number of the shares authorized is used. Presumably the aggregate *value* of the *issued* and the *authorized* shares would be practically identical. In the Ohio case, however, the tax was a lump sum, five cents, per share. But the opinion indicates that *authorized* stock would not be allowed as the tax base, even though according to its value.

The Ohio legislature accordingly in 1925 substituted, as the tax base, the fair value of such proportion of the *issued* stock as is represented by property owned and by business done in the state. Similar adjustments were made by the legislatures of Utah and New Mexico. Montana, however, retained *authorized* stock as its tax base; and this law will probably be contested.

A still different question is presented where shares of stock of the corporations have no par value. In the Ohio case above the tax was fixed arbitrarily at five cents per share of no-par stock, while in case of other kinds of stock the value of the stock was to be the basis for a tax of three-twentieths of 1 per cent. The Supreme Court held that, while corporations might be classified and the different classes subjected to different taxes and methods, the classification employed had no relation to the purpose for which it was made; it would not tend to produce equality and was repugnant to both the commerce clause and the Fourteenth Amendment. An Illinois Supreme Court decision (144 N.E. 818), reversing a former decision (137 W. E. 202), upheld a tax based upon no-par shares arbitrarily valued at one hundred dollars each.

Except possibly where federal jurisdiction is involved, the status of no-par stock, as a tax base, is unsettled and constitutes a vexing problem, the presence of which reflects but little glory upon the lawmakers and the courts. The accepted magic of a par value for ordinary stock, no matter how fictitious that value may be, has done much harm, and neither the legislatures nor the courts have shown much sagacity in adapting no-par stock as a basis for taxation. In either case, fair value is the most rational basis, and it ought to be obtainable with practically equal facility in both cases.

Liability of Shareholders.—Still another problem remains largely unsolved, namely, the question of when shares of stock shall be taxable to the holders as property when the corporation has paid taxes on all or a part of its property. State laws and court decisions differ too widely on that point. While generally shares of domestic corporations are exempt, this is not generally so with shares of foreign corporations unless the corporation has paid taxes on a part of its property, which part varies widely from state to state. In an Oklahoma case (Board of County Commissioners Oklahoma County v. Ryan, Oklahoma Supreme Court), December 2, 1924, such exemption was accorded to shares of a corporation which had only 5 per cent. of its property taxable in the states. It would be desirable to have greater uniformity among the states in this respect.

INHERITANCE TAXES

BY ALZADA COMSTOCK

PROFESSOR AT MOUNT HOLYOKE COLLEGE

Federal.—The federal estate tax in force in 1925 was levied under the Revenue Act of 1924, which imposed the highest rates ever attempted in the United States, namely, a graduated series rising to 40 per cent. for that portion of net estates above $10,000,000. The maximum rate under the law of 1916 was 10 per cent. and under the laws of 1917 and 1918, 25 per cent. Under the Revenue Act of 1924 a credit was allowed for any state inheritance taxes which an estate might have paid, up to 25 per cent. of the total federal estate tax. By the terms of the same act the estate tax was supplemented by a gift tax applied to gifts between living persons to the extent that the total of the taxable gifts exceeded $50,000, the figure which also represented the exemption for estates.

Since the tax was imposed in 1916 the revenue which it has yielded has been as follows:

1917	$ 6,000,000
1918	47,000,000
1919	82,000,000
1920	104,000,000
1921	154,000,000
1922	139,000,000
1923	127,000,000
1924	103,000,000
1925	109,000,000

The figures show that the revenue was largest when the maximum rate was 25 per cent., instead of the 40 per cent. in force in 1925, and that the yield of the tax has decreased since 1921.

State Taxation.—The federal and state taxation of inheritances overlaps to some extent, although the federal law differs from most of the state laws in that it applies to the net estate, rather than to the distributive shares. In 1925, 46 states had estate or inheritance tax laws. In many of the states the revenue from taxation in this form was small, but in Rhode Island, Massachusetts, Pennsylvania, Connecticut, New York, California, and New Jersey it amounted to at least 10 per cent. of the total state revenue.

None of the states had rates which were as high as those of the federal government, but it was found that when the two rates were added it was possible for them under certain conditions to absorb almost all of a large estate. Added to this difficulty, there was the fact that the varying policies of the states offered an inducement to wealthy property-holders to establish their residences and invest their capital where taxation of this type would be lowest. Full recognition was given to this natural impulse when Florida, by a constitutional amendment adopted in 1924, provided that the state should never impose a tax on inheritances.

In the course of the year the opposition to the estate tax in general, and in particular to the high schedule of rates of the Revenue Act of 1924, gathered force and was formally expressed by several organizations of national importance. The National Tax Association called a conference on inheritance and estate taxation at Washington, D. C., on February 19 and 20, at which President Coolidge spoke. The President mentioned the fact that historically the Federal Government had entered the field of inheritance taxation only on the occasion of war emergency, and that in every case except the present it had withdrawn when the reason for exceptional taxation ceased. He also said that the view, recently expressed at meetings of the National Tax Association and at a conference of tax commissioners, that the Federal Government should withdraw from the field of estate taxation, had much to commend it.

The Conference adopted resolutions to the effect that the "present ill-balanced and illogical state and federal death-tax structure" should be so changed that a "rational tax system" should result, and to that end provided for the appointment of a committee of nine to study the subject and to formulate plans for improvement.

Bankers' Proposition.—In September, 1925, a Special Committee of the Trust Company Division of the American Bankers Association presented a report in which the abolition of the federal estate tax was recommended. The arguments against the tax were given in effect as follows: *first*, the tax is based on the right of succession and is therefore one which may logically be employed by the states but not by the federal government; *second*, the federal estate tax should be reserved for emergencies only, as in 1797-1802, 1862-1870, and 1898-1902; *third*, the federal estate tax is no longer needed as a source of revenue, as recent budget surpluses show; *fourth*, the abolition of the federal estate tax would increase inheritance-tax revenue in the states; and, *fifth*, the administrative burden on estates is heavier in the case of the federal estate tax than in the case of the state inheritance taxes.

Ways and Means Committee.—The committee of the House of Representatives began its work upon the tax bill in October. A number of state governors appeared before it, asking that the Federal Government should retire from the inheritance tax field and leave that source of revenue to the states. In case neither immediate repeal nor gradual abolition should prove practicable, they favored substituting full credit for inheritance taxes paid to the states for the 25 per cent. credit allowed under the Revenue Act of 1924.

National Tax Association Proposal.—In the course of the hearings the Ways and Means Committee received the report of the committee appointed as a result of the conference called by the National Tax Association in February. The report was presented by the chairman of the committee, Frederick A. Delano, and was subsequently known as the "Delano Report." The ten recommendations made were as follows:

1. Inheritance taxes should be substantially uniform throughout the United States.
2. Inheritance tax laws and rates should be stable.
3. Inheritance taxes should be moderate.
4. Legislation should be enacted during the next session of Congress providing for repeal of the Federal estate tax, to take effect six years from the date of the passage of the repealing act.
5. The rate structure of the present Federal estate tax should be immediately revised downward.
6. The credit provision of the present law should be extended to allow a credit of all inheritance taxes paid to the several States up to 80 per cent. of the Federal tax.
7. The gift tax should be abolished.
8. Substitution by the States of estate-tax laws for the succession-tax laws now generally employed by the states is desirable.
9. Multiple taxation of the same property by States should be abandoned.
10. Intangible property should be taxed only by the State of domicile of the decedent.

Secretary Mellon also recommended to the Ways and Means Committee the repeal of the federal estate tax. The reasons given were those frequently stated, including the argument that the right of succession is controlled by the states, the need of the states for revenue, the declining revenue from the federal tax, and the confused situation produced by the combination of federal and state taxes. At the same time the Secretary advocated the repeal of the gift tax.

Bill of Ways and Means Committee.—Contrary to the expectations of many, the repeal of the estate tax was not embodied in the bill which the Ways and Means Committee prepared for the opening of Congress in December. A majority of the Committee was evidently unconvinced that the states would enact uniform inheritance tax laws if the Federal Government left the field to them. In particular, it was argued that Florida, Alabama, and the District of Columbia, which offered opportunities for the rich to escape heavy taxation of estates, would be unlikely to agree with the northeastern states upon a uniform tax.

Instead of repealing the law, the Commitee reduced the maximum rate from 40 per cent. to 20 per cent. and removed the gift tax, but retained the $50,000 exemption, the former rates for the first and second brackets, and the 25 per cent. credit for taxes paid to the states.

Summary.—In spite of the general pessimism about the possibility of inducing the states to enact uniform inheritance tax laws, it was possible before the end of 1925 to record progress. At the 1925 sessions of the legislatures of Pennsylvania, New York, Connecticut, and Massachusetts, laws were passed providing, in effect, that no one of the states will tax the personal property of decedents who resided in one of the other three states, provided that such other state does not tax the property of the resident decedents of the first.

Other conflicts and abuses persisted, however. Most of the states attempted to tax all the property left by one of their own citizens no matter where the property was located. Furthermore, most of them tried to tax all of the property owned within their jurisdiction by non-resident decedents.

That part of a decedent's property which consisted of corporate securities was liable to various kinds of additional taxation. As a result, confusion, delay, and exorbitant tax and legal costs burdened large estates in several of the states. It was apparent at the close of the year that the inheritance-tax situation was still extremely unsatisfactory and that further consideration must be given to the existing conflicts.

BANK TAXATION

By Jens P. Jensen

Professor at University of Kansas

Pennsylvania Dual System.—Until 1925 Pennsylvania has permitted either of two methods of taxing bank stock. One was a uniform tax of 4 mills on the dollar of the value of the stock of both national and state banks. The taxable value included the capital, surplus, and individual profits. This tax remains substantially unaltered. The second alternative, which is now abolished (House Bill 539), was a tax of 10 mills on the dollar of the par value of the stock. In general, the banks would select whichever tax would require the smaller payment. It is expected that the abolition of the optional feature will increase the revenue to the extent of $800,000 annually. Aside from the loss of revenue which the optional par-value tax occasioned, it was illogical and inequitable. There is no necessary relation between the par value of the stock of a bank and its ability to pay taxes.

Court Decisions.—Elsewhere there have been but minor legislative changes in the taxation of banks. Attention has been generally absorbed in the readjustment of state and local taxes on banks to the federal law (section 5219 of the Revised Statutes, as amended 1923). Prior to the Richmond decision (256 U. S. 619) in 1921, section 5219 was regarded as requiring merely that shares of national banks be taxed at least no more heavily than other competing capital; and such capital was regarded as consisting solely of commercial state-bank stock. The Richmond decision held this interpretation too narrow, and extended the term competing capital to include several types of credits which had, in several states, been subject to low-rate mill taxes of the classified property tax.

No serious consequences flowed from this judicial reconstruction in the states where the uniformity rule applied to the taxation of banks as well as property in general. But in states where the credits coming within the new judicial construction had been taxed at the low-rate mill taxes or had been subject to state income taxes only two alternatives appeared possible. One was to return to the uniform rate for all property within the Richmond decision, namely, bank stock and competing capital, as was accorded to property in general. The other was to accord to bank stock as low a rate as was accorded to any competing credits. Neither alternative seemed satisfactory.

Basis under Act of 1923.—The 1923 amendment did not help matters a great deal. It permitted any one of three optional, but mutually exclusive methods.

(1) The shares might be taxed as property to the shareholders as before, save that the term "competing moneyed capital" was defined not to include "bonds, notes, or other evidence of indebtedness in the hands of individual citizens not engaged in the banking or investment business and representing merely personal investments not made in competition" with the business of national banks. The rate, as before, could not exceed that upon competing credits.

(2) The second method permitted was to include the income from dividends with the taxpayer's other income subject to a state income tax. Of this method no state has yet availed itself; and it is probably not practical, because of frequent diversity of citizenship, and for other administrative reasons.

(3) A third method was to tax the income of the bank to the bank. The rate can "not be higher than the rate assessed upon other financial corporations nor higher than the highest of the rates assessed by the taxing state upon the net income of mercantile, manufacturing, and business corporations doing business within its limits." Only one state, Massachusetts, has accepted this alternative. The tax is at a rate, determined by the tax commissioner, equal to the average rate which the excise tax paid by foreign and domestic corporations was upon their income for the preceding year. It is probable that similar methods will be used in other states.

Methods Adopted. — The first method is that which has been generally in use, except that the meaning of competing capital is limited, as shown above. There has been no final judicial interpretation of this limitation; but if a decision of a lower court (Peo. ex. rel. Buskirk v. Goldfogle, 205 N. Y. Supp. 870), which has been appealed, may be taken as an index, it appears that the meaning of competing capital may be restored to what it was supposed to be prior to the Richmond decision.

In any event, only one method can be used. States which impose upon shares of bank stock the same rates as upon general property, and in addition employ state income taxes are thus prevented from taxing the income of national banks, although the federal law imposes no bar to the taxation of income of state banks. Four states, namely, Missouri, North Dakota, Montana, and Tennessee, tax the shares as property, and besides tax the income of state, but not of national, banks. Such a condition is of course one of favoritism to national banks; it appears to be neither equitable nor stable.

While the meaning of the amended section 5219 is not yet judicially determined, cases are pending in several states, for example, New York and Kansas. As to bank taxes levied prior to 1923, however, the case is quite clear. Taxes in excess of those sanctioned by section 5219 before its amendment can be recovered except where on technical grounds, such as failure to protest on payment, or failure to bring suit within set time limits, the action will not lie. Thus in a Minnesota case (203 N. W. 874) recovery was allowed; while in a Massachusetts case (300 Fed. 29) the complaint was brought too late.

In most of the states the value of the shares, with local variations, continues as the base of the tax. There have been complaints of unequally heavy assessments of bank stock as compared to the assessments of general property. Nebraska, in a law of 1925, compromised this question by requiring bank stock to be assessed at 75 per cent. of true value, while other property continues legally assessable at 100 per cent.

AUTOMOBILE AND LICENSE TAXES

By Charles P. White
Instructor at University of Pennsylvania

Automobile Taxes.—The feature of the new legislation with respect to automobile licenses during 1925 was the widespread tendency to impose differential rates upon the owners of automobiles and trucks operated for hire. Apparently the argument of railroad officials that their competitors should not be furnished a free roadbed by the state is becoming effective, for a number of states either made for the first time a distinction between commercial and non-commercial vehicles, or increased the differences in actually existing rates.

The simplest type of distinction is that found in the North Dakota law. All motor vehicles pay a basic fee of ten mills on the dollar of factory selling price, and commercial passenger vehicles are charged an additional fee of $10.00 per passenger, based on the seating capacity of the vehicle. Trucks not used in commercial trucking pay fees graduated from $5.00 for a one-ton truck up to $60.00 for a five-ton truck. Trucks used for commercial freighting are taxed approximately twice as much.

However, by far the most common type of the new legislation is that which taxes the gross earnings of commercial vehicles. A list of the states enacting such a tax, with the rates imposed, follows:

California	4%
Connecticut	3%
Idaho	5%
Nevada	4%
North Carolina	6%
South Dakota	3% and 4%

California allows a deduction for city and county licenses or taxes; Connecticut imposes the tax only on bus companies operating solely within the state, and allows a deduction for town taxes on tangible property; Nevada also permits the deduction of any registration license fee; South Dakota imposes two rates—3 per cent. on gross earnings of vehicles equipped with pneumatic or semi-pneumatic tires, and 4 per cent. for vehicles not so equipped.

A third method of imposing higher rates on commercial vehicles is found in the Iowa and Oregon laws. The Iowa legislation requires monthly reports from motor transportation companies showing the miles of road covered, and the county in which the travel occurred, and on the basis of such reports taxes are levied at the rate of one fourth or one half cent per ton mile of travel, the higher rate being levied on vehicles equipped with hard rubber or solid tires. The Oregon law requires passenger motor carriers to pay three fourths of a mill per passenger mile, and freight motor carriers, one mill per ton mile.

The tendency to make a distinction between pneumatic and solid-tired vehicles appears to be well established. The new South Dakota law imposes fees ranging from $20 to $100 upon Class C and D commercial motor carriers, the fees being based on the rated tonnage capacity. This basic schedule is for trucks equipped with pneumatic or semi-pneumatic tires, while the rates for hard tires are 33⅓ per cent. larger. South Carolina provides for the basic schedule to apply to vehicles with hard tires, with a 50 per cent. reduction for all trucks and trailers using pneumatic tires.

In two states laws passed during 1925 provide for the classification of motor trucks according to the type of property transported. The Minnesota law creates three classes. The first class, consisting of trucks transporting agricultural and dairy products, is required to pay 2.4 per cent. on the base value, while the second and third classes pay 5 per cent. and 10 per cent., respectively, depending on the nature of the business engaged in. An Oregon statute also classifies commercial vehicles according to the type of business engaged in. Six classes are created, and the rates vary from ¼ of a mill to 1 mill per ton-mile or per passenger mile.

Nevada has taken a step toward decentralization of the registration system by requiring that county assessors register each motor vehicle and collect the license fee.

The following states enacted legislation providing for a change in the distribution of the proceeds of motor license fees: Oklahoma, Michigan, South Dakota and Idaho.

Several states increased the registration or license fees. The Oklahoma law doubles the rates on cars for which the manufacturer's list price is in excess of $500. Wyoming increased fees by $1.00 for each passenger-seating capacity in excess of seven. A New Mexico law requires commercial cars to pay $3.00 for each passenger carrying capacity in addition to the regular fees charged other cars. Missouri, through an initiative measure passed in 1924, increased fees by 50 per cent., and detailed increases were also made in Florida, Connecticut, and Kansas.

Laws passed in the following states result in a reduction in fees: Ohio (a decrease of approximately 50 per cent. for passenger cars); South Carolina (a decrease varying from ¼ to ½); Indiana (approximately ½); Nevada, New Hampshire and Nebraska. In both Nevada and New Hampshire the fees are based on weight.

License Taxes.—A number of states have increased the licenses or fees required of manufacturer's of cigars and cigarettes. A new law passed by North Carolina, for example, increased the maximum tax from $2,000 to $7,500, the latter being required when the annual output of cigarettes is in excess of 10,000,000,000. A new schedule of rates was also imposed on the manufacturers of cigars with the maximum placed at $15,000 on an annual output in excess of 50,000,000 instead of $1,000, as formerly. A new tax of $10 is imposed on retailers in certain towns.

In North Dakota a law was passed requiring $100 to be paid for the issuance of a permit for the sale of cigarettes, cigarette papers, or wrappers and tubes. In addition, cigarettes, papers, wrappers and tubes are placed in four classes and a graduated scale of rates based on weight and numbers is imposed.

South Dakota also increased the rates on cigarettes. The law also authorizes the state food and drug commissioner to issue licenses to sell cigarettes and cigarette papers on railway trains, and to collect $10 for such licenses.

Oregon has provided that retail dealers in cigarettes, papers, wrappers, tubes, smoking tobacco and snuff shall pay $2.00 for a license to engage in such business. A stamp tax based on the retail price of cigarettes is also imposed.

In South Carolina a new law provides for a license on soft drinks, certain cosmetics, chewing tobacco and snuff, the tax being based on the sales. In general, the rate averages about 20 per cent. of gross receipts.

In addition to the above enactments a number of states have made slight changes in license fees which are not of great general interest.

PUBLICITY OF TAXES

By Alzada Comstock
Professor at Mount Holyoke College

Statute of 1924.—Criticism of the income-tax publicity which was enacted as a part of the Revenue Act of 1924 continued to be heard in 1925. The legislation provided that the Commissioner of Internal Revenue should make available to public inspection, in the office of the collector of each internal-revenue district and in such other places as he might determine, lists containing the names and post-office addresses of all persons making income-tax returns in such district, together with the amount of income tax paid by such persons.

History of the Law.—The question of income-tax publicity had not been a controversial one in the United States since the Civil War period. The first income tax law, that of August 5, 1861, contained a reference to "said taxes, when so assessed and made public"; and although this expression did not appear in the Act of July 1, 1862, or subsequent acts, income tax lists were published and printed during parts of the period, before the income tax ceased to be operative in 1871, with the consequent provocation of controversy. From that time until the passage of the Act of February 24, 1919, the taxpayer's right to privacy was respected.

The foundation for the publicity provision in force in 1925 was laid in the Act of February 24, 1919, in the section providing that the Commissioner of Internal Revenue should make available to public inspection lists containing the names and addresses of persons making income-tax returns. This section was reënacted in the Revenue Act of November 23, 1921, without change. Finally, in the Revenue Act of June 2, 1924, the words "together with the amount of the income tax paid by such person" were added.

Official Opinion.—In the President's message to Congress on December 3, 1924, it was stated that the President believed the practice to be detrimental to the public welfare and bound to decrease public revenues, so that the provision ought to be repealed. The annual report of the Secretary of the Treasury for the year 1924, issued at about the same time, contained fuller statements of the same contention. Secretary Mellon stated that aside from the question of the unnecessary violation of the right of privacy which should be assured to all citizens in the spirit of the Fourth Amendment to the Consttution, publicity was wholly unnecessary from an administrative standpoint. It was difficult to imagine any one thing, he continued, which would be a greater spur to the efforts of all taxpayers to avoid a taxable income than the threat that the amount they paid would be pilloried. The Secretary also noted the fact tha Congress has specifically reënacted the section which penalized the printing or publication of any part of a return, and that no attempt had been made to reconcile these two sections.

Suits.—On May 25, 1925, an important decision regarding publicity was rendered by the United States Supreme Court. Not long after the passage of the Revenue Act of 1924 the records of the sums paid by the income-tax payers of the United States were made available for public inspection. The newspapers followed the public interest by publishing the names and the amounts paid. Attorney-General Stone at once brought suit against three newspapers which had taken this action, on the ground that the printing or publication of any part of a return was prohibited by a section of the Revenue Act of 1924.

The Attorney-General stated that the cases were instituted to test the question of the legality of the publication of information based upon portions of income-tax returns; that the names selected as a basis for indictment of the several newspapers were picked at random, without suggestion or complaint of any nature from the taxpayers mentioned; and that he hoped by this action to get a Supreme Court decision on the publicity sections of the Income Tax Law before March 1, 1925.

Judicial Review.—The lower courts dismissed the indictments against the newspapers, and the Supreme Court affirmed the lower court in the appealed case (*United States v. Dickey*, U. S. Sup. Ct., May 25, 1925). The court declined to consider the wisdom of secrecy, as being a question for Congress, and also found it unnecessary to deal with the constitutional question of whether a statute forbidding publication contravened the First Amendment of the Constitution. It found the question to be one of statutory construction, and held that the statute in question, section 257 (b) of the Revenue Act of 1924, was a definite declaration by Congress that the information should be public property.

Mr. Justice Sutherland, in holding that the newspapers were within their rights in publishing lists of income taxpayers and the amounts of their taxes, said: "Information, which everybody is at liberty to acquire and the acquisition of which Congress seemed especially desirous of facilitating, cannot be regarded otherwise than as public property, to be passed on to others as freely as the possessors of it may choose."

New Agitation.—When the federal income-tax returns were again opened to public inspection on September 1, 1925, the public sentiment appeared to have changed somewhat, for a few newspapers in the large cities refused to publish lists on the ground that such publication was an unwarranted invasion of privacy. Others, however, were apparently unaffected by the current protests against the use of the information in this way, and facilitated the satisfying of individual interest by publishing pages of names of taxpayers together with the amounts of income tax paid.

Opposition to the publicity provision was expressed again by Secretary of the Treasury Mellon in his statement before the Ways and Means Committee of the House of Representatives at the opening of the Committee's hearings on the tax reduction bill on October 19. Mr. Mellon advocated the repeal of this section on the grounds that it was utterly useless from a Treasury standpoint, for inquiry revealed the fact that no additional tax had been collected due to the publicity provision, and, obviously, it was unnecessary for the Treasury to get its information as to what taxes a taxpayer pays from publication in the newspapers; and that publicity encouraged further tax evasion and loss of revenue. He added: "There is no excuse for the present publicity provision except the gratification of idle curiosity and the filling of newspaper space at the time the information is released," and noted that no other country published such information.

Present Status.—In the bill which was prepared by the Ways and Means Committee for action by the House in December the publicity clause was revised, and the privileges of the public were restricted approximately to those which it enjoyed in 1921. The bill would permit inspection of returns on order of the President, by the Ways and Means and Senate Finance Committees, and by other committees of either body, especially those which are concerned with taxation matters. The Commissioner of Internal Revenue was directed as before to make available to public inspection, in such manner as he may determine, in the office of the collector in each internal-revenue district and in such other places as he may determine, lists containing the names of individuals making income-tax returns, but the very important provision that "the amount of the income tax paid" by such persons should be included in the lists was eliminated.

When the Ways and Means Committee concluded its work upon the bill in November the press commented that the repeal of the publicity section was one of the parts of the bill which would meet determined opposition. It was estimated that at that time a small majority of the Senate favored the retention of the publicity clause.

XII. TAXATION

STATISTICS OF TAX COLLECTIONS

[On basis of reports of collections [1]]

The following table of tax collections in the United States is compiled from the annu report of the Secretary of the Treasury for the fiscal year 1924-1925. Revenues derived fro specific commodities such as spirits, tobacco, etc., have been omitted.

Fiscal year	Income and profits [2]	Estates	Manufactures and products [1,3]	Sales (consumers' or dealers')	Stamps
1916......	$124,937,252.61	....	....	....	$42,196,443.
1917......	387,382,343.96	$6,076,575.26	....	....	8,926,310.
1918......	2,852,324,865.89	47,452,879.78	$36,570,478.37	....	21,874,734.
1919......	2,600,783,902.70	82,029,983.13	75,598,257.17	$2,301,989.95	45,251,358.
1920......	3,956,936,003.60	103,635,563.24	216,230,346.67	45,310,351.30	87,687,246.
1921......	3,228,137,673.75	154,043,260.39	177,802,191.37	45,794,878.32	75,664,840.
1922......	2,086,918,464.85	139,418,846.04	143,942,311.65	28,128,719.27	58,224,526.

DIVISION XIII
DEFENSE AND ARMAMENTS

ORGANIZATION OF THE ARMY

By William Addleman Ganoe
Major, U. S. A., Army War College

ORGANIZATION

Army of the United States, as it now stands, was created by the National Defense Act of 1920 in the proportion of one half Organized Reserves, one third National Guard and one sixth Regular Army. Thus, over 80 per cent. of our officer personnel is composed of men whose main pursuits are civilian. A comparatively small permanent force, the Regular Army has, besides policing our territory and doing some very vital industrial work, the double duty of keeping itself educated in the complex technique and practice of modern war and of passing the essentials of that knowledge on to the National Guardsman and the Reservist. The above legislation was made principally at the instigation of ex-service men, when the lessons of the late war were yet vivid, in order to overcome in the future the waste and confusion characterizing our previous wars. It has thus come about that the military forces of the country are placed upon the most democratic, suitable and economical basis they have ever occupied, so that the nation enjoys its first real military policy. The practical purpose of the triple components of this new army is to have the small Regular Army, in case of emergency, bear the brunt of the first line of defense, even to annihilation, but at least until the National Guard and Organized Reserves can mobilize to go to the front. On June 30, 1925, the strength was as follows: Organized Reserves, 72,191 officers, 5,116 enlisted men; National Guard, 11,114 officers and 166,411 enlisted men; Regular Army, 12,462 officers and 122,792 enlisted men for a population of 126,732,318 people.

War Department, as the managing agency of the military forces for the people, is presided over by the Secretary of War, a civilian, who is answerable directly to the President of the United States, the Commander-in-Chief. The Secretary (Mr. Dwight F. Davis), in turn, is assisted by the Chief of Staff (Major General John L. Hines), who oversees the military functions, and by the Assistant Secretary of War (Mr. Hanford MacNider), who has charge of the supply, real estate and war industrial plans. These three, two civilians and an army officer, constitute the War Council.

Subdivisions.—Under the Secretary of War are activities of Insular Affairs, the Panama Canal, Inland and Coastwise Waterways, River and Harbor Improvements, with other civil work; as well as the branches of the army: Infantry, Cavalry, Field Artillery, Coast Artillery Corps, Air Service, Corps of Engineers, Signal Corps, General Staff Corps, Adjutant General's Department, Inspector General's Department, Judge Advocate General's Department, Quartermaster Corps, Finance Department, Medical Department, Ordnance Department and Chemical Warfare Service, Officers of the Bureau of Insular Affairs, and officers and enlisted men of the Militia Bureau.

Territorial Distribution. — The army is scattered over the United States, Hawaii, Panama, Alaska, Porto Rico, the Philippines and China, not including military attachés and the like in other countries. Nine corps area commanders in the United States and department commanders in Hawaii, Panama, Canal Zone, the Philippines and China operate directly in the chain of command under the Secretary of War and Chief of Staff, as follows: First Corps Area, including Maine, New Hampshire, Vermont, Massachusetts, Rhode Island and Connecticut, is commanded by Major General André W. Brewster; Second Corps Area, including New York, New Jersey, Delaware and Porto Rico, by Major General Charles P. Summerall; Third Corps Area, including Pennsylvania, Maryland, Virginia and the District of Columbia, by Major General Douglas MacArthur; Fourth Corps Area, including North Carolina, South Carolina, Georgia, Florida, Alabama, Tennessee, Mississippi and Louisiana, by Major General Johnson Hagood; Fifth Corps Area, including Ohio, West Virginia, Indiana and Kentucky, by Major General Robert L. Howze; Sixth Corps Area, including Illinois, Michigan, Wisconsin, Jefferson Barracks and Arcadia Target Range, Missouri, by Major General William S. Graves; Seventh Corps Area, including Missouri (except as above), Kansas, Arkansas, Iowa, Nebraska, Minnesota, North Dakota and South Dakota, by Major General George B. Duncan; Eighth Corps Area, including Texas, Oklahoma, Colorado, New Mexico and Arizona, by Major General Ernest Hinds; Ninth Corps Area, including Washington, Oregon, Idaho, Montana, Wyoming, Utah, Nevada, California and Alaska, by Major General Charles T. Menoher; the Hawaiian Department, by Major General Edward M. Lewis; the Philippine Department, by Major General James H. McRae; the Panama Canal Department, by Major General William Lassiter; and the U. S. Army Forces in China, by Major General William D. Connor. These areas are again subdivided into tactical divisions and brigades under command of major and brigadier generals when such can be obtained.

Appropriations. — The appropriation for the army for the fiscal year 1925 was $334,553,786. Of this amount 23.3 per cent. went to purely industrial and civil use, namely, Rivers and Harbors, Flood Control, Muscle Shoals, Soldiers' Home and the Panama Canal; another 15.1 per cent. was spent directly or indirectly upon the civilian components. In addition, approximately 13 per cent. more went to the support of the overhead: education in the army and tests and experiments to keep abreast of the progress of other nations. As will be seen later, other money not included above was saved or spent upon the public at large. Thus, much less than half of the money available was left for the upkeep of the regular forces in their training and work in our extensive territory.

BRANCHES OF SERVICE

Infantry (Major General R. H. Allen, Chief).—Out of an authorized strength of 4,200 officers and 110,000 enlisted men, on June 30, 1925, there were actually 3,654 officers and 40,858 enlisted men. Since infantry is the basic arm, it alone having the power to enforce decisions in battle, all other branches are trained, organized and equipped to assist the infantry in its needs and functions. It comprises in its organization the essential combat and administrative elements which make its units self-sustaining. The infantry weapons are primarily the rifle and bayonet, and secondarily, grenades, pistols, automatic rifles, machine guns, three-inch trench mortars, 37 mm. cannon and tanks. The Chief supervises and controls the service schools within the branch, develops sound tactical doctrines for the infantry, procures necessary training regulations and gains team-work with other branches through higher authority. He particularly has his interest centered in peace time on the advancement of education at the Infantry and Tank Schools at Fort Benning, Ga., and Camp Meade, Md., respectively. Up to June 30, 1925, a total of 2,674 officers had completed courses at the former and 203 officers and 3,638 enlisted men at the latter. The course for Regular Army officers at the Infantry School is nine months and for other officers from six weeks to three months. Since the plant has to be large enough to give suitable terrain for all kinds of training, the present school occupies a reservation covering 97,000 acres. The graduates of both schools have been distributed among the regiments of the Regular Army, National Guard, Organized Reserves and the colleges. In this way infantry training is kept economically up to date.

Cavalry (Major General Malin Craig, Chief).—This branch has carried along throughout the year the army's training in that mobile arm. Since, in a large and open country such as the United States, night reconnaissance and counter-reconnaissance, security for large forces, quick seizure of positions, the containing of hostile forces, the break-through, the pursuit and raids can be accomplished almost exclusively by cavalry, it has had to train its personnel and animals along varied and comprehensive lines. Besides carrying out duties similar to those of the chiefs of other combatant branches, the Chief of Cavalry supervises the Cavalry School at Fort Riley, Kansas, occupying about 20,000 acres, for the education and training of all parts of our army in riding, horsemanship and cavalry leadership to the ends above stated. In the 1924-25 course 82 Regular Army officers, 17 National Guard officers, 10 Reserve officers and 4 Cuban officers took regular, machine gun, special advanced equitation and special courses. To gain some idea of the efficiency of the branch and this school, a single horse-show team of five cavalry officers and twelve horses during the past summer in the east captured 130 ribbons, many cups and other prizes. A similar team, now in Canada, will compete against teams of other countries at the National Horse Show in New York City, doubtless with credit to the United States. The Cavalry Board, in its work during the year, prepared, revised or reviewed 33 training regulations, tested 54 articles of equipment and submitted studies on equipment projects. At the Cavalry School are three schools for enlisted men. The Horseshoers' School turned out 41 men having finished Cavalry horseshoer's courses; the School for Bakers and Cooks turned out 244 men, who went as instructors to the National Guard, R.O.T.C., and Organized Reserve camps throughout the middle west; the Saddlers' School graduated 21 men.

Field Artillery (Major General William J. Snow, Chief).—This branch shows with its personnel and instruction a steadily increasing advancement, the enrollment in the R.O.T.C.'s for the past few years being an illustration: 6,011 for 1920; 7,165 for 1921; 7,552 for 1922; 8,043 for 1923; and 10,362 for 1924-25. Graduates of these courses were commissioned in the Field Artillery section of the Organized Reserves in numbers, as follows: 1921, 80; 1922, 263; 1923, 371; 1924, 370; 1925, 510.

Field Artillery School is located on the Reservation of Fort Sill, Oklahoma, adjoining the Wichita National Forest and Game Reserves. The school uses an area of 51,000 acres, whose extent furnishes a large and suitable firing area. The School includes a permanent Air Service Flying Field, where student officers who volunteered were given a special and additional course in aërial observation with special heed paid to observing field artillery fires. A battalion of Infantry has provided the means for study of Infantry formations and operations both in the classroom and field demonstrations. A riding hall, school stables and animals have afforded instruction in riding and draft. In the study of motors and tractors, the student has been required to don overalls, set up and assemble his tractor and to operate it in road tests.

In all instruction the aim has been to give the student a practical knowledge which will be essential to him, not only in his present grade but in the next higher. During the 1924-25 term, 113 Regular Army officers, including an Infantryman and one general officer, 51 National Guard officers, 25 Reserve officers, 4 Cuban officers and 1 Philippine Scout officer finished regular and special courses; and 78 enlisted men of the Regular Army and 17 of the National Guard finished specialist courses in Horseshoeing, as Saddlers, in Motor Mechanics, Gun Mechanics and Communications.

Seacoast Defense.—The modernization of our seacoast defenses was continued by the Chief of Engineers not only for this country but especially for the Panama Canal and Oahu. So far as funds are available, all essential installations were kept in proper repair. Since, with the increase in range and power of modern armament both afloat and ashore, fortifications must change or become obsolete, full use was made of recent developments in railway guns, in long-range searchlights, in anti-aircraft armament and in improved construction methods. In addition to the maintenance of modern fortifications, Congress authorized funds for the preservation of the historical forts at San Juan, Porto Rico, Fort Niagara, N. Y., and Fort Marion, Fla. This was carried out as intended, assisted, in the first case, by funds made available by the Government of Porto Rico. Under the Washington Treaty the fixed defenses of Manila Bay cannot be augmented but can and are being maintained in a reliable state of efficiency. The great Panama Canal, the naval base at Pearl Harbor, Oahu and the most important of our own coastal harbors are being made secure against hostile naval bombardment as rapidly as funds permit. During the fiscal year 1925 the Chief of Engineers had available for all these purposes the total sum of $1,171,413.

Board on Engineer Equipment at Fort Humphreys is constantly engaged in testing and developing essential tools and methods required by engineers in war. For example, the pontoon bridge material now in general use by the army is practically the same type as was successfully developed during the Virginia Campaigns of the Civil War. Equipage built and tested at Fort Humphreys, however, must replace the old type which is unable to support the heavy loads demanded by modern field forces. The "Advance Guard" pontoon boat built of an aluminum alloy and a new design of wooden pontoon, built slightly larger but of double capacity, are some of the results recently achieved. In developing the use of aërial photography for map-making, the Board is coördinating the work of the 29th Engineer Battalion (topog.) and of the detachment on duty with the Air Service at the McCook Field development station, as well as experiments in map-making carried on at the Engineer Reproduction Plant.

SIGNAL CORPS

This corps (Major General Charles McK. Saltzman, Chief Signal Officer), besides carrying on its training of the army in signal work, has benefited the country in industrial and scientific ways. The Corps laid a cable system of 4,588 statute miles between Seattle, Washington, and Seward, Alaska, from March 25, 1924, when the first load of cable left England, to October 9, 1924, when it was completed. It operated during 1925 the largest and most comprehensive radio net in the world for the following bureaus and departments: War Department, U. S. Veterans' Bureau, Department of Labor, Navy Department, Department of Justice, Shipping Board, Treasury Department, Department of Agriculture, Department of Commerce, Post Office Department, Department of the Interior, Interstate Commerce Commission, Panama Canal, Bureau of Public Health Service and Coast and Geodetic Survey. The net has grown from something which handled only a small part of the War Department business in 1922 to a service for practically all government rapid communication, with consequent saving to the United States. In electrical work the Corps' research and development at its various laboratories has been of a character which will aid commercial activities as well as military. Among other things, a heterodyne frequency meter was developed, which will measure accurately frequency above 2,000 kilocycles; a radio beacon, which will enable an airplane to fly to or from the station of the beacon on a given course; and a sound-ranging apparatus, not quite yet perfected, for the location of artillery and for subaqueous sound ranging. The Signal School at Fort Monmouth, N. J., graduated 58 officers and 126 enlisted men from all branches of the service in June, 1925. At that time the number of Reserve Officers in the Signal Corps was 2,161. In telephone work the Corps operated 131 switchboards and 19,375 substations owned by the government, and 5 owned commercially. In its meteorological work it kept in close coöperation with the Air Service, especially in the round-the-world airplane flight. The Corps has been exceedingly successful in its progressive training methods, especially by the use of films in instruction for its own personnel, and by furnishing them to other branches.

GENERAL STAFF CORPS

The main dependence of the Secretary of War and Chief of Staff, in the multifarious activities of the army, is organized with a Deputy Chief of Staff, five Assistant Chiefs of Staff, and other officers of the Regular Army, National Guard and Organized Reserve. The Deputy Chief of Staff (Major General Dennis E. Nolan) acts for the Chief of Staff in his absence and has general supervision as an executive. The five assistants are each in charge of sections known as G-1 (personnel), G-2 (collection, evaluation, and dissemination of military information), G-3 (organization, training and operations), G-4 (supply), War Plans Division (specific plans in conjunction with the Navy for national defense).

National Man-Power.—The G-1 Section (Brigadier General Campbell King, Assistant Chief of Staff, G-1) made minute and modern studies of the man-power of the country in connection with selective service for any contingency of war forced on the United States, with a view to saving the maximum number of lives against such a calamity. Even the use of women in industry was taken up, not only for the purpose of releasing men but also of disrupting the country's life, business and resources as little as possible.

Information.—G-2 Section (Colonel James H. Reeves, Assistant Chief of Staff, G-2), in addition to observing intimately military, economic and political happenings over the World as the "eyes" of the War Department, made fortunate translations of documents during the fiscal year, 1925, for the White House, the Navy Department, Department of Justice, State Department, Department of Agriculture, Treasury Department and Department of the Interior. It received and evaluated 12,069 reports of 46 countries, while it maintained a cordial liaison with military leaders and authorities of foreign nations.

Quarters.—G-3 Section (Brigadier General Hugh A. Drum, Assistant Chief of Staff, G-3) covered a wide field during the year. It found that probably the most hampering feature to operations and training of the army was the condition which placed 40,000 enlisted men, 2,000 officers and 10,000 animals under temporary shelter the year round in the United States. Both the present and former Secretary of War have pointed out the high sense of duty and patriotism of officers and men in carrying out their many duties while living in dilapidated and fire-exposed buildings, but have also shown the lack of economy in having troops spend a large part of their time, which should be given to more important duties, in repair of rapidly deteriorating quarters.

Education.—Falling under the purview of this Section is the education of the army of the United States, which may be classified into General and Special Service Schools, Enlisted Men's Schools, Correspondence Courses, R. O. T. C.'s at colleges and schools, R. O. T. C. Camps, C. M. T. Camps, National Guard and Reserve Officers' Camps. The General and Special Service and Enlisted Men's Schools [See table and schools mentioned under separate branches], being the sources and centers of military education in the United States, have run to capacity throughout the year, wherever funds permitted. The mission of the correspondence courses being to provide technical military instruction for members of the Reserve forces, for civilians who wish to become Reserve officers, and for Reserve Corps, National Guard and Regular Army officers in preparation for Service Schools, the education involved has been far-reaching; the enrollment for 1925 reached 20,797, an increase of 5,744 over the preceding year, the total number exceeding the combined student bodies of Harvard, Yale, Cornell, Princeton and Brown Universities. Three hundred and twenty-six R. O. T. C. units at 226 institutions gave an enrollment in 1925 of 125,504, which total would have run higher had funds been available. The growth of the number of graduates eligible for commissions is illustrated by the figure of 167 in 1920 as against 3,953 in 1924. The estimated attendance at the six-week R. O. T. C. summer camps for 1925 was 9,300; the actual attendance at C. T. M. camps, 33,975; and at National Guard and Reserve camps, 21,224 officers and 140,909 enlisted men. None of the above attendances include Regular Army personnel, which aggregated 9,707 commissioned officers and 85,625 enlisted men available, on June 30, 1925 in the United States, for carrying along this entire task of education and training. Four thousand forty-eight were already on permanent all-the-year-round duty with the National Guard and Organized Reserves, so that there was required for the summer camps practically all of the home strength of the combat branches of the Regular Army. Some conception of the magnitude of this education and training can be gained when it is known that, exclusive of care of animals and equipment, programs for regimental training call for the soldier to be proficient on over 50 subjects, and that a present force of approximately 118,000 enlisted men is required to carry on activities contemplated by the National Defense Act for 280,000.

Housing and Mobilization.—G-4 Section (Major General Fox Conner, Assistant Chief of Staff, G-4), during the year, took up specifically the housing needs of the army, the maintenance of the general army plant with the limited funds available and the disposition with greatest benefit to the United States of unoccupied military reservations. The Section made savings in the use of water over rail transportation. On the principle that the better the weapons, the fewer the men who need to be exposed to slaughter, and the more quickly is peace obtainable, it spent successful effort on the improvement of materials for war, and aided the Assistant Secretary in his problems of supply. Plans for the mobilization of industry in case of war have been perfected to the greatest extent the country has seen. To date, 15,000 facilities have been allocated and 17,000 commodity committees have been organized. In this connection the Chief of Engineers is making a survey of the power resources of the nation.

War Plans Division (Brigadier General Harry A. Smith, Assistant Chief of Staff, W. P. D.) has carried out studies for defense of our islands and coasts from attack by other nations, special attention having been given to anti-aircraft. In this work it secured the fullest coöperation of the Navy Department in its efforts to perfect the team-work necessary in resisting any outside aggression. It handled the Hawaiian Grand Exercises of April, 1925.

ADJUTANT GENERAL

Adjusted Compensation.—The Adjutant General's Department (Major General Robert C. Davis, Adjutant General), in addition to its growing duties connected with personnel, correspondence and records of the War Department, was called upon to perform a huge task for the public benefit—the administration of the Adjusted Compensation Act (the Bonus). The problem covered the cases of 5,250,000 men, whose records and applications had to be handled in a limited time, each record involving 27 separate checking operations. The Adjutant General set out immediately to borrow desks, tables, machinery and the like for temporary use, and with the coöperation of the Post Office Department, the General Supply Committee and other agencies in Washington, was able to obviate delay and save the government upwards of $289,000. Twelve million blanks were distributed on June 16, 1924, to every post of the American Legion, Veterans of Foreign Wars, Disabled American Veterans, every chapter of the American Red Cross, all agencies of the Army, Navy and Marine Corps, and the Veterans' Bureau, both at home and abroad, and to every possible office in the United States and its possessions, the distribution being completed on June 28. By being mailed so as to give the more distant points the preference in point of time, the receipt of applications was practically simultaneous. For the War Department it required at the peak 2,517 clerks. Some idea of the complications that were met is shown by the record of 50,328 Smiths, 40,101 Johnsons and 28,902 Browns, many having initials identical. In addition, 23 per cent. of those entitled to compensation could neither read nor write the English language. The task was concurrent with the regular load of 1,170,792 correspondence cases during the fiscal year June 30, 1925; the Information Section of the office alone furnishing replies to 60,071 applications, many of which were from civilians. By July 1, 1925, this vast work was completed to such a degree that the bonus could then be handled by the normal force.

Recruiting.—During the fiscal year, June 30, 1925, the army was maintained at an average monthly enlisted strength of 118,750, exclusive of Philippine Scouts, 49,479 enlistments and reënlistments being accomplished by the Adjutant General's Department. Fifty-five and one half per cent. of those discharged at the expiration of their service reënlisted within three months. The recruiting service in the field consisted of 100 officers and 950 enlisted men, distributed among 59 districts averaging six city stations each. Public buildings were utilized for officers wherever available, 96 stations being rented at an average cost of $26.44 per room. Advertising was supervised by the Recruiting Publicity Bureau consisting of four officers and 25 men under the direct supervision of the Adjutant General and located at Governor's Island, New York. Publicity expenses averaged $1.14 per enlistment. Recruiting costs, including pay and allowance of recruiting personnel, averaged $65.01 per enlistment for the fiscal year. During the third quarter when conditions permitted capacity production, the average cost was $21.27 per enlistment.

Activities of the Adjutant General's office were further extended in coöperation with G-1, especially in handling personnel, and in coöperation with G-3 in administering the educational work for the army of the United States.

INSPECTOR GENERAL

Major General Eli A. Helmick, Inspector General, during the year ending June 30, 1925, inspected the army of the United States with reference to instruction, disciplinary training, housing conditions, uniform, clothing, rations, desertions, trials, discipline, morale, court-martial procedure, money accounts, recruiting, property, transportation, medical attendance, sanitation, arsenals, depots, remount service, national military parks, disciplinary barracks and schools. To illustrate its activities: the department inspected during the year 485 accounts of disbursing officers and 543 posts, camps, stations, and transports; and in addition, made numerous special inspections and investigations involving matters of great importance to the government. The Inspector General himself inspected 41 stations in six corps areas and the Hawaiian Department; and the office in Washington alone completed 34 investigations, which required the usual unremitting labor and unbiased judgment in arriving at fair and logical conclusions. In one case, where a fraudulent over-payment of $36,000.00 was uncovered, not only did the investigation lead to recovery for the Government of a substantial part of the sum, but caused the institution of methods preventive of similar frauds. Although this department by its very mechanism must conduct its work without partiality or affection, it more than ever in 1925 has pursued the policy of helpful hints and advice wherever appropriate, so as to leave lasting correction without recourse to punishment or rebuke.

JUDGE ADVOCATE GENERAL

Major General John A. Hull, Judge Advocate General, is the legal adviser of the War Department and is responsible for the administration of military justice in the army of the United States. The Department's duties cover the consideration of the legal phases of business, property, financial operations and control of personnel. For the period ending 1925, approximately 22,500 court-martial cases have been reviewed on appeal since 1920. One section of the Department acted as an appellate court, reviewing every general-court-martial case with careful scrutiny for any errors which might have occurred in the trial. Since under the law every such case must undergo this review in writing—a review which corresponds to that of a state and federal appellate court in criminal cases—every substantial right of the accused has been safeguarded with the effect of maintaining a corrective discipline at once just, prompt and uniform. Whenever the circumstances of the case justified it, recommendation was made for clemency, with often the honorable restoration to duty of the offender.

A section of the Judge Advocate General's office acted as legal representative in the United States for the Insular Government of Porto Rico and the Philippine Islands in appellate cases before the federal courts in the United States, including the Supreme Court; and as legal adviser to the Chief of the Bureau of Insular Affairs in connection with the administration of the civil government of our Insular possessions.

SPECIAL DEPARTMENTS

Finance Department (Major General Kensie W. Walker, Chief) is charged with the disbursement of all funds of the War Department, and its chief is the budget officer. During the fiscal year 1925 the department paid its bills for supplies and services so promptly that the reduction to a cash basis has resulted in a saving of $214,818.98 to the government from commercial discounts. The salaries and wages of all troops of the Regular Army and Philippine Scouts were paid by this department during the year. To encourage the saving instinct in the soldier, he is allowed to deposit his money with the Finance Department at a small rate of interest; deposits for the year 1925 amounted to $1,384,686.68. Money deposited by the Finance Department with the Treasurer of the United States from surplus war supplies, other government property, interest, premiums and dividends on advanced payments during the World War to provide firms, rentals, service, reimbursements, trust funds, Engineers, Panama Canal and miscellaneous sources as a surplus and saving for 1925 amounted to $63,143,918.54. The Finance Department paid, during October, 1925, alone, to government and commercial life insurance companies for premiums of military personnel the sum of $238,266.13. It has paid out to widows for gratuity $695,920.45 since 1922; and in one month in 1925 paid to dependents $88,055.

Medical Department (Major General Merritte W. Ireland, Surgeon General) has brought the mortality and the venereal-disease rates during 1925 to the lowest mark in the history of the army. The death rate from disease is now less than two per thousand, and from all causes, less than four per thousand. For the quarter century ending 1925 the incidence of venereal disease has declined 69 per cent. and malaria 98.7 per cent. During the year the Medical Department of the army conclusively demonstrated for the benefit of the world that the method of transmitting dengue fever was by mosquitoes, the detailed researches in connection with this study being as complete as those conducted for yellow fever by Walter Reed and his Army Medical Associates in Cuba immediately following the Spanish-American War.

Ordnance Department (Major General Clarence C. Williams, Chief) see p. 360.

Chemical Warfare Service (Major General Amos A. Fries, Chief) is charged with the investigation, development, manufacture, procurement and supply of all smoke and incendiary materials, all toxic gases and all gas-defense appliances, and the instruction of the army of the United States in such matters. Since it is now an established fact that gas is the most humane of all destructive agents, and that this branch of the army is aiding industry over a wide field, it is evident that the Chemical Warfare Service has been much misunderstood. Statistics of the Surgeon General of the Army for the World War now show conclusively that 24 per cent. of all those wounded by weapons other than gas, died, whereas less than 2 per cent. of the gas casualties proved to be fatal. It is estimated that not more than 200 men were killed by gas on the field of battle. In industry since the war the developments of the Chemical Warfare Service have been of great benefit to the country. At the request of the Public Health Service, the Chemical Service undertook to make the fumigation of ships, from which there have been numerous casualties, safer and more efficient; by mixing tear gas with hydrocyanic gas, the Service has reached a state of experimentation in 1925 where the safety of ship fumigation is assured. The Service has also aided the Bureau of Mines in developing a gas mask that would render absolute protection to the miner against the deadly carbon monoxide, this discovery alone justifying the money spent on chemical warfare research. Heretofore, whenever a leak occurred in pipes of ammonia refrigeration, men were prevented from approaching the burst on account of the deadly fumes; the Chemical Warfare Service discovered silica gel, which in a mask affords adequate protection. In the extermination of pests the Service has aided the Bureau of Biological survey and Bureau in Entomology, ridding crops of rats, gophers, locusts, grasshoppers and many other destructive animals and insects to the extent of saving millions of dollars. In spraying of fruit trees, the Service has devised a simple and successful method of covering the orchards rapidly and widely by airplanes. The Service during the year has aided the Bureau of Explosives and Interstate Commerce Commission in the transportation of explosive and toxic agents by devising rules and regulations based on the mass of experience gained by the personnel of the Service. It has also aided police departments in their use of chemical agents against mobs and bank robbers, especially as to the safe handling of these commodities. It is estimated that many lives have been saved by the Chemical Warfare Service in peace since the War.

ARTILLERY AND ORDNANCE

By William Addleman Ganoe

Major, U. S. A., Army War College

COAST ARTILLERY CORPS

Personnel and Material. — The Coast Artillery Corps (Major General F. W. Coe, Chief), during 1925, improved its development of personnel and material for its primary roles of long-range firing at land and water targets, and at targets in the air. With the country's extensive coastline, most of the Corps' defensive plans are based upon the protection of our shores against an enemy advancing from a landing base which he must first secure by combined operation of his army and navy, supported by a large force of aircraft. Coast Artillery having the double duty of attacking the enemy's vessels at long range, and of bringing down his aircraft, accomplishes its first mission by three types of long-range guns classified according to their method of mounting and transportation, as fixed artillery (fortification), railway artillery, and tractor-drawn heavy artillery; and its second mission, by three types of anti-aircraft weapons, the 3-inch gun, the heavy machine gun (especially adapted for anti-aircraft fire) and the high powered searchlight accompanied by its listening devices which locate aircraft at night by sound.

Coast Artillery School.—The training of officers and selected enlisted men for these highly specialized duties is carried out at the Coast Artillery School, Fort Monroe, Virginia, the second oldest institution of learning in the army, which has for more than 100 years carried along the education of artillery officers on this appropriate site. The courses at the present time include instruction in the tactics of artillery, methods of gunnery, electrical and radio engineering and motor transportation. For captains and lieutenants, the technical detail of these subjects is very thoroughly covered, and the principles applied by practical instruction. In the advanced course for senior officers, the instruction is along broader lines. During the past year the following number of officers have successfully pursued these courses—Battery officers: 34 Regular Army, 2 Cuban Army, 17 National Guard, 8 Organized Reserves—Field Officers: 35.

A very desirable feature of the courses for selected enlisted men is that the students are fitted for professions in civil life after their separation from the Army. The courses cover the following: Electrical Engineering, Radio Engineering, Motor Transportation, Stenography, Typewriting and other clerical work, Mechanical Drafting, Engraving and Photography. Since no restriction prevents graduates from going into a profession in civil life, many men who have received their entire education in the Coast Artillery have later successfully engaged in technical professions outside of the Army. In 1925, 67 men completed these courses.

Long Range Armament.—Aside from development in methods of defense against aircraft, the principal development in the Coast Artillery during the past few years has been along the lines of training in the use of high-powered mobile types of long-range armament capable of operating with a mobile army. Such development avoids the necessity of placing in permanent fortifications a large amount of expensive installation which is of no value at another part of the coast-line. By holding the reserve of railway artillery at a centralized point, the excellent railway net in this country can be used to concentrate at a threatened locality a large amount of this type of artillery, in order to engage enemy naval vessels and troop transports before they can come within striking distance of the coast.

In November, 1925, the "pilot" 14-inch railway gun, made and perfected by the Ordnance Department, was sent across the continent to Fort McArthur near Los Angeles, California, from Aberdeen Proving Ground, Md. The gun and carriage weigh 365 tons or as much as a heavy locomotive. A careful survey of the capacity of the transcontinental railroads preceded the movement of this heavy gun, which was made at limited speed until smooth-running was assured, and then at higher speed. The trip was without breakdown or incident, demonstrating that heavy artillery so mounted can be taken from coast to coast in a week or less.

Coast Defense Guns.—The most powerful weapons ever designed are the 16-inch coast-defense guns recently made by our Ordnance Department and added to a number of our important fortifications. Their maximum range is 50,000 yards or over 28 miles; the projectile, of forged steel, weighs 2,340 pounds. A method of installing these new guns has been followed, which is intended to reduce the probability of their being successfully neutralized by either ships' guns or airplane bombing. The guns, magazines and position-finding installation are so dispersed over the terrain and concealed, that the target presented to an enemy is less than that of the older small-calibre batteries. A number of these superpowerful batteries have been completed.

Similar development has been made with heavy artillery of medium calibre which is drawn by tractor. The object to be obtained is generally the same—the concentration of this type of artillery at a threatened point.

Defense Against Aircraft. — The most important recent development in the Coast Artillery has been with the means of defense against aircraft. The efficacy of anti-aircraft gun fire having been questioned by witnesses appearing before a Congressional Committee conducting hearings on Air Service matters during the winter and spring of 1925, the War Department initiated measures to obtain definite information on which sound conclusions could be based. During the summer an extended program of anti-aircraft firings at targets towed by airplanes was held at Fort Tilden, Long Island, these firings being by day and by night, with 3-inch guns for distant targets and machine guns for low-flying targets.

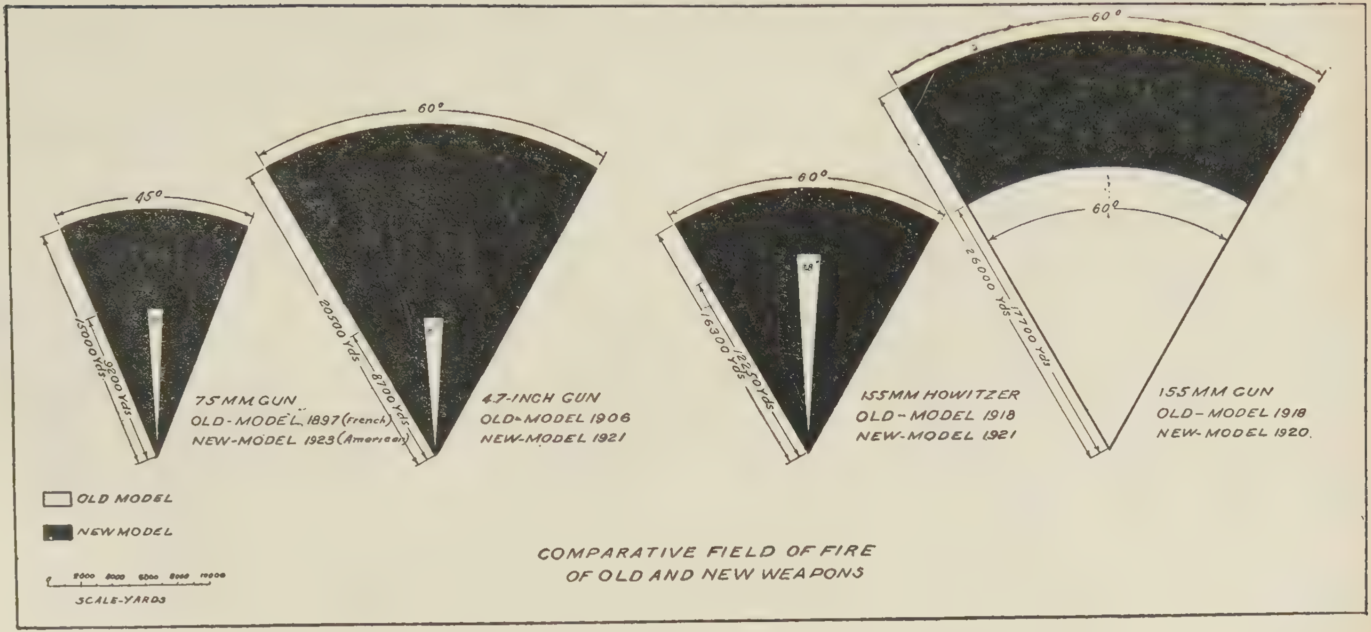
The following results were obtained with the 3-inch guns.

Number of shots fired	4,343
Number of hits	203
Shots per battery (4 guns) per minute	43
Hits per battery per minute	2.03
Percentage of hits	4.6

The guns and the ammunition used during the Fort Tilden test were of war manufacture, far inferior in range and accuracy to guns which since have been designed and tested. The improvement shown to have taken place is due in the main to improved range findings, apparatus and methods.

ORDNANCE DEPARTMENT

This branch of the service (Major General Clarence C. Williams, Chief) is charged with development, maintenance, preparation and supply of ordnance materials. During the year, 24 officers graduated from the Ordnance School at Watertown, Mass., and 31 enlisted men from the Specialists' School. Two ordnance officers were detailed to the plant of Holt Mfg. Co., Stockton, California, and one other to the offices of E. I. Dupont De Nemours and Co., Wilmington, Del., for the purpose of familiarizing themselves with the work of civilian plants and of allowing the heads of those establishments to gain a knowledge of the wants of the army. Plants for the prompt and efficient utilization in war have been the subject of constant study in the Ordnance office, since it was clearly demonstrated during the World War that the decentralization of contact with industry through procurement districts was vital to successful operation of ordnance activities. The district system has been revised and has been in operation for nearly three years. Fourteen procurement districts have been organized, each with a permanent, local civilian as chief and a Regular Army officer as executive assistant. Each district has been engaged in surveying manufacturing plants, placing tentative orders for material with these plants and supplying information to prospective contractors, the response being encouraging and the interest keen. The Browning machine gun, calibre 50, was approved as an anti-aircraft weapon. Machine rifles, pistols, divisional, corps, and army artillery, especially the railway and seacoast weapons, and tractors and reconnaissance vehicles have been signally improved. A noteworthy achievement was the development of X-ray in the investigation of steel and other metals as an outstanding feature of the year. Not only is the composition and structure of metals by this means understood but defects are located and discovered which would not otherwise be visible. The matter has already been taken up by commercial concerns and should be a valuable addition to scientific industry. Other researches at the Picatinny Arsenal, especially in propel-



COMPARATIVE FIELD OF FIRE OF OLD AND NEW WEAPONS lant powders in conjunction with the Dupont Company, have resulted in some very marked advances in explosives. In addition, considerable research work as to the flight of bombs dropped from aircraft has been undertaken in connection with tests of these bombs.

ARMY AËRONAUTICS

By Major W. A. Ganoe, U. S. A.
Historical Division, Army War College

Service to General Aeroplaning.—The Air Service (Major General Mason M. Patrick, Chief), working in coöperation with the Navy, the National Advisory Committee for Aeronautics, the Post Office Department and the Bureau of Standards, has not only contributed signally to the healthy infancy of the comparatively new science of flying, but has been of great benefit to industry in general. In conjunction with the Information Division, the Engineering Division of the Service has in the past five years collected, digested and disseminated to the public a tremendous amount of technical data; and has aided in the perfection and standardization of nomenclature, of mechanical processes, of methods of analysis of designs, and of procedure in the static and flight test of complete airplanes. The Engineering Division has prepared a *Designers Handbook*, a *Book of Standards* and a series of *Specifications* which, while intended primarily for the use of manufacturers dealing directly with the army, have come to be looked upon throughout the field of aviation in this country as the most valuable works now extant on the subject. These, together with *Information Circulars* and other technical publications prepared by the Air Service, are used either as text books or references in nearly all universities where courses in aeronautical engineering are given. Many of them are in demand for similar purposes in foreign countries.

The Air Service furnishes to school boys information on the construction of models and gliders; to older children material for study and debate on aeronautical subjects; to journalists aerial photographs from the files of the Army Air Service; to inventors (no matter how radical or impracticable may seem their ideas) sympathy, interest and advice; and to builders assistance and guidance in the great task of perfecting types of planes and engines suited to the many purposes for which aircraft may be advantageously employed. Probably in no other field does the Air Service exert a stronger influence toward the perfection of commercial aviation, than in that more or less intangible one of information and education.

The Army does not limit itself in this great work to the dissemination of advice, theories and formulae. It has devoted much time and effort to practical demonstrations and has developed many of the most progressive and important items of equipment. The parachute developed by the Army Air Service is used throughout the United States by civilian as well as military fliers, and has been adopted by the Canadian Air Force and by the Royal Air Force of Great Britain. Since its perfection, no instance of malfunctioning has been recorded, and many lives have been saved as a direct result of its use.

The supercharger developed by the Army Air Service has greatly improved the range and climbing ability of aircraft and is now being applied with great promise to truck and motor vehicles operating habitually at high altitudes. As commercial airplanes differ from military only in the matter of armament and in the modification of performance characteristics, the application of navigation instruments and of other equipment and accessories perfected by the Army to civil aircraft is immediate. The Alaskan Flight, the Porto Rican Flight, the Non-stop Transcontinental Flight, the Dawn to Dusk Transcontinental Flight, the Round the

World Flight, the annual International Air Races, and many others have been conducted by the Army Air Service to demonstrate the capabilities of aircraft, to promote confidence in air travel and to stimulate design competition. With our entry into the World War the Air Service Engineering Division at Dayton, Ohio, laid the foundations for a sound and progressive aeronautical engineering policy, to which more than to any other single influence may be attributed the standing of this country in the world of aviation to-day. Since the development of airplanes is a long and tedious process, involving painstaking research and exhaustive inquiry into new and unexplored fields, the design and construction of aircraft must necessarily be attended by many costly mistakes. Considerable sums must be devoted to experiments which when completed may prove to be fruitless except as an indication of what not to do. The vast aeronautical industry built up during the war disappeared almost completely after the armistice.

Service in Forest Fires.—During the summer of 1919 the Secretary of War, at the request of the Secretary of Agriculture, authorized the establishment on an experimental basis of aerial forest fire patrols by the Army. In 1920 an appropriation by Congress of $50,000 made possible the improvement and expansion of this service. As a result in that year Army airplanes flew a total of 476,085 miles over nine patrol routes in Washington, Oregon and California. Of 1,338 fires occurring in all National Forest Preserves of California during July, August and September, the air patrol reported 772. Since much depends upon the early determination of the existence and of the exact location of fires, the airplane, through its speed and ability to cover otherwise almost inaccessible areas, proved to be of great value in this work. No doubt these results would have been greatly exceeded had it been possible to continue operations on the same scale for several years more. Unfortunately the appropriations for the purpose since 1920 have been greatly reduced and the shortage of commissioned personnel together with the heavy demands of the summer training period have made it impossible for the Air Service to take the same active part as in 1920. In 1925 ten DH 4B planes with necessary equipment were furnished by the Army and were flown on patrol by Reserve Officers paid from the funds of the Department of Agriculture.

Writing of the work of that part of the 9th Aero Squadron operating out of Mather Field during the summer of 1920, Paul G. Redington, Forester in charge of the California district, states that 33 per cent. of the 196 forest fires discovered and reported were accurately located. "And 'accurately,'" says Mr. Redington, "in this case means that these locations given us by the airplane fire patrols were all within one-fourth mile of the exact location as later determined by actual surveys on the ground.

"This record, when supplemented by the further facts that an additional 19 per cent. of the fires discovered were reported within one-half mile of their actual location, that 10 per cent. of the total numbers were discovered by the air patrol before the rangers knew they even existed, and that 42 per cent. or 83 of the fires were reported by radio, while the ships were in flight, demonstrates without a doubt that airplane fire patrol in California has been successful.

"Besides acting as lookouts to detect and report fires, airplanes were used this year to direct fire fighting operations and to patrol fire lines which have been established, but which needed watching to see that the flames did not get beyond control. The case of the Mill Creek forest fire, on the Lassen National Forest, where 25,000 acres were burned over, is an example. Here a special reconnaissance plane, equipped with radio and with a forest officer for observer, hovered over the fire and actually directed the movement of bodies of fire fighters by wireless messages received right on the fire line. In addition this plane patrolled twice each day some fourteen miles of completed fire lines, from which all men had been removed. If reports from the air showed the line to be clear, the fire fighters were kept at work elsewhere, but if the observer wirelessed in that the fire had broken away, then a force of men was rushed to the spot and the fire corralled again."

Miscellaneous Service.—In conjunction with the Department of Agriculture the Air Service has carried out experiments which demonstrate the feasibility of employing airplanes for the control and extermination of insect pests. Successful campaigns have been waged in various localities against the gypsy moth, the boll weevil and against locusts. As a result, at least one manufacturer has constructed planes especially for this purpose and is entering upon the work with every expectation of continual and profitable employment.

On several occasions the Air Service has been able to avert impending floods by bombing ice jams.

Food and medical assistance have been carried by the Air Service in several instances to people at isolated, and otherwise inaccessible points. In one case the relief measures after a serious flood were expedited and made much more effective as a result of preliminary surveys by the Air Service.

The Air Service was the first in this country to undertake the systematic operation of aircraft over long aerial routes or airways—a thing done to demonstrate the practicability of aerial transportation, to inspire confidence in aircraft, to develop operational methods and to promote the establishment of a comprehensive system of airways. A Model Airway was established linking up the Army Fields at New York, Washington, Hampton, Va., and Dayton, Ohio. The Air Service has made efforts to improve the character of meteorological service by the Signal Corps and the Weather Bureau; to encourage newspapers to publish "Flying Forecasts"; to have towns and cities along the model airways and along all other proposed routes throughout the country establish municipal landing fields. Since railroads are prominent landmarks for aviators, the Air Service has asked a number of companies to place the names of cities and towns in large letters visible from the air, within their right-of-way areas. At its request chambers of commerce and like organizations have painted the names of their towns or cities in large letters on the roofs of prominent buildings.

During the year radio direction-finding has been perfected by the Air Service to the point where it is entirely practicable; experiments in fog-dispelling have been conducted; path-finding expeditions have covered practically the entire area of the United States, looking to the selection of the best possible aerial routes; a special aerial map, perfected through the coöperation of the Engineer Corps, and covering the established air routes, is now in daily use by civilian aeronauts as well as military fliers.

Photographs have been made through the country of unusual geological formations, of historical sites and of an almost unlimited category of subjects otherwise inaccessible. Great numbers of Air Service photographs are used throughout this country and abroad for educational purposes.

Services to Other Departments.—The Air Service prepares, and through the Government Printing Office, distributes to the public a series of Aeronautical Bulletins, which give photographs or topographical sketches together with other pertinent information such as prevalent wind direction, of every organized airdrome in the country as well as of hundreds of emergency landing fields.

Upon the establishment of the Air Mail Service the Air Service placed at the disposal of the Post Office Department all available information on the subject of airways, airdromes, equipment, landing lights, beacons and flares. Technical advice on the design of planes suitable for mail service was given, an experimental plane was sand-tested and another has recently been fully equipped at McCook Field for radio direction flying. The Air Service in coöperation with the Engineering Corps, with the Eastman Kodak Co., and the Fairchild Aerial Camera Corp., has developed the best known aerial cameras and has perfected the process of developing and printing to a remarkable degree.

Thousands of square miles have been photographed by the Air Service for the Engineer Corps and for the Geological Survey.

MILITARY AND NAVAL PENSIONS

By Winfield Scott

Commissioner, U. S. Bureau of Pensions

DISBURSEMENTS

The annual report of the Commissioner of Pensions to the Secretary of the Interior shows $217,150,612 paid out for pensions in the fiscal year of 1925, as compared with $229,994,777 during the fiscal year of 1924. The cost of maintenance and expense of the pension system in 1925 was $1,489,087.

The number of pensioners on the roll June 30, 1925, was 512,537 as against 525,539 on June 30, 1924. Of those on the roll 126,566 were Civil War veterans; 241,193, Civil War widows; 101,702, Spanish War veterans; and 18,363, Spanish War widows. There are yet seventeen soldiers of the Mexican War and twenty-one widows of soldiers of the War of 1812 in receipt of pension. On account of service in various Indian Wars, 3,924 soldiers and 3,034 widows were on the roll. For disabilities of service origin, 12,399 soldiers were in receipt of pension, and for deaths of soldiers due to service causes, 3,762 widows, minors, and dependent relatives were on the pension roll.

By classes at the close of the fiscal year there were on the pension roll 244,657 soldiers, 260,382 widows, 2,281 minor children, 883 helpless children, 4,105 dependent relatives, and 229 nurses.

The total disbursements to pensioners under the pension system, which dates from 1790, have been to the close of this fiscal year $7,053,502,010, of which $6,613,314,980 have been paid out on account of the Civil War, and $151,771,860 on account of the War with Spain. The total number of claims allowed under the pension system has been 6,566,454, of which 5,409,210 were claims of soldiers and 1,157,244 claims of widows, minor children, and dependent relatives of soldiers.

NUMBER OF PENSIONERS

The number of pension certificates issued during the past fiscal year was 64,193 of which 27,804 were for Civil War service and 34,075 for Spanish War service.

Of the 512,537 pensioners on the roll on June 30, 1925, there were 508,244 residing within the confines of the United States, 29 in the Canal Zone, 1,405 in our insular possessions, and 2,859 in foreign countries.

The net loss to the pension roll for the past fiscal year was 13,002. The roll of Civil War soldier pensioners was reduced by 20,182, and of Civil War widow pensioners by 11,943. These losses were largely offset by a gain of 16,664 to the Spanish War soldier roll and of 2,259 to the Spanish War widow roll.

During 1925, there were 163,571 claims before the bureau for action, of which 120,809 were disposed of, leaving 44,762 pending on June 30, 1925. Of the claims disposed of, 38,580 were based on Civil War service, and 59,031 on Spanish War service. In the past four years 526,361 claims for pensions have been disposed of.

The number of checks prepared and mailed in the past fiscal year was 6,429,998, carrying an aggregate of $226,634,205.14 in payment of pensions, annuities, refunds, and fees of examining surgeons.

CIVIL SERVICE PENSIONS

The Bureau of Pensions is charged with the administration of the act of May 22, 1920, providing for the retirement of persons within the classified civil service.

The Commissioner's report for the fiscal year of 1925 shows that there were before the bureau for action 41,598 claims of all classes under the Retirement Act. Of these 40,451 were disposed of, leaving 1,147 pending on June 30, 1925.

The civil service retirement and disability fund on June 30, 1924, amounted to $33,586,193.19. During the year the fund was increased by $17,905,070.98, deducted from the salaries of civil service employees, and by $2,123,796.71, interest, profits, and miscellaneous receipts. There were disbursed for annuities $6,235,830.16, and for refunds $2,713,452.16, a total of $8,949,282.32, leaving a surplus in the fund on June 30, 1925, of $44,665,778.56.

The number of annuitants on the roll, June 30, 1925, was 11,689 as against 10,548 on June 30, 1924. Of those on the roll, 9,741 have been retired for age and 1,948 for disability. The number dropped on account of death during the year was 893.

The work of the Retirement Division of the Bureau is practically current, claims being promptly disposed of upon receipt of the information necessary to their settlement.

Under the terms of the Retirement Act, 2½ per cent. has been deducted since August 1, 1920, from the salary of each employee to whom this act applies. The "civil service retirement and disability fund" has received from this source $73,907,481.21 and this sum has earned in interest and profits from investments $5,349,620.05, making the retirement fund total $79,257,101.26 to the close of the fiscal year of 1925. Out of this fund $23,671,103.08 have been disbursed for annuities and $10,920,219.62 in refunds to persons whose services with the Government have been terminated, making the total disbursements from the fund $34,591,322.70 to June 30, 1925. The retirement fund at the close of the fiscal year of 1925 amounts to $44,665,778.56.

EDUCATIONAL FEATURES

The chief functions of the Bureau of Pensions are the adjudication of claims and the payment of pensions granted under the laws providing pensions on account of military or naval service to the United States, and the administration of the laws making provision for the retirement of civil service employees. In addition the bureau maintains certain educational activities.

The large number of claims filed in the bureau made it necessary to evolve a scheme by which any one of them might readily be located. To meet this necessity a card record system was adopted believed to be as nearly perfect as can be established when dealing with records of such immense magnitude.

The method of disbursement of pensions, whereby approximately 600,000 checks are prepared, scheduled, pouched and mailed each month in time to reach their various destinations for delivery on the fourth day of the month, has been studied by those having to deal with disbursements on a large scale, or with mailing problems of great magnitude.

The files of the Pension Bureau, especially the Revolutionary War, War of 1812, and Mexican War files of claims have become a storehouse of historical data and are consulted by thousands engaged in historical and genealogical research work, either general or personal in character, the millions of claims based on Civil War service and the hundreds of printed volumes in the bureau library dealing with the Civil War yearly attracting students of history in steadily increasing numbers.

In the administration of the laws for the retirement of classified civil service employees much has come into the bureau as to retirement and annuity systems operated by municipalities, states, governments, and large corporations which is serviceable to students of social economy and public welfare.

UNITED STATES VETERANS' BUREAU

By Frank T. Hines
Brigadier General and Director of U. S. Veterans' Bureau

Relief Work Extended.—During the past year the system of relief for veterans of the World War has been characterized not only by increased activity in the adjudication of death and disability compensation claims, and in the hospitalization of veterans, but also in the field reorganization of the United States Veterans' Bureau. This increased activity was a direct result of the World War Veterans' Act of June 7, 1924, which consolidated, codified, revised, and reenacted the laws affecting the establishment of the United States Veterans' Bureau, and the administration of the War Risk Insurance Act, as amended, and the Vocational Rehabilitation Act, as amended; and through its liberalizing features admitted for benefits many thousands of cases not eligible for benefits under prior legislation, increased benefits for many others, and permitted the decentralization of case action from the fourteen district offices to fifty-four regional offices, these latter being established in each state with the exception of Delaware.

The relief activities conducted by the United States Veterans' Bureau during the past twelve months comprise: (a) the providing of hospitalization and out-patient medical care to disabled veterans; (b) the rehabilitation of disabled veterans who suffered a vocational handicap as a result of service; (c) the adjudication of claims for compensation filed by disabled veterans, or dependents of disabled veterans; (d) the maintenance of insurance records of all veterans who have applied for insurance and are maintaining premium payments thereon, and the adjudication of all claims filed by the insured or his, or her, dependents as a result of permanent total disability or death; and (e) the dispensing of benefits under the World War Adjusted Compensation Act.

Hospital Service.—Disabled veterans with any degree of disability resulting from service are given such medical, surgical and hospital care, and such supplies and appliances, as may be determined to be reasonably necessary and useful. All hospitals of the Bureau are also available for every honorably discharged veteran of the Spanish-American War, the Philippine Insurrection, the Boxer Rebellion, or the World War, suffering from neuropsychiatric or tubercular ailments and diseases, paralysis agitans, encephalitis lethargica or amœbic dysentery, or the loss of the sight of both eyes, regardless of whether such ailments or diseases are due to military service or otherwise. Hospitalization and necessary traveling expenses are authorized to be furnished to veterans of any war, military occupation or expedition since 1897 not dishonorably discharged, without regard to the nature or origin of their disabilities, in so far as existing Government facilities permit, preference being given to those unable to pay such expenses.

The following table shows the classification of patients of the U. S. Veterans' Bureau in all hospitals:

	In Government Hospitals	*Civil and State Hospitals*	*Total*
Tuberculosis	8,060	1,248	9,308
Neuro-psychiatric ...	9,878	2,643	12,521
General and Surgical	4,889	147	5,036
Total	22,827	4,038	26,865

The number of admissions to hospitals during the past twelve months was 69,185, and a total of 8,307,817 days of hospital relief have been furnished. The total number of treatments given to patients outside of hospitals was 1,154,537, and the examinations made numbered 1,036,124. Ninety-two Government hospitals are being utilized, in which the total number of beds available is 30,568. Of the above hospitals fifty-one, with a bed capacity of 20,800, are under the immediate jurisdiction of the Veterans' Bureau.

Hospital Construction.—Since January 1, 1925, two new Veterans' Hospitals have been completed, furnishing 520 beds for tuberculosis patients, and at the present time there are under construction two new hospitals which will furnish 325 beds for neuropsychiatric cases and 234 tuberculosis beds, these hospitals to be opened for the reception of patients on March 1, 1926. 159 additional beds for tuberculosis patients are being added to the Government plant at Hot Springs, South Dakota, and bids have been requested on a new 400 bed general hospital for Minnesota. To date there has been authorized for hospital construction a total of $64,595,000, under which authority $51,595,000 has been actually appropriated.

Vocational Training.—Vocationally handicapped veterans who served in the armed forces of the United States from April 6, 1917, to July 2, 1921, and who made application therefor before June 30, 1923, who deserved and were in need of retraining, have been or are being given vocational training. The number of trainees rehabilitated or who have completed a course of training is 114,029. During the past twelve months 22,339 veterans were rehabilitated or completed a course of training. Rehabilitated men are placed in gainful employment through the coöperation of service men's organizations, labor organizations, Chambers of Commerce, Rotary Clubs, and by contracting firms employing especially trained men. The total reported unemployed, on whom the Veterans' Bureau maintains a follow-up, on December 1, 1925, was 3,758. Because of legislative provisions no new trainees may be entered in training after June 30, 1925, and vocational training will not be continued to any one after June 30, 1926. The following table shows the number of trainees in training, by type of training, as of December 1.

	Agricultural	*Commercial*	*Professional*	*Trade and Industrial*	*Total*
Institutional	339	955	2,185	409	3,888
Placement	477	1,217	366	5,836	7,896
Project	2,246				2,246
Correspondence	41	311	90	229	671
Tutorial		3	39		42
Total	3,103	2,486	2,680	6,474	14,743

Claim Adjustment.—Compensation is awarded for death and disability resulting from personal injury received, or disease contracted, in the military or naval service on or after April 6, 1917, and before July 2, 1921, or for an aggravation or recurrence of a preëxisting disability incurred during or as a result of such military or naval service.

The number of claims for compensation received during the past twelve months was 40,399. The total of all compensation claims received was 1,014,810, of which only 10,363 have not been adjudicated. Of the total adjudicated there has been a total of 505,063 awards for death and disability. The number of claims on which payments were being made was 293,404, including 220,970 disability cases and 72,434 death cases. Frequent readjudications of claims are made because of appeals or the submission of additional evidence. The total number of adjudications made during the past twelve months was 507,277. Monthly disbursements for this purpose approximated $12,500,000.

Government Life Insurance.—This is granted to service and ex-service men applying therefor within the stipulated time. This insurance is issued in the following forms: Yearly Renewable Term Insurance and U. S. Government Life Insurance, which latter may be had in any of the following forms: Ordinary Life, 20-Payment Life, 30-Payment Life, 20-Year Endowment, 30-Year Endowment, and Endowment at age of 62. Under the present law all term insurance must be converted into some form of U. S. Government Life Insurance before July 2, 1926. The following statement indicates the number of men carrying government insurance and the amount of insurance in force:

	Number	*Amount*
U. S. Government Life Insurance:		
Ordinary Life..	69,217	$354,173,550.10
20-Payment Life	124,315	538,379,110.71
30-Payment Life	18,689	95,233,739.02
20-Year Endowment	106,324	302,414,702.03
30-Year Endowment	26,831	111,197,517.72
Endowment at Age of 62 ...	22,485	109,727,402.43
Extended Insurance	16,999	39,087,823.67
Total U. S. Government Life Ins.	384,860	$1,550,213,845.68
Yearly Renewable Term In- Insurance ...	162,851	1,265,754,520.00
Grand Total Insurance in Force.	547,711	$2,815,968,365.68

Any person in active service on or after April 6, 1917, and before November 11, 1918, who died or became permanently disabled without having applied for insurance is considered to have applied for and been granted insurance. The benefits of such insurance are payable in installments of $25.00 per month so long as the beneficiary remains permanently and totally disabled, or, if deceased, to his dependents for not more than 240 months. This form of benefit is known as automatic insurance.

The total number of claims awarded on account of Yearly Renewable Term and Automatic Insurance was 167,348, having a value at date of award of $1,454,979,753.08. During the past twelve months 4,664 awards, having a value of $31,287,413.31, have been made. A total of 6,819 awards, with a value of $29,316,331.53, have been made on U. S. Government Life Insurance claims, of which 1,582, amounting to $7,230,774.68, were made during the past twelve months.

World War Adjusted Compensation Act.—This act was passed by Congress May 19, 1924, and authorized the payment of adjusted compensation to all veterans below the rank of Captain in the Army and similar rank in the Navy, Marine Corps and Coast Guard. Applications were first received from the War and Navy Departments in September, 1924, and to date there have been adjudicated 3,003,826 applications, which are classified as follows:

	Army	*Navy*	*Marine Corps*	*Total*
Cash Payments:				
Veterans				
$50 or less..............	$ 92,069	$ 5,674	$ 347	$ 98,090
Dependents				
$50 or less..............	1,526	110	19	1,655
Over $50................	28,449	3,052	818	32,319
Total Cash Payments.........	$ 122,044	$ 8,836	$ 1,184	$ 132,064
Insurance Certificates.........	2,483,304	335,948	52,510	2,871,762
Total	2,605,348	344,784	53,694	3,003,826
Value of Certificates..........	$2,538,973,182	$368,588,465	$58,351,485	$2,965,913,132
Value of Cash Payments......	3,090,782	159,312	12,216	3,262,310
Value of Dependents' Awards..	10,485,013	1,297,151	338,446	12,120,610
Total	$2,552,548,977	$370,044,928	$58,702,147	$2,981,296,052

The total of all disbursements made by the Veterans' Bureau is $3,243,169,304.70. Those made during the past twelve months are classified thus:

Administrative	$ 43,448,129.64
Compensation	143,985,689.14
Insurance	128,017,255.78
Vocational Training	45,808,214.09
Medical and Hospital Services	29,701,852.79
Hospital Facilities and Services (construction)	3,648,643.79
Administrative Expenses, Adj. Comp. Act, 1924-25......	835,105.80
Adjusted Service Certificate Fund	10,917,809.00
Adjusted Service and Dependent Pay	5,218,452.72
Miscellaneous	23,975.13
Total	$411,605,127.88

SPECIAL FUNCTION OF THE UNITED STATES ARMY

By William Addleman Ganoe
Major U. S. A., Historical Division, Army War College

ENGINEERING SERVICE

Corps of Engineers, U. S. Army (Major General Harry Taylor, Chief).—Besides its military functions, the Corps is charged with important civil ones, embracing the improvement and maintenance of the navigation channels in ports, rivers, and other internal waterways, in so far as they are under improvement by the Federal Government, and with the administration of Federal laws for the protection and preservation of navigable waterways of the United States.

Territory.—For this purpose the country is divided territorially into 10 divisions, subdivided into 43 districts, each division and district under an engineer officer. The number of works in hand at the beginning of the fiscal year 1925 embraced the improvement of 199 harbors, 284 rivers and 53 canals and other waterways. With the exception of a few State or privately owned canals, of which the New York State Barge Canal is the most notable, the undertaking covered all navigable channels of the United States on which commerce moves. The total amount of money spent on our harbors and waterways has been slightly in excess of $1,300,000,000 and present expenditures for this purpose now amount to between 60 and 70 millions annually. The force under the Corps of Engineers, employed on this work, embraced some 25,000 to 30,000 employees, exclusive of the number employed by contractors. The work was done both by contract and by day labor, the day labor method being used only when it is cheaper than the former. The Department necessarily operated large numbers of dredges, snagboats, barges, and a considerable amount of construction plants.

Rivers.—Important construction work during the year included: the continuation of work on the Ohio River, which now provides 576 miles of canalized river out of a total length of 968 miles, and will be completed in 1928 or 1929; the work on Wilson Dam which progressed far enough to permit the delivery of hydroelectric power; the placing of over 27,000,000 yards of earth in the Mississippi River levee system; the dredging of more than 150,000,000 yards of material, which included nearly 1,000,000 yards of rock and coral, for the maintenance and improvement of the channels in our seaports and rivers; besides such work as breakwater construction, removal of snags, and much other miscellaneous work.

Waterways.—In connection with the administration of Federal laws for the protection and preservation of navigable waterways of the United States, plans and maps of location of 252 bridges were approved after examination concerning their effect upon the interests of navigation. Action was taken on 2,940 applications for permits for various classes of structures and operations in navigable waters. One hundred and twenty-one sunken vessels which were obstructions to navigation were removed. Rules and regulations governing the use and navigation of navigable waters were promulgated.

Officers of the Corps of Engineers are charged by the Secretary of War with the operation and maintenance of the Panama Canal; the improvement and maintenance of the water supply of the District of Columbia; the construction, maintenance, and care of public buildings and grounds in the District of Columbia; surveys and charts of the Great Lakes, and the preservation of Niagara Falls.

Alaska Board of Road Commissioners, composed of officers of the Corps of Engineers, lays out, constructs and maintains wagon roads and pack trails in Alaska. Up to June 30, 1925, it had constructed 6,465 miles of permanent trails, 1,472 miles of wagon road, 1,086 miles of sled road; $8,911,714.97 have been expended on this work.

Engineering Positions.—Officers of the Corps of Engineers are filling other important government positions, among which are: Governor of the Panama Canal; American members of the Joint Board of Engineers on the St. Lawrence River project; Consulting Engineers with the American St. Lawrence River Commission; Engineer Commissioner of the District of Columbia; Military Aide to the President; and Chief Engineer of the Federal Power Commission. [See Waterways and Harbors; Inland Waterway and Coastwise Commerce; and Foreign Commerce.]

MILITARY DUTIES OF ENGINEERS

These include surveying and map-making, procurement and supply of equipment and material for engineer work, training of engineering elements of the army, planning, construction and maintenance of fortifications and the development of engineer equipment. The Corps not only maintains an efficient surveying and map-making personnel available in a national emergency, but in so doing covers annually many square miles of country which would otherwise remain unmapped. The army engineer works where other Federal mapping agencies are unable to, largely along the strategic frontiers where funds for local coöperation in such matters are lacking. At the Engineer Reproduction Plant, Washington Barracks, D. C., maps of these areas are lithographed for general distribution. In the Relief Modeling Department of this Plant, as well as lithographic work, economical services are performed for many branches of the government. The Chief of Engineers must meet certain supply needs of all army branches, not only for normal times but national emergencies as well. In a crisis this equipment will run from high-power locomotives and gigantic cranes through to Swiss watches and thumb tacks. Five Engineer Depots are maintained in the United States and one each in Panama, Oahu and the Philippines. All Regular Engineer troops, consisting of three regiments, three battalions and three separate companies in the United States, with three regiments (less one battalion) abroad, conducted surveying, road and trail work, bridge building, general construction and repair, and innumerable other tasks. That their military efficiency has not fallen off is shown by the fact that in the National Rifle Matches at Camp Perry in the fall of 1924, they won the highest prize—the National Trophy, as well as three other important trophies. The Engineer School is located at Fort Humphreys, Va., on the old Fairfax estate, where the young George Washington got his first training as a surveyor and engineer. Courses of instruction are carried on there for Regular, National Guard and Reserve officers, and for selected enlisted men as for other branches.

Engineer Reserve Units.—Steady progress is being made in the organization and training of such units, especially in the Railway Battalions assigned to the principal railroad organizations of the country. With these Reserve units some 34 Regular Engineer officers are working in executive capacity, in addition to their other duties.

PROPERTY AND CLAIMS

War Claims.—Since the records of the former War Department Claims Board, the Board of Contracts Adjustment and the Board of Appraisers, which were the agencies created by the Secretary of War to adjust claims arising out of the suspension of war contracts at the close of the war, have come into the custody of the Judge Advocate General, a section of the Department prepared the data for use by the Department of Justice in the settling of such claims. One thousand one hundred and eleven suits have been filed in the Court of Claims and in the United States District Court involving more than $26,000,000, most of which arose out of war-time conditions. In addition to this class of cases twenty-four admiralty suits involving $655,000 have been filed and are being handled in this Department, with great saving to the government.

Another section prepared legal opinions, on claims of various character, both for and against the War Department. For the four-year period ending 1925, legal opinions were expressed on approximately 4,000 such claims, varying in amount from a few dollars to several million dollars each, most of these claims being for violations or breaches of ordinary peace-time War Department contracts.

Real Estate.—Another section of the Department is charged with legal supervision over the real property under the control of the Secretary of War: 1,500,000 acres of land scattered in practically every state in the Union. Questions of title, leases, licenses, rentals, easements, federal jurisdiction, taxation, riparian rights and numerous similar questions have constantly arisen to furnish this section with knotty problems which must be settled from the standpoint of the government of the United States.

Patents.—The patents section of the Department has obtained patents upon inventions submitted by War Department personnel, has handled all such proceedings in the Patent Office, has drawn contracts involving patent rights and licenses, and has advised the War Department in the administrative handling of all matters involving the patent laws. Among the matters it is handling administratively may be mentioned the arbitration of patent royalties upon the government's vast investment at Muscle Shoals, in which case it has been acting as counsel for the United States. Its primary function, however, is preparing the government's defense in all patent actions brought in the Court of Claims and United States District Courts where the War Department is involved, the evidence prepared being turned over to the Department of Justice for presentation to the court. Judgments against the United States have been obtained by claimants in eleven cases only, the aggregate amount being approximately $800,000.00. At present the section is preparing the defense in 60 court cases, still pending, which involve claims aggregating approximately $650,000,000.00. One hundred and fifty court cases involving over $600,000,000.00 have already been successfully defended, the saving to the government being apparent.

QUARTERMASTER CORPS

This army department store (under Major General W. H. Mart, Quartermaster General) furnishes subsistence, food, clothing, shelter and transportation to the soldier. It handles under the head of subsistence 175 items; under clothing, everything that the soldier wears, from the furs of Alaska to the white of the tropics; under shelter, barracks, quarters, tentage and storage space; under transportation, movements by rail, water, motor and animal, the last sub-division including dog teams of the Alaskan north and the carabao of the Philippines. During the fiscal year ending June 30, 1925, appropriations for quartermaster purposes amounted to $74,059,152.54, leaving at the end an unexpended balance of $2,171,526.04 and an approximate net saving of $224,579.95. Both for peace-time purposes and for readiness for any emergency the Quartermaster Corps carried on during the year a continuing investigation of the material resources and manufacturing facilities of the country. The "Quartermaster Winter Plattsburg" training exercises in Quartermaster and logistical work similar in general outline to the original Plattsburg movement, rose to the number of 32 throughout the country, with approximately 4,000 Regular Army, National Guard and Reserve officers participating in the problem. By closing certain motor transport plants and general sales stores, and by other changes as in the transport service, the Quartermaster General made decided savings for the government. For the ocean-going transports plying between New York, Porto Rico and the Canal Zone, between the east and west coasts, and between San Francisco, Honolulu, China and the Philippines, there was a total cost of $3,581,241.92. Had the same business been done by commercial lines, the cost would have been $7,011,954.85, the saving thus being $3,430,712.93. The average cost of a ration for the fiscal year 1925 was $.3094 as compared with $.3165 for 1924. Laundry service was furnished the enlisted man at an average cost of $1.75 per month per man. The Corps, in addition to its military duties, operated 84 national cemeteries throughout the country, 5 large national parks, maintained 8 large cemeteries in Europe, finished the return in 1925 of 46,300 bodies from France and recovered, since January 1, 1925, the remains of 73 American soldiers from isolated graves.

SERVICE TO THE COMMUNITY

On March 18, 1925, areas in Illinois, Indiana, Missouri and Kentucky were made homeless by a tornado which swept that part of the country. Adjutant General C. E. Black of Illinois called on the Commanding Officer of the Chicago Quartermaster Intermediate Depot, Colonel Clyffard Game, for aid in the emergency. As in many previous calamities of flood, fire and the like, the Quartermaster Corps came to the rescue by supplying 1,000 tents, 4,000 beds, 4,000 pillows, 4,000 pack sacks and 12,000 blankets to the stricken district. It sent 500 tents a few days later. This prompt action on the part of the Quartermaster Corps was the subject of a letter of appreciation from Governor Small of Illinois. The St. Louis and Jeffersonville Depots of the Quartermaster Corps also rendered assistance in this emergency, although on not such a large scale as the Chicago Depot.

Bureau of Insular Affairs (Major General Frank McIntyre, Chief) concerned itself particularly during the year with the Philippines, Porto Rico, Haiti and Santo Domingo. In the Philippines the progress has been orderly. The total of imports and exports for the calendar year 1924 amounted to $243,000,000. During the sugar year, 1924-25, owing to the comparatively recent construction of modern sugar mills, the estimated production of centrifugal sugar was 483,000 metric tons.

Porto Rican Service.—The Chief of the Bureau, in his visit to Porto Rico in the month of August, 1925, his first visit since 1920, noted material progress in every field of governmental and private activity, the most noticeable being the erection of necessary public buildings and the extension of the splendid highway system. The serious problem of excess population, to a slight extent, is being met by the gradual development of small industries. In Haiti, which was visited at the same time, a marked element of the present prosperity is due to the funds brought back by Haitian laborers returning from Cuba and Santo Domingo. However, one crop produced in Haiti brings as much money into the Republic as do these returning laborers.

Dominican Receivership.—At the request of the Department of State, the Bureau organized a personnel that went to Santo Domingo for the purpose of administering the receivership of the island. The work met with an unprecedented absence of friction, and the Dominican Republic received the advantages flowing from the adjustment of its indebtedness, which had been the source of controversy with foreign governments, with its own citizens, and with foreign residents of the Republic. Its customs service was promptly reformed and placed on an efficient basis. Smuggling, hitherto rife, was promptly suppressed. The financial success of the receivership was such that in 1920 a revision of the tariff was made materially reducing duties and practically abolishing the export tax. Notwithstanding the reform and reduction in the tariff, the success of the receivership has so far exceeded anticipations that it almost accomplished in 1925 what had been planned for the 50 years of its contemplated existence.

Panama Canal, while not a part of the War Department, is under the personal supervision of the Secretary of War. Its Governor is appointed by the President, by and with the consent of the Senate, the present incumbent being Colonel Meriwether L. Walker, Engineer Corps, U. S. Army.

From the opening of the Canal to commerce on August 15, 1914, up to June 30, 1925, a total of 29,705 commercial vessels have been transited with a total Panama Canal net tonnage of 123,675,548. These vessels carried 131,869,827 long tons of cargo, and paid $119,203,341.97 in tolls. The total transit revenues of the Canal to above mentioned date, including tolls, taxes, licenses, fees, postal receipts, etc., amounted to $121,327,975.46. The net expenses totaled $78,086,461.05, leaving a net surplus of $43,241,514.41. In addition, the business operations of the Canal, comprising the furnishing of various services and supplies to outside interests, mainly to shipping, showed a net surplus of revenues over expenses amounting to $4,231,752.17.

The Panama Canal did less business during the fiscal year 1925 than during 1924, a record year. The number of commercial vessels in transit declined from 5,230 to 4,673, and the revenue from tolls fell from $24,289,603.16 to $21,374,664.12. This decline, which was anticipated, was due entirely to the slump in oil shipments from California. With oil excluded, however, the 1925 traffic showed a normal growth over 1924. The net revenues from Canal transit operations in 1925 was $13,465,924.72, and from Canal business operations the net revenue amounted to $765,916.85, as compared with $16,307,948.50 and $901,624.12 respectively for 1924.

MILITIA

Militia Bureau (Major General Creed C. Hammond, Chief), during 1925, handled the National Guard with a progressive development in all branches, especially in the routine administration of that component of the army. A school for state adjutants general was held from March 5-10, 1925; all adjutants general or representatives from practically every state, the officers in charge of National Guard affairs at corps-area headquarters and the senior instructors on duty with the National Guard were present. The mutual understanding of problems effected by personal contact resulted in added coöperation.

Militia Service.—Available National Guard troops were utilized in 15 states during the year to render aid in disaster and to assist civil authorities. That the system of promotion in the National Guard is well observed, is demonstrated by the fact that 3,520 cases of recognition in grades higher than 2nd lieutenant were acted upon during the year, 1,320 being by promotion. The loss in commissioned personnel continued to be large although no specific reason for this year's high rate is apparent. Of 10,898 officers on June 30, 2,338 are no longer on the active list, new officers taking their places. This turnover of 22 per cent. is not regarded as a loss, for, whereas the efficiency of the National Guard itself suffers, the training, no matter how elementary, is expended in wider degree upon the nation. On June 30, 1925, 6,256 officers in the National Guard held commissions also in the Organized Reserve, an increase of 554 over the previous year. The rapid growth of the National Guard during the fiscal year 1924, which on June 30 of that year reached a strength in excess of 177,000, made necessary the adoption by the War Department of a suspension policy in order to avoid a deficit in Militia Bureau funds. In spite of the restriction, the strength of the National Guard increased, reaching a peak of 189,722, September 30, 1924. From that date the strength decreased until May, 1925, when it was approximately 176,900. The training situation shows that the Air Service is the most advanced and Infantry the most backward in the National Guard. The slowness of the latter is due to the difficulty of bringing troops to the standard considered satisfactory. Its many phases of duty, its numerous weapons, its niceties of adjustment in the combination of personnel and weapons, its difficulties in the development of the leadership and initiative demanded of the lower grades, cause properly balanced teamwork to be beset with many obstacles. The staff of the commanding general of each corps area and the Hawaiian Department is provided with an officer in charge of National Guard affairs. During the fiscal year 1925, 276 officers and 65 enlisted men of the National Guard attended courses at the special service schools of the Regular Army.

CIVILIAN PERSONNEL DIVISION

This division, under direction of Assistant and Chief Clerk, J. C. Scofield, exercised administrative control in matters pertaining to civilian employees of the War Department and with the army. This task involved the administration of the Civil Service Law and Rules, the Reclassification Act, the Retirement Act, the Eight Hour Law, and the Employees' Compensation Act. This division also handled matters affecting the regrading of salaries and wages. The number of civilian employees affected by the foregoing laws in the Department and its field services at this time is 49,117. During the World War this force reached a strength of 251,624.

OFFICERS DETAILED TO CIVIL INSTITUTIONS

Seventy-one officers attended 1924-1925 courses at civil institutions in the United States. They were distributed among the various branches as follows:

Infantry	7	I. G. Dept.	1
Field Artillery	7	Ordnance	7
Coast Artillery	4	Med. Corps	8
Air Service	10	Q. M. C.	8
Engineers	8	Chem. W. Service	4
Signal Corps	5	Finance	1
A. G. Dept.	1		

OFFICERS ATTENDING FOREIGN SCHOOLS

There are now eleven officers attending foreign schools. They are distributed among the various branches as follows:

Infantry	3	Q. M. C.	2
Field Artillery	1	Air Service	1
Coast Artillery	1	Engineers	1
Cavalry	2		

The figures show a grand total of students in attendance at General and Special Service Schools (including Schools for Bakers and Cooks) for the school year 1924-1925, as follows:

	Officers	Enlisted	Cadets
Regular Army (including Warrant officers)	1,354	1,837	..

ORGANIZATION OF THE UNITED STATES NAVY

By W. L. Rodgers

Rear-Admiral, U. S. N.

MEN AND MATERIAL

Force.—On June 30, 1925, the Navy of the United States had 8,389 commissioned and warrant officers and 84,289 enlisted men on active duty. In addition the Marine Corps (a part of the Naval establishment) had 1,170 officers and 18,310 enlisted men. Besides, there were enrolled reserves in an inactive status, but available for war and subject to short drill periods, amounting to 3,818 officers and 24,457 men for the Navy, and 151 officers and 483 men for the Marines.

Shipping.—On approximately the same date (May 1) the Navy had 2,295,882 tons of serviceable shipping of all classes and about 100,000 tons more under construction. The investment cost of this tonnage was about $1,400,000,000 and the replacement cost of the older part would be 80 per cent. greater. In addition the naval establishment owned or controlled 875 shore properties of a value of about $600,000,000 used for naval stations, dry docks, fuel stations, target ranges, radio stations, hospitals, store houses, factories, offices, etc., all as shore bases for the operation of the fleet. Further, the Navy had on hand about $800,000,000 worth of stores and munitions for the equipment and supply of the fleet. Of the aggregate tonnage of the fleet about 500,000 tons is in eighteen battle ships, and over 900,000 tons in auxiliary ships, most of which are armed and capable of fighting both in law and in fact, although not primarily intended for that purpose.

Appropriations.—For the maintenance and operation of the Navy, Congress appropriated $299,708,327 for the fiscal year ending 1925, and $319,783,978 for the fiscal year ending 1926.

Of these sums about 45 per cent. goes for personnel (pay, subsistence and allowances) and about as much for maintenance and operation of ships and other material. The remainder, about 11 per cent., was devoted to new ship construction.

The shipping of the Navy having been much augmented during the war, the ship replacement charges are at present very low. Normally they cannot be expected to run under 80 to 100 million dollars a year.

LIMITATIONS OF ARMAMENT

Question of Limitation.—As the result of the war, after its close, the Navy was pursuing a policy of expansion such as it had pleased Congress to establish, and this was making the U. S. Navy the most powerful in existence, and other nations were very jealous thereat. In the summer of 1921, in the hope of the promotion of international good will, the President called a conference of the great naval powers and some others for the settlement of disputes as to policies of the Pacific and subsequent thereto the limitation of armaments. The powers invited hastened to accept, for they saw an opportunity of limiting the naval predominance of this country.

The American proposal was for the limitation of all classes of ships, but this did not at all please the other powers and the outcome early in 1922 was a treaty requiring the United States to surrender and scrap her superiority in battle ships and limiting that class of ships and large airplane carriers, while leaving all powers free to expand their navies in all other classes of ships as they please. The treaty limits the size of individual battle ships to 35,000 tons and their aggregate tonnage to 525,000 tons for the United States, with guns no larger than 16-inch. Aircraft carriers for the United States are not to aggregate more than 135,000 tons and the ratio for the five powers signing this treaty are 5-5-3-1.67-1.67 for the United States, England, Japan, France and Italy, respectively.

The cruisers of any signing nation may be of any aggregate tonnage, but individually may not be larger than 10,000 tons, or carry guns larger than 8 inches.

By this treaty the Navy of the United States is bound at least until 1936, unless one of the parties goes to war when it becomes possible, not obligatory, temporarily to suspend the stipulations of the treaty.

Limitations Effective.—In February, 1925, the treaty for limitation of naval armaments became completely effective when the powers concerned exchanged notifications that all ships condemned by the treaty had been scrapped. It is to be noted that the treaty has stopped competition only in the very largest ships for building which the wealth of the United States gave her an advantage.

In all else, in strength of personnel, numbers of cruisers and size and numbers of all other classes of ships and in naval aviation service competition is still unlimited; and in fact in size and training and efficiency of personnel, in alterations and improvements of existing ships (within certain wide treaty limits as to battleships) every navy is striving to outdo others as well as the size of its budget permits.

Policy of Navy Department.—Upon the signature of the treaty, the Navy Department formulated a policy in conformity with the treaty for its subsequent guidance, which has been approved by the President and is in force so far as the Bureau of the Budget and Congressional appropriations permit.

This statement of policy lays down as fundamental that, "The Navy of the United States should be maintained in sufficient strength to support its policies and its commerce, and to guard its continental and overseas possessions." The statement of proper strength follows: "To create, maintain and operate a navy second to none and in conformity with the ratios for capital ships established by the treaty." And further: "To make the capital ship ratios the basis of building effort" and "To maintain an active personnel afloat in conformity with the ratio for capital ships." And, "To direct the principal part of the air effort on that part of the air service which is to operate from ships of the fleet." Lastly, "To give the public all information not incompatible with military secrecy."

It will be seen that this policy abandons all competition to exceed other powers in strength, but retains the right to develop the highest efficiency in existing forces.

The financial limitations placed by the Budget office have prevented the full execution of this policy. As Departmental tables show, the maintenance of treaty ratios calls for several thousand more men; over 200,000 tons in additional cruisers, and 40,000 tons in submarines.

On the other hand the war left the United States with 350,000 tons of destroyers, an excess over the treaty ratio, so that none are proposed just now.

FINANCE

Budget.—In the development of the Navy, the Bureau of the Budget is a new influence deserving of note.

The Budget office has done much to cut national expenditures and the efforts of the Navy Department to meet its demands have led to great increase of economy with as yet little, if any, loss of efficiency.

Nevertheless, the ultimate objectives of the two departments are not identical nor are they completely reconcilable.

The principal objective of the Budget each year is to cut expenses for the current year and somewhat neglect contingencies visible only in the future. Departmental efficiency is not the primary aim of the Budget. On the other hand, departmental efficiency is the primary duty of the Navy. It must maintain present efficiency and also look into the future, preparing each year for emergencies that may not arrive till next year or later. So far the Budget has held the whip hand; but if the Navy is to remain a main reliance of the people as it has been in the past, it will soon be necessary for the Budget to be more liberal.

Material and Research.—The history of naval management during the calendar year 1925 may be divided into two sections and first that of material. The great spending Bureaus have maintained the fleet in efficiency and in addition have engaged in scientific research, to promote warlike efficiency and financial economy.

Among the principal efforts in this direction are modernization of several battleships, improvements in auxiliary machinery, improved types of engines in submarines, including electric drive, improvements in radio communication and in underwater sound communications for direction and distance and in the self-maintenance of ships afloat without aid from repair shops. The research laboratories have improved materials and increased economy in oil fuels. In ordnance there has been development particularly in anti-aircraft guns and accessories for sighting them and increasing their effectiveness.

The air research work of the Navy is also important and the flying machines turned out at the naval factory are better every year. So long as this rapid improvement continues, it is inexpedient to attempt to establish large reserves of war stocks lest they become obsolete before service.

The appropriation for air service for 1925 was $15,150,000 which does not include personnel whose expenses are charged against general naval account.

TRAINING

Scientific Institutions.—Among the auxiliary scientific work of the Navy is the maintenance of the Naval Observatory and of the Hydrographic Office. Both do work fundamentally necessary for seamen. There is a permanent desire on the part of other departments of government to deprive the Navy of these offices under the plea of scientific and economic centralization. But as their work is for seamen and is directly subject to the professional criticism of their brother mariners among the officers of the Navy at sea, it is probable that removal to another department would tend to render them somewhat slow to meet the general demands of commerce and navigation.

Efficiency.—In operation it is the object of the Navy to prepare itself for war by being efficient at all times. For this purpose the Department is maintaining a high standard of recruiting and offers its men opportunities for scholastic and trade training while pursuing their military duties.

For officers, as well as men, there are technical and military courses to fit them for administrative duties in peace and war and for sound military leadership in war.

Fleet Training.—In fleet training the fleet has carried out its usual fleet exercises and target practice and battle manœuvres. The efficiency of the fleet is rising. In pursuance of this purpose it has held general exercises in the Caribbean and in the Pacific upon war-themes and later made a voyage to New Zealand and Australia upon the invitation of those dominions, where it was warmly welcomed and did much to improve cordial relations.

Certain elements of pacifistic opinion in this country opposed the movements in the Pacific as likely to give offense to Japan. But Japan raised no protest nor could she properly have done so in view of the fact that only a few weeks previously she had held fleet manœuvres whose theme was the advance of a hostile fleet westward across the Pacific. Indeed, such manœuvres are normal and so regarded by all powers. The right of the United States to send its fleet to any part of its own territorial waters and wherever else it is welcome must remain unquestioned.

FUNCTION

Protection of American Interests—There have been disturbances and unrest in various parts of the world, chiefly in China and in Syria, where U. S. Naval forces have been sent for the protection of missionaries and other United States interests and their presence has had a stabilizing effect.

It may be said in this connection that although the churches are apt in general to oppose the employment of military and naval force, yet the constant demands of missionaries for naval protection in China at every disorder have been the chief inducement, although not the only one, for the Navy to ask and obtain from Congress a flotilla of river gun boats for employment in those waters.

Navy in Haiti.—In the early part of the fiscal year 1925 the marine forces which have long secured order and good government in San Domingo and Nicaragua were withdrawn, but in Haiti a marine brigade is still retained; where, in the words of the Commandant, "It is the remains of the original force of occupation which brought to Haiti peace and tranquillity."

The immediate task of maintaining peace and order has been performed by the "Gendarmerie d'Haiti," which is composed of Haitian troops commanded by officers most of whom are officers and men of the marine corps.

Casualties.—The operations of the Navy have been carried on at the expense of some casualties, chiefly in submarine and air service. A certain number of such casualties is inseparable from efficient service, for risks must be run; but when very frequent it is possible to allege that they are the result of maladministration and inefficiency. Indeed, such charges have been current this year, chiefly in regard to the air service and its management. In September the submarine S-51 was lost with almost all on board as the result of a surface collision with a steamer. The accident was in no way due to submarine service. [It is understood that the Navy Department will probably take action for criminal negligence against the captain of the steamer.] The loss of the dirigible U. S. S. Shenandoah, in September, with regretable loss of life and unfavorable press comment, led the President to appoint a special Board of distinguished citizens to inquire into the conduct of the air service both of Army and Navy, and of civil departments and their relations to the national defense. The special Board finds the present organization and administration of naval aviation substantially sound and recommends minor changes only. However, in regard to the Shenandoah, the public belief is much in error as to the airworthiness of even the best of this type of craft. In the design of all aircraft, lightness is essential and is opposed to strength and reliability. In the case of the Shenandoah her design was necessarily fragile, because if she had been amply strong she would have been too heavy to rise in the air. The risk of crashing was the condition of service. The Court learned that she was designed to meet vertical currents of air of about ten feet a second, and to do this she had a factor of safety not above two; whereas, the ordinary engineering factor of safety is four to five. Experience had led the designers to think this assumption as to vertical currents sufficient, but they now believe that at the time of her loss the Shenandoah met far greater vertical currents, causing strains much beyond her strength. There is no reason for believing the Shenandoah was in any way mishandled. She was only unfortunate in meeting a gale of wind beyond her strength.

The Court of Inquiry recommends continuing the development of this type of air-craft and denies sensational stories of neglect and mismanagement.

AIR

Independent Air Service.—As for the general result of the investigation of the relations of the War and Navy Departments to their air services, the Special Board's belief and other weighty opinions already given the public are to the effect that an independent air service as a third arm of defense is undesirable. The public is misled by the romance of the new vehicle, for the flying machine is not a weapon but a vehicle merely. It is subordinate to the land service and the sea service because it can find its objectives only where they find theirs and cannot act without their support and need the shelters they provide, for fliers must alight at intervals of a very few hours.

Some members of the air service make vehement demand for freedom from control by non-fliers, alleging the latter are incapable of understanding the needs of fliers and the propriety of their demands. In individual cases of mismanagement cited privately to this writer as illustrative, it was clear that the errors named were due to the general unfitness of these particular superior officers to exercise authority. Each would probably have mishandled his own particular arm in the Army or Navy in the same way.

Air as Auxiliary.—In general, commanding officers cannot fail to be most anxious to make the best they can of the air forces under their command, and will listen to the air representative just as a cavalry officer listens to the advice of his veterinary, for the air service is a very important auxiliary. But the right and the duty of the commanding officer to make the ultimate decision and perhaps to call for sacrifice of life has been and must remain untouched as regards the air service as well as all other special branches and service corps of Army and Navy. The demand of the younger fliers for freedom from control of non-fliers is in great measure the usual demand of youth in all times and in all walks of life for freedom from restraint and from sound discipline, and the public should not take it as wholly in the interest of national welfare and efficiency, any more than it should accept the extreme technical claims of the air service that it will predominate in the wars of the future.

In the last war from first to last the Allied armies alone had large numbers of airplanes in service with their ground attendants of about ten men per plane. This enormous force of men and machines was helpful, but it did not decide the war. At the present moment there is no reason to believe that there is any probability of the air service supplanting or even rivaling the surface fleets of any navy in the world, although it is a very necessary auxiliary.

It should be recognized by the public that in all countries of the worl it may be surmised that the agitatio for larger aviation services is in considerable part maintained by th aviation manufacturing industry a an advertisement for the advancemen of the industry and as publicity material even more than for the defens of the nation.

NAVAL SHIP CONSTRUCTION

By Peter Bain

Editor, "Shipping Illustrated"

Navy Board's 1925 Program.—On January 17, a special Board consisting of seven Admirals and the Commandant of the Marine Corps, appointed by Secretary of the Navy Wilbur, made its report on the Department's immediate requirements, recommending among others the following seven items:—

That the six coalburning battleships, *New York, Texas, Wyoming, Arkansas, Utah* and *Florida*, be modernized, as authorized by Congress, without delay.

That the seven battleships, *New Mexico, Mississippi, Idaho, Pennsylvania, Arizona, Oklahoma* and *Nevada* be modernized as allowed by the Disarmament Treaty and as soon as possible.

That the eight 10,000-ton cruisers, already authorized by Congress, be built without delay.

That the three remaining fleet submarines, already authorized by Congress, be laid down during the fiscal year 1927.

That a progressive and adequate airplane-building program be authorized to ensure to the fleet a complete outfit of up-to-date planes, with 50 per cent. replacements in reserve, as well as the necessary training planes, at a total expenditure for the first year of $20,000,000.

That the completion of the aircraft carriers *Lexington* and *Saratoga* be expedited.

That an aircraft carrier of about 23,000 tons be authorized and laid down without unnecessary delay.

$240,000,000 Program.—The carrying out of this program in its entirety would have required an expenditure of about $80,000,000 a year for three years. Feeling that an expenditure o that magnitude was hardly warranted then as now, President Coolidge requested a further report which would show first, the relative priorities of the seven items above set out and second, the order of priority which the Special Board would recommend under several scales of annual expenditure materially less than that required for the complete program. On January 31, the Special Board presented a supplementary report in which it recommended an amended order of priority, if all seven items were to be included. After consideration of the original and supplemental reports, the President forwarded to Congress estimates for appropriations which included modernization of three of the coalburning battleships; continuation of the construction of the two airplane carriers; three million dollars for airplanes for the carriers, this being additional to one million for the like purpose included in the 1926 budget; laying down and commencing the construction of two 10,000-ton cruisers; commencing the construction of gunboats for patrol service on the Yangtse River.

Effects of the Disarmament Agreement.—In pursuance of the Limitation of Arms Agreement, 80 "capital" ships, 28 of which belonged to us, were scrapped. Of our new ships then building, the Colorado and West Virginia were completed, while the *Saratoga* and *Lexington*, originally laid down as battle cruisers, were, in accordance with the Agreement, converted into airplane carriers. The *Saratoga,* launched by the New York Shipbuilding Corporation, Camden, N. J., in April, 1925, is concrete evidence of the effect of the Agreement limiting naval armament, also evidence of fact that at the Conference the question of aircraft was under consideration, and that one of the methods adopted for limiting their effect on trans-oceanic warfare was by limiting the size and number of aircraft carriers.

Under the terms of the Agreement we were authorized to complete the *Saratoga* and *Lexington* as aircraft carriers, each to have a displacement of 33,000 tons and, in addition, to complete aircraft carriers having a total of 69,000 tons, or a total displacement of 135,000 tons of aircraft carriers of over 10,000 tons each. The *Saratoga* and the *Lexington* will each carry 72 planes, of which 31 will be bombing type, and the total cost of each vessel fully equipped will be about $45,000,000. Their designed speed is 33.9 knots, realised from 180,000 horsepower developed, and exerted through four propeller shafts. The *Saratoga* is expected to be completed in 1926. The *Lexington* was launched in October last from the plant of the Bethlehem Shipbuilding Corporation, Quincy, Mass.

The *Saratoga* and the *Lexington* have the distinction of being the longest naval vessels in the world, besides being also the highest powered craft, whether naval or mercantile. They are each 888 ft. long over all 850 ft. long between perpendiculars, 106 ft. beam and 74 ft. deep. In conversion to airplane carriers, the hulls below the waterline were left unchanged as far as possible, so as to retain substantial protection against submarine attack. Above the waterline, however, the vessels present a somewhat unusual appearance, the bows in particular being much flared out so as to secure the greatest deck width possible throughout the greatest length. A rather interesting feature is the recesses in the hull sides, between decks, for lifeboat stowage. The airplanes are stored below and are raised to the flying deck by specially designed elevators, one of which is only surpassed in size and capacity by the elevator that raises the stage at the Hippodrome, New York.

Navy Yards Seek Merchant Ship Reconditioning.—Early in 1925 a widespread controversy arose relative to Navy Yard participation as bidders for merchant ship repairing and reconditioning. Our privately owned plants, still smarting under the loss of big and new warship construction, and being hard hit at the same time by the generally overbuilt situation everywhere, were in no mood to receive further hard knocks, and certainly not this one which they considered the unkindest cut of all. They therefore lined up strongly in defence of what they considered their special rights and privileges. The controversy arose through the insertion of an amendment to the Shipping Board Appropriation Bill in Congress, which had for its objective the giving of precedence to Navy Yards in securing contracts for repairing and reconditioning merchant ships. In a word, the amendment, if passed, would have made it compulsory for the Shipping Board to award repair and reconditioning contracts to Navy Yards when their estimates of cost were lower than the bids submitted by private firms. The latter charged that the Navy Yards at New York, Boston, and Mare Island, which in the past had received Government contracts for work on Shipping Board vessels, had invariably exceeded their original estimates, thereby costing the Government larger outlays than would have been necessary had the work been done by private firms.

A few of the high lights exhibited on behalf of the private yards were that Navy Yards could not bid a firm price; that the department letting the contract has no guaranty or protection either as to the final cost or the time the job will actually take; that cost charged to the work is not the true or commercial cost, as it includes less than half the industrial overhead, the remainder not being charged but paid out of naval appropriations; that necessary work on naval vessels takes precedence over work for other departments, so that there can be no assurance of prompt or economical service.

Arguments for Federal Service.—Of course it was not at all difficult to analyze the underlying reasons that had encouraged governmental interference with private business of this kind. Fundamentally, Government employees in shipyards receive better wages and enjoy probably easier working conditions than their fellows in private shipyards. Again, the natural human instinct is to seek to continue in Government employ and to enlarge that particular field for other employees. Hence, they have been organized in such strong combinations as to bring political pressure to bear on the representatives in Congress to aid and abet Navy Yard work wherever and whenever possible. This political pressure, added to the natural propensities of certain radical elements heretofore in Congress and in high executive positions, has resulted in the expenditure of a great deal of money in the building up of Navy Yard ship-construction facilities, and in an enormous armor-plate plant, all of which are now worth little more than scrap value. In the very nature of things, the building and repairing of ships always have, and always will, cost much more in Government plants than they do under properly regulated private auspices.

Again, it is claimed that not alone should there be no more merchant ship repairs made in Navy Yards, but serious consideration should be given to having a goodly percentage of repairs to naval vessels made under competitive conditions, in our privately owned shipbuilding and ship-repair plants. The Government would save much money by so doing, and this additional work in these days of shipbuilding depression would go far towards saving some of the already sorely tried private establishments. The Navy is maintained largely to protect and support the American Merchant Marine; therefore, by helping to save some of the private shipyards from disintegration, it would at least be carrying out part of its mission.

The private shipbuilding and ship-repair yards won out, the presentation of their case being unassailable from every standpoint. That there has been an insistent and growing tendency towards Government interference and encroachment in private business generally, and that it was resented, was proven at the thoroughly representative and highly successful Conference of Protest, if we might so term it, held in Washington, D. C., in December last. Practically every trade and industry in the country were there and, naturally, private shipyard interests were to be found standing shoulder to shoulder with the others in the fight for freedom from Government participation.

NEW VESSEL COMMISSIONINGS

Ship Memphis.—During 1925, the U. S. S. *Memphis*, probably the speediest of Uncle Sam's new scout cruisers, was delivered by her builders, the Wm. Cramp & Sons Ship & Engine Building Co., to the Navy Department, being the fifth and last constructed by that firm of a fleet of ten turned out in the near past by different American private shipyards. On her trial trip, the *Memphis* maintained an average speed of 34.53 knots during a four-hour full-power spin at sea. A sister vessel, the *Marblehead*, by the same builders, reached 35 knots some time after being commissioned.

Destroyers.—Two new destroyer tenders received into United States naval service—the *Dobbin* and the *Whitney*—drew much favorable comment on account of their general design and layout, and of the completeness of their equipment to meet all ordinary needs of service—supplies and repairs for a group of 18 destroyers throughout a period of 60 days under war conditions. Their construction was authorized in 1918 but was delayed in order that the lessons of the European War might be applied. The *Dobbin* was assigned for construction to the Philadelphia Navy Yard and the *Whitney* to the Boston Navy Yard. Much of the equipment, such as pumps, machine tools, etc., was furnished from stock.

from ships scrapped under the provisions of the Washington Arms Conference. The *Dobbin* and *Whitney* are each 483 ft. 9½ inches long over all; 460 ft. between perpendiculars; 60 ft. 10⅛ inches molded and 60 ft. 11⅝ inches extreme beam, with an extreme draft of 22 ft. 3½ inches, and a displacement of 10,600 tons. The personnel for each comprises a force commander and 7 staff officers, a commanding officer and 29 officers, and 416 enlisted men. Twenty-four boats are carried with a capacity of 1024 persons. The battery consists of eight 5-inch, 51 caliber rifles, and four 3-inch anti-aircraft guns. The main propelling machinery consists of a high and low pressure Parsons-type turbine operating through single reduction gearing, with the astern units of the impulse wheel type. Steam is provided by two Bureau of Engineering express-type boilers burning fuel oil and designed for a working pressure of 215 pounds per sq. inch. The oil burners are of Babcock & Wilcox-Lodi type.

Submarines.—Fleet submarines authorized for construction by the last Congress were laid down at the Portsmouth, N. H., and the Mare Island, Cal., Navy Yards. Two 10,000-ton light cruisers authorized were also ordered laid down, one to be built at the New York Navy Yard, and the other by a private shipyard. Engines for the submarines and for six new river gunboats were ordered built by the New York Navy Yard, the gunboat hulls to be built at the Asiatic Station. The following schedule of Navy Yard work in the authorized modernization of battleships, which does not involve gun elevation, also was announced: *Florida* and *Utah* to Boston; *Arkansas* and *Wyoming* to Philadelphia; *Texas* and *New York* to Norfolk Navy Yard. Regarding the *Texas*, it is claimed that, when her modernization is completed, she will be equally formidable with any fighting ship now in the United States Navy. The complete job will cost about $2,500,000, small comparatively for a vessel that will again be as good as new and up-to-date as well, in view of the fact that to replace her at the present time with an entirely new ship, would cost probably $35,000,000 or more. She is expected to be at the Norfolk Navy Yard for nigh two years.

NAVAL VESSEL DISASTERS

The past year proved no exception in the matter of naval vessel disasters and tragedy, practically all of the leading naval and merchant marine nations throughout the world suffering to a lesser or greater extent. The major disasters with their accompanying tragedies were almost entirely confined to submarines and, strange to say, collision when submerged and on the surface, with merchant ships, was the contributory cause. Probably the gravest of submarine tragedies in the annals of the American Navy was the sinking of the submarine *S-51* off Block Island on September 25 last, following a collision with the passenger and cargo steamship *City of Rome* of the Ocean Steamship Co. of Savannah, Ga.

Saving Veteran War Ships for Posterity.—Half a million dollars is to be raised by American school children, in 10 cent subscriptions, for the rebuilding of the frigate *Constitution*, now lying at the Boston Navy Yard, near where she was launched in 1797. Her wood hull, several times reconstructed during her long years of active service, has now fallen into such weakness and decay that another rebuilding has become imperative. The cost—one-sixth of that of a superdreadnought—could readily have been provided in an Annual Appropriation Bill, but the Navy Department has very wisely left the raising of the necessary money to the patriotic zeal of youthful and grown-up Americans. In the United States Navy, the *Constitution* and her somewhat smaller sister, the *Constellation* at the Newport training station, are the oldest ships that still survive.

CLOSING OF NAVY YARDS

Revised estimates of last year provided for the closing of the Boston Navy Yard, the Charleston, S. C., Navy Yard, the Supply Base at

Brooklyn, N. Y., and either the Great Lakes or the Hampton Roads Naval Training Station. In this connection, it was pointed out that recommendations of the Board, headed by Rear-Admiral Rodman, were being followed. The existing total of 86,000 enlisted men was expected to be maintained. Closing of naval yards has taken place in Great Britain as well as here, and there, possibly, more opposition has appeared to such action.

NAVAL AËRONAUTICS

By William A. Moffett

Chief of the Bureau of Aëronautics, U. S. N.

During the World War, Naval Aviation was assigned the task of supplying patrol-type aircraft for convoy, scouting, and anti-submarine defense measures. It was also assigned the task of training the necessary personnel and equipping and manning the squadrons. At the close of the war, a large number of twin-engine flying boats were on hand and skilled personnel were operating them.

The Task.—Obviously, coastal patrol is but one of the important missions of Naval Aviation. In general, Naval Aviation may be divided into two branches which, for convenience, may be called "Air Service" and "Air Force." Under "Air Service" we have those branches of aviation which are auxiliary to the fleet. Under "Air Force" we have that branch which is an important striking force for offensive work. With the close of the war, Naval Aviation undertook the task of bringing about the development necessary to carry out its missions as a component part of the fleet.

It was decided that six types of aircraft were required:—(*a*) Observation types, to be flown from the decks of combatant ships used for short range scouting and the control of gunfire; (*b*) Fighters, to be flown from combatant ships as well as from carriers, as a means of protection for other types of aircraft; (*c*) Torpedo and Bombing planes, to constitute the basis of the striking force; (*d*) Scouting planes, for long range overseas scouting; (*e*) Patrol types, for coastal patrol, including convoy, anti-submarine defense, and fleet base force reconnaissance; and (*f*) Training airplanes.

Limitations.—Two important limitations have been encountered: first, that of size, and, second, the necessity for economy. Obviously, a modern man-of-war has concentrated in it the maximum in gun power and speed on the limit of displacement. The addition of aircraft to existing ships brings about a limit in the size and weights which can be utilized. The necessity for economy has forced on us the combination of types. Thus, Scouting, Torpedo, Bombing, and Patrol work is now being done in a single-engine twin-float airplane convertible from land to seaplane and therefore available for use on the carriers or from the surface of the sea. In Training planes, we have had to combine primary training, advance training, and gunnery training in the same type. The large twin-engine flying-boat development has gone ahead steadily and has advanced to the PN-9 and PB-1 types designed for the San Francisco-Honolulu Flight, but these have not been purchased in quantity because of the necessity for economy. An aircraft designed for two or more purposes is unlikely to accomplish any of the purposes to the very best advantage, and we have had to accept some limitations in our development.

Engines.—In carrying out our mission in the World War, we confined our efforts to the development of two engines—the Liberty and the Hispano-Suiza; the one for patrol work, the other for training. We were therefore immediately confronted with the problem of developing new engines to suit our particular needs. The Hispano and Liberty were improved and refined pending this development. The Wright Model "T" engine was developed for Torpedo-plane work. The Wright Model "J" (aircooled) was developed for Fighting and Observation work. The Packard 1A-1500 was brought through as a great improvement over the Liberty in the same general power, while the Packard 1A-2500 engine was developed as an improvement over the Model "T" for Bombing, Scouting, and Torpedo planes. The Wright Model "P" was brought through, an aircooled engine in the Liberty field. During the World War, aircraft and aircraft-engine development has been extremely rapid, thanks to the close coöperation between the Navy and the aircraft manufacturers. During the development period, over fifteen million dollars have been spent in the aircraft-engine industry and hundreds of greatly improved engines are now in active service. At the same time, the aircraft-engine industry has been sustained and assisted.

Sea Service.—As a first step in getting Naval Aviation to sea with the fleet, the existing coastal patrol types were organized in squadrons based on tenders which have cruised all over the world with the fleet and have won the highest praise from the fleet command. Through these squadrons the development of the Torpedo plane was actively carried on until now we have, in our three-purpose SC's, a most excellent Torpedo plane. In the meantime, squadrons based on shore were organized for the development of small shipboard aircraft and this development has gone ahead so rapidly that the squadrons are now at sea with the fleet. Catapults were developed for launching seaplanes from the decks of ships, and a most successful Observation airplane, the "UO," has been flown from the decks of naval vessels all over the world. In this matter of shipboard aircraft and catapults, we are definitely in advance of foreign practice.

The small shipboard Fighters for the protection of the Observation types have likewise been brought through and flown from the decks of combatant ships. While these types are not all that we desire, nevertheless, the time for development has been extremely short and the progress made must be considered satisfactory. During the joint exercises off Hawaii, over one hundred fleet aircraft exercised with the fleet and gave a most excellent account of themselves.

In the exercises with the fleet, developments in tactics and material have gone hand in hand. Developments in each have depended upon developments in the other and, as a measure of our success, it may be stated that aircraft spotting has become an absolute essential to the control of gunfire in the fleet.

Carriers.—The close of the war found us with no carriers, but this development was immediately taken in hand. The collier *Jupiter* was converted into the experimental carrier *Langley* and in this floating laboratory we have developed the types of aircraft and the material and technic of carrier work to the point where the results are now being incorporated in the two large carriers, the *Lexington* and *Saratoga*, which, with their aircraft and crews, should be ready late in 1926. These two carriers are among the largest ships in the world and will form the foundation of the Navy's aircraft striking force.

Dirigibles.—In the matter of lighter-than-air craft, the Navy has felt that the chief usefulness of the large rigid type lies in scouting with the fleet. The *Shenandoah* was built in this country and operated successfully for two years. Even her unfortunate loss leaves her with a record of achievement which is not surpassed. The *Los Angeles* was acquired in Germany and has been operated with a view to combining the development of this important arm with the assistance of commercial aviation. Airships over the sea are not subjected to the same trials as airships over the land, and they are of great importance in long-range scouting.

Training.—Aëronautical developments by the government have assisted materially in the advance of commercial aviation. The engineering information obtained has been widely disseminated. The experience of design and development by the industry is now available for commercial aviation. In spite of the post-war difficulties, that portion of the aircraft industry which has shown itself skilled in design and manufacture has been maintained. The Navy has brought about the development of new types to meet its special requirements and is now operating these new types at sea with the fleet. In spite of the loss of a large portion of skilled war-time personnel, Naval Aviation is now in possession of skillful mechanics and pilots. The struggle of Naval Aviation to demonstrate its ability to take its place as an important arm of the fleet has been a difficult one. The difficulties of this struggle have forced us to unusual endeavors, but we are proud to say that Naval Aviation is now an integral and component part of the fleet and that no one realizes more keenly than the Navy itself the very great importance of this new arm.

Relation to the Navy.—Our national policy calls for a small standing army and a much larger Navy. The Navy must always be in a state of readiness for immediate action, and Naval Aviation must be in the same state of readiness. We feel, in Naval Aviation, that the Navy is the front line of the nation's defense and that Naval Aviation is the advance guard of this front line. We feel very keenly our responsibility because it is apparent, with the fleet at sea with its own aircraft, this nation need have no fear of attack from any possible enemy. A powerful, balanced fleet, strong on the surface, under the surface, and in the air, is the nation's best possible guarantee of continued peace and prosperity.

RECRUITING, U. S. NAVY

By L. B. Porterfield

Captain, U. S. N. Bureau of Navigation

Districts and Stations.—During the year 1925 recruiting was carried on throughout the continental limits of the United States by the naval recruiting force distributed in proportion to the density of population so that canvassing for recruits could be carried on uniformly and simultaneously throughout the country. This was accomplished by dividing the United States into thirty-seven districts, following in general the boundaries of the most populated states. In some exceptional instances two states, or parts thereof, were incorporated into one district where states were small, or where territory was covered by forest or desert, thereby rendering such states small for recruiting purposes. In exceptional cases mentioned, some districts were favorable to certain elements of recruiting while others were unfavorable; and as a consequence, compromises in distribution of territory are continually being effected in order that the thirty-seven districts may harmoniously adjust all elements pertaining to the work of this section. These districts are under the jurisdiction of the Bureau of Navigation, Navy Department, Washington. Each district is administered by a main recruiting station (a central office) located in one of the principal cities lying within the district. The personnel of this station is composed of one commissioned officer of the Line, one commissioned officer of the Medical Corps, U. S. Navy, and an average of about twelve enlisted men. In order to cover the district thoroughly, offices known as sub-recruiting stations are opened in the smaller cities within the district, and have for their personnel one or possibly two enlisted men. These sub-stations are responsible in turn to their main recruiting station. Outlying territories which cannot be covered from the main or a sub-station are covered by traveling recruiting parties which go through the district and send recruits back, if they are considered acceptable, to the main station. Applicants for enlistment may apply at either main or sub-stations. Such applicants as apply at sub-stations, after a superficial examination, are sent at government expense to the main station for a thorough examination and enlistment.

Qualifications and Personnel.—After recruits have been thoroughly examined at a main station, they are, if accepted, sent to the nearest training station for training before going to the fleet. Qualifications for enlistment are:—Must be a citizen of the United States; must be not less than seventeen years and not more than thirty-five years of age, and must be physically, mentally and morally qualified. Should applicants be rejected at the main station they are returned to their place of application for enlistment at government expense. In accepting recruits in this manner, great care is necessitated by the recruiting personnel. As a consequence, picked men are selected for this detail. Four hundred and fifty men are now employed on this duty; this number varies, however, in accordance with the demand for recruits. At the start of the year there were two Recruiting Schools, one at Hampton Roads, and one at San Diego, from which all men sent to recruiting duty had to graduate before they were allowed to recruit in the field. These schools greatly helped in the preparation of men for individual recruiting and it is greatly regretted that due to lack of officer personnel these schools have been temporarily discontinued. The recruiting personnel not only obtains men for the Navy, but has for additional duties instruction of Naval Reserve Units, service on Courts and Boards and representation of the Navy in various capacities at civil functions as well as military.

Quality.—The outstanding feature of the recruiting force during 1925 was the high standard maintained and as a consequence the high quality of recruits received. Great care was particularly enjoined on all the recruiting force to accept only applicants whose mental, moral and physical qualifications were excellent. But 10,200 men were required. As a consequence this condition gave a much more favorable opportunity for quality recruiting than in years when great numbers were entailed. At present about half of the accepted recruits have finished one or more years of high school.

Period and Tests.—At the beginning of the year enlistments were made for a period of four years, except in the case of minors seventeen and under eighteen years of age, who were required to enlist for minority only, that is, until they reached their twenty-first birthday. On the approval, March 4, 1925, of Public Bill No. 611, H. R. 2688, the Secretary was allowed discretionary authority to accept men for the Navy for terms of two, three, four and six years, together with minority enlistments. This gave rise to six-year enlistments under the Secretary's authority. The two and three year enlistments were not considered desirable at this time. As a consequence, only four, six and minority enlistments were made. A further provision in this bill allowed for the discharge of all minors who had enlisted without the written consent of their parents, providing the parents made written application for this discharge within sixty days after enlistment. In view of the above, not only must applicants pass a rigid physical test, be qualified both mentally and morally, but must have, if minors, the written consent of their parents. Moral qualifications are determined in all cases by references from reputable citizens. References are investigated before enlistments are consummated. These provisions entailed considerable extra work on the recruiting force, as not only was time taken to check references, but age certificates and consent papers had to be obtained under oath.

Cessations.—On January 31, due to the Navy having sufficient men, all canvassing was stopped and only such men taken as applied at main or sub-stations. This continued until March 16, when all recruiting was discontinued. From this date until April 24, no recruits whatsoever were taken. On this date, the Navy having decreased to approximately 84,000, general recruiting was again resumed. On July 1, 1925, due to appropriations not being sufficient to pay 86,000 men (the allowed strength), recruiting was again stopped and no recruiting was done until September 18, 1925. At this time the enlisted strength was about 82,000 and in order that no increase might be made recruiting stations were assigned a definite number of recruits to be accepted per week as a maximum.

Publicity.—As publicity is a necessary adjunct to recruiting, the Recruiting Bureau at South and Whitehall Streets, New York, is maintained by the Bureau of Navigation to furnish the recruiting service with posters, placards and other publicity mediums. The personnel consists of two commissioned officers and about twenty-five enlisted men. This office has a corps of photographers working under it, who obtain both moving and still pictures of current naval events for issue to newspapers or moving-picture theatres, as the case may be. At present there are for general distribution by each of the various recruiting officers approximately 10,000 feet of travelog films, which can be procured by individuals for showing from the nearest recruiting station.

NAVAL EDUCATION

By Carroll Storrs Alden
Professor of English, U. S. Naval Academy

General Progress.—The Navy has had constantly impressed upon it in 1925 the necessity for rigid economy but has suffered no lessening of responsibilities. The question has been how could the required strength be maintained with the reduced number of units in the fleet and at the shore stations? How could the ships in commission be kept at maximum efficiency with a decreased personnel and a budget far below that recommended? The most satisfying answer has been, educate officers and enlisted men by intensive training and by competition; make each, no matter what is his rank or rating, during the period of his duty a specialist. Never before has this training thus permeated the entire mass from rear admiral to apprentice seaman or fireman or painter, at special school, on board ship, or at shore station. More than all else, there has been marked progress in aviation. To this branch the Naval Academy has for the first time in 1925 given a conspicuous place in its curriculum.

The Naval Academy.—The law of 1917 allowed for each senator, congressman, and delegate five midshipmen, but this was amended in fact if not in form by the appropriation bill of May, 1924, which provided for the pay of only three midshipmen for each. Thus in October, 1925, there were enrolled 1,755 midshipmen, or 744 less than in October, 1923. For the class entering in 1926 the law authorizes in addition to midshipmen appointed by other means twenty-five selected from the Naval Reserve and the Marine Corps Reserve as the result of competitive examination. The mission of the Academy has been recently stated, "To mould the material received into educated gentlemen, thoroughly indoctrinated with honor, uprightness, and truth—with a ground-work of educational fundamentals upon which experience afloat may build the finished naval officer. . . ." The four years' course seeks the development of the individual, the training of the individual as a part of the Service, and the instructing of the individual in the technical subjects of his profession. The midshipman on entrance spends the summer in intensive training furnished by drills in infantry, seamanship, engineering shops, and ordnance (including rifle range), with additional practice in swimming and gymnasium. At the same time by lectures he is indoctrinated in the traditions of the Navy. The work of the academic year, October to June, is divided among eleven departments: Executive, Seamanship and Flight Tactics, Ordnance and Gunnery, Navigation, Engineering and Aëronautics, Mathematics, Electrical Engineering and Physics, English, Modern Languages, Physical Training, and Hygiene. Instruction is carried on by the recitation method, the small sections into which a class is divided, from twelve to seventeen in each, making this possible. In the summer the three upper classes embark on a squadron of battleships designated for the purpose. On them they have practical instruction in the operation of a modern ship, particularly in steam and electrical engineering, ordnance, navigation, seamanship, communications, and ship handling. The cruise in 1925 was made to the West Coast, the squadron going through the Panama Canal and visiting Panama, San Pedro, San Francisco, Astoria, Seattle, San Diego, and Panama. The summer of 1925 brought a change in the curriculum of the First (Senior) Class.

Instruction in Aviation.—While approximately two thirds of their number were undergoing the drills and instruction of the practice cruise, the other third, 150 midshipmen, remained at the Naval Academy for a course in aviation. This was "intensive instruction in ground and flight work," so that with a short course after graduation they might "become qualified either as naval observers or naval aviators." The instruction was in general the same as that given in the "Ground School Course" and "Ground Gunnery" at Pensacola [See "Aviation at the Naval Academy," by Captain H. A. Baldridge, U. S. N., *Naval Institute Proceedings*, Sept., 1925]. The textbooks were the three Pensacola manuals covering aërial navigation, aviation engines, aërology, aviation history, aërial gunnery, bombing, scouting, aircraft communications, theory of flight, and structure and rigging. For the practical side of the instruction a scouting division of six seaplanes with the required officers, qualified naval aviators, and enlisted men were ordered to the Academy. They gave the midshipmen instruction in the air—eight hours for each midshipman—including rules of the road, water handling, sending and receiving radio messages, target practice, navigation, plotting positions—in fact, everything except solo flying. Hereafter this course will be given to each class in the three months immediately following graduation before they are scattered to the various ships of the fleet. The course at the Naval Academy made no attempt to teach more than the fundamentals: "The Academy no more expects the graduate to be a finished flyer upon the completion of the special course here than it expects him to be 100 per cent. proficient as an engineer officer, gunnery officer, navigator, or captain of a dreadnaught upon the completion of his regular four-year course."

Naval Post Graduate Activities.—Somewhat more than seventy graduates of the Naval Academy, the larger number with five years' experience in the fleet, returned to Annapolis in October, 1925, as the entering class for the year in the Post Graduate School course. This is for lieutenants, junior lieutenants, and ensigns selected to specialize in one of the following subjects: ordnance, radio and under-water sound, naval construction, gyro, electrical, mechanical, Diesel, and civil engineering, and aviation. The first year of the Post Graduate School course, at Annapolis, covers merely the ground work, and is the same for all. After this the student officers scatter, one group going for their second year to the Massachusetts Institute of Technology, another to Columbia, another to Rensselaer, another to Harvard, etc. The entire course lasts, according to subject, from twenty-eight months to three years.

The Naval War College.—Officers ordered to the College study the conduct of war in the abstract with special reference to naval warfare, and apply the principles concretely to definite strategic and tactical problems such as would arise if the United States Navy were opposed to possible enemy navies. The War College is not charged with the making of war plans, but its mission has been recently stated, "To assist in the preparation of naval officers for high command in war." And the Junior Course has been defined, "To fit lieutenant commanders and lieutenants for staff duty afloat, or for the command of small units in time of war."

The outstanding feature of its activities in 1925 has been characterized as "Studies of aviation as it affects the strategical and tactical operations of the fleet."

Special Schools for Naval Officers.—In accordance with the system that has been in operation now for several years, officers are prepared for special and regular duty at schools of widely varied character, such as the Submarine School at New London, the Naval Torpedo Station at Newport, and the Naval Air Station at Pensacola. The last has attracted more attention during the past year than any of the others. According to Captain J. J. Raby, U. S. Navy, Commandant of the Air Station [See *Naval Institute Proceedings*, September, 1925], the classes, made up of young line officers and marine officers who volunteer for the duty, vary in size from 40 to 70 members. "The course is nine months, the first month being devoted to ground school, the next five to seaplane training and ground school combined . . . and then three months to landplane training and advanced seaplane work." In one of the tests somewhat after the middle of the course, "The student is required to do two loops in succession, reverse turns, falling leaf, right and left spins, one hour of formation flying, and a precision landing test that consists of climbing to 6,000 feet, spiraling to 3,000 feet, cutting the switch to the magneto so that gravity is the only force acting on the plane, then making two complete turns in a spiral, and effecting a landing within 200 feet of a set mark."

Educating the Enlisted Men.—Every year the Navy must recruit on the average 20,000 men and train the larger number for the especial work required. There are trade schools at the four great training stations and at other places where 2,000 men may be given courses varying from six to thirty-two weeks. Thus those selected have the opportunity of qualifying as electricians, machinists, blacksmiths, coppersmiths, radiomen, pharmacists, bakers, musicians, etc. The great mass of the enlisted personnel, however, must obtain on board ship, the education which enables them to advance in rating. The Navy has prepared seventy-four different courses of study which are furnished free to enlisted men by the Training Division of the Bureau of Navigation. These courses have been divided into three general classes: (1) "Rating courses" (instruction necessary for a man to advance from a lower to a higher rating—e.g., from radioman third class to radioman second class); (2) "general technical courses to increase naval skill" (e.g., installing a distilling plant or a Curtis turbine); (3) "academic courses to further the general education of the individual" (e.g., arithmetic, chemistry, United States history, Spanish). The Training Division says in a statement made in 1925 that about 35,000 of these courses were issued the preceding year. "The conditions under which they are used vary from large study classes with several hours of instruction each week to the single man on a small ship, who pursues his course under the direction of one of the officers of his ship."

Evolutions of the Fleet.—The war game at Hawaii, followed by the cruise of the fleet to Australia and New Zealand during the spring and summer of 1925, was the greatest single contributor to naval education during the year. A statement of the results, being to a considerable degree confidential, will not be attempted here. But it required no vast technical knowledge of the naval profession to understand that the great school of the fleet is the school of experience.

The Spirit of Naval Education.—The ideal of naval education was interpreted by Rear Admiral William V. Pratt, U. S. Navy, President of the Naval War College, in an address, October 22, 1925, on the inauguration of Captain Ralph Earle, U. S. Navy (retired), as President of the Worcester Polytechnic Institute: "To make good disciplined Americans, fit for any service, out of the young men who come to us from all walks of life—this is one of the Navy's foremost works, a work to which we dedicate our lives. We not only give them through our various schools an education which is highly technical, but send them out finished, disciplined men, and above all good Americans, Americans who stand ready to fight your battles if the country ever needs them. This, I believe, is the best work that your Navy does for you in time of peace."

PART FOUR
ECONOMICS AND BUSINESS

DIVISION XIV
ECONOMIC AND BUSINESS CONDITIONS

GENERAL STATE OF BUSINESS

By Solomon S. Huebner
Professor at the University of Pennsylvania

Introductory — A Year of Good Business, Although Not of Boom Proportions.—With the exception of a few leading industries, the general condition of business during 1925 may be described as satisfactory and even flourishing. Comparisons, when based upon statistical data relating to business, must always take into account the nation's normal growth from one decade to another. When this is done, the year 1925 clearly indicates a distinct advance over any year since the last high record of 1919-1920. In one important respect even—the security market—the present year has probably shattered all records of recent times, both with respect to volume of transactions and market appreciation. Here sales, as measured by the number of shares traded in on the New York Stock Exchange, have exceeded those of 1924 by 70 per cent. and of 1919, the previous banner year, by 40 per cent.

Meanwhile the average price of railroad stocks has been elevated to a level which is 16 per cent. in excess of the 1924 average, and 35 per cent. over that of 1921. For industrial stocks the average price has increased by nearly 50 per cent. during the present year, and the October average exceeds the 1921 level by over 54 per cent. Such a spectacular rise in industrial stocks has seldom, if ever before, been experienced within so short a time. The stock market is generally regarded as a discounter of future business conditions. If that view be true, then the future would seem to hold much in store by way of business prosperity. Although not yet of boom proportions, the year 1925 considerably surpasses any previous year since 1920, and is clearly developing a powerful business momentum.

Résumé of Leading Indices of Trade.—A brief résumé of such indices for the first nine or ten months of the year will serve to show the extent to which 1925 exceeds any year since the boom of 1920, and the following depression of 1921. Bank clearings (for 10 months) exceeded those of any similar period, and were 16 per cent. in excess of those recorded for 1924 and 24 per cent. over those of 1920. Railroad volume of traffic for 1925 is record-breaking, with the car loadings by far the largest during the later months of the year. Net earnings in the meantime increased nearly 10 per cent. during the first half of the year as compared with the same period of 1924, while during the month of August, the last for which detailed data is available, the increase has extended to 23¼ per cent. Pig iron production exceeds that of 1924 by

18 per cent., and is almost as great as that recorded for 1920. Copper production during the past ten months also exceeds that of 1924 by over 7 per cent. Building permits for the first nine months of the year exceed those of 1924 by 14 per cent., and total 2½ times the volume of any year prior to 1922. Compared with 1924, 1923 and 1922 (10 months) foreign exports are larger by 8, 18, and 27 per cent. respectively, while imports exceed by 16, 8, and 36 per cent.

Business failures, while approximately the same in numbers for the last three years, nevertheless show a substantial decrease in the volume of liabilities involved, the decline in this respect for the first ten months of 1925 being 30 per cent. as compared with 1924. In fact, for October of the present year, the rate of bankruptcy, both with respect to number and liabilities involved, was lower than in any corresponding month since 1920. Financing operations exceed those of 1924 (for 9 months) by 14 per cent. and those of 1923 and 1922 by 44 and 22 per cent., while new incorporations are larger than those of 1924 by 30 per cent., although still far behind the record-breaking figures of 1919-20.

Along many other leading lines of production the increasing momentum of 1925, as compared with the period since 1921, is clearly apparent. Production of automobiles and trucks during the first ten months of the present year shows an increase over 1924, for the same period, of approximately 13 per cent., while for gasoline the corresponding increase in production is 18 per cent., for bituminous coal 5 per cent., lumber 5 per cent., cement 11 per cent., boots and shoes 5 per cent., and cotton consumption 18 per cent. Recent trade bulletins also indicate that with respect to hides and leather, paper, wool and silk, the demand is well sustained with prices showing a tendency to increase. The rate of employment and wages is now (October, 1925) about the same as that prevailing at the close of 1920, and slightly exceeds the level of October, 1924. Dividend payments of industrial corporations are well maintained, and in many instances, especially in the later months of the year, there have been numerous dividend increases and stock allotments. For the first 11 months of 1925 (Babson figures) industrial dividend payments have exceeded those of the same period in 1924 by 5 per cent., and those of 1923 and 1922 by 10 and 13 per cent.

The number of business indices apparently showing diminished volume of transactions or price tendency is extremely limited. Where such a showing is presented the result is quite natural or not necessarily subject to an unfavorable interpretation. Despite a substantially increased volume of business along nearly all lines, the general level of commodity prices has fortunately shown little advance during the past three years; and the average index price now stands about midway between the yearly average for the last pre-war year, 1914, and the highest point reached following the war, namely in 1920. Similarly, the bond market for gilt-edged investment securities, which reflects quite consistently the tendency in interest rates and commodity prices, has, as will be explained later, experienced little change during the past three years with respect either to the volume of transactions or the general level of price quotations.

Statistics.—The following discussion presents various tables which summarize the business conditions of 1925 in comparison with those of 1924 and earlier years, as shown by those leading barometers of trade* that are generally accepted as the truest index of business conditions. These tables have been grouped under the discussion of the various special subjects to which they relate. The tables relating to "Security Market Transactions," "Security Market Prices," "Volume of Financing," and "New Incorporations," indicate the activity during the year in the security market as well as the condition of the investment demand. The table relating to "Money Rates" furnishes a view of conditions surrounding the money market during 1925. The tables on "Check Transactions," "Imports and Exports of Merchandise," "Production and Price of Pig Iron," "Unfilled Tonnage of the United States Steel Corporation," "Copper Production and Copper Prices," "Railroad Earnings," "Building Operations," "Business Failures," and "Index Numbers," serve to explain the year's activity along mercantile, commercial and manufacturing lines. For purposes of comparison, the figures are given by months for the years 1925 and 1924, and to make possible a further comparison, the totals for the several items, wherever possible, are also given for a number of preceding years.

---

* The author is indebted for the statistical data presented in many of the following tables to the periodic compilation prepared from authentic sources by the Babson Statistical Organization, and issued in *Babson's Reports on Fundamental Conditions.* In the collection of data much assistance was also obtained from the excellent compilations and reviews published periodically in the Commercial and Financial Chronicle.

IRON AND STEEL TRADE

By Solomon S. Huebner

Professor at the University of Pennsylvania

Iron Production.—The 1925 figures of iron production indicate that this basic industry has recovered considerably from the moderate slump of 1924, and that its condition at present may be described as good, although not of boom proportions. For the month of October, the latest for which figures are available at the time of writing, pig iron production in the United States amounted to 3,023,000 tons, as compared with 2,477,000 tons for the corresponding month of 1924, 3,149,000 tons for 1923, 2,638,000 tons for 1922, and 1,247,000 tons during the depression year of 1921. For the first ten months of 1925, total production aggregates 30,128,000 tons, as compared with only 25.635,000 tons during the corresponding period of 1924, an increase of nearly 18 per cent. It should be noted, however, that this year's production for the first ten months is about 12 per cent. under that of 1923 for the same period. Compared with the depression years of 1921 and 1922, however, this year's production (for the first ten months) is larger by about 130 per cent. and 43 per cent. respectively. Despite the substantial increase in production, as compared with 1924, the price for the product (No. 2 Southern at Cincinnati) has not experienced a corresponding rise. For the first ten months of 1925, the price has averaged $23.74. As compared with this figure the average price for the corresponding months of 1924 is $24.13, and for 1923, $28.58. During the latter part of 1925 there has been a distinct tendency towards a rise, and for the month of November an average price of $25.05 is reported.

The Steel Trade.—The volume of the steel business is fairly well indicated by the record of unfilled orders of the United States Steel Corporation. Such orders, usually considered an excellent index of this branch of business, show an average of 4,227,123 tons for the first ten months of 1925 as compared with 3,906,885 for the corresponding months of 1924, 6,328,823 tons in 1923, 5,418,373 tons in 1922, and 5,544,712 tons in 1921. In other words, the unfilled orders of the United States Steel Corporation for the first ten months of 1925 show an increase of slightly less than 10 per cent. as compared with the corresponding period of 1924. This increase is only moderate and loses its significance when compared with the average unfilled orders for the years prior to the year 1924. It is interesting to note that during the five years of great prosperity from 1916 to 1920 inclusive, the record of unfilled tonnage reached such high figures as 10,300,000 tons in 1920 and over 11,000,000 tons in 1917.

THE COPPER TRADE

By Solomon S. Huebner

Professor at the University of Pennsylvania

Production and Price.—The total production of copper in the United States for the first eight months of 1925 was 1,133,800,000 lbs. as compared with 1,048,800,000 in the corresponding period of 1924, an increase of slightly over 8 per cent. August production in 1925 of 137.0 million lbs. compares with 133.0 millions for the same month in 1924, 131.0 millions in 1923, 99.7 millions in 1922, and 21.4 millions during the depression year of 1921.

The foregoing figures indicate that production of the metal has increased but slightly during the past three years. Similarly there has also been but slight change in the price of the metal. For the month of September, 1925, the average daily price per lb. for electrolytic copper at New York was 14.46 cts. as compared with a monthly average of 14.79 cts. for January of the same year, and with a yearly average of 13.16 cts. for 1924, 14.61 cts. for 1923, 18.56 cts. for 1922, and 12.65 cts. for the depression year of 1921.

Unlike most other types of basic industries, the copper trade has evidently not recovered the prosperous position it held prior to 1921. Average monthly production during the present year is much lower than for the years 1916-18, being only 141.7 million lbs. as compared with 159.0, 157.0 and 161.0 millions respectively for the three years referred to. The present average price of 14.46 cts. for electrolytic copper at New York compares with the average annual price of 17.50 cts. for 1920, 18.90 cts. for 1919, 24.68 cts. for 1918, 29.19 cts. for 1917 and 28.46 cts. for 1916. As a matter of fact, during March of 1918 the monthly average price reached the really remarkable height of 35.74 cts.

Copper Stocks. The continued low demand for copper seems to have had its unfavorable influence upon the price of leading copper shares. Using Babson's representative list of twenty leading copper stocks, we find that the average price of these shares stood at only 28.0 for the first ten months of 1925 as compared with 29.8 for the same period in 1923, 33.2 in 1922

COPPER PRODUCTION

Source of data—*American Bureau of Metal Statistics.*

(Unit: 1,000,000 pounds.)

	Jan.	Feb.	Mar.	Apr.	May	June	July	Aug.	Sept.	Oct.	Nov.	Dec.	Avg.
1925	149.6	137.9	149.8	141.3	141.1	140.0	137.0	137.1	....	....	....	....	....
1924	133.3	131.4	130.2	132.1	131.2	127.9	129.6	133.1	127.6	137.9	136.6	135.3	132.2
1923	112.2	102.7	121.6	117.9	125.5	125.5	125.4	131.1	125.3	132.1	127.8	129.7	123.0
1922	25.8	37.4	62.3	77.0	92.0	95.2	93.5	99.7	95.0	103.4	101.6	104.7	82.3
1921	85.9	76.5	89.1	51.1	24.2	19.4	17.8	21.4	20.9	24.6	22.3	18.6	39.3

and 35.9 in 1920. It is interesting to note that these same shares averaged 42.8 in 1919, 55.2 in 1917, and 57.1 in 1916. As will be explained later, in connection with the security market, the copper group of shares is exceptional with respect to recent price movements, in that it has not participated in the same way as have the rail and industrial groups of stocks in the tremendous bull market of the last few years.

FOREIGN TRADE

BY SOLOMON S. HUEBNER

PROFESSOR AT THE UNIVERSITY OF PENNSYLVANIA

Volume of Foreign Exports.—Exports for the first nine months of 1925, as reported by the Bureau of Statistics of the Department of Commerce, total $4,504,828,015, and considerably exceed the corresponding total for 1924, the gain being 380 millions. This gain is particularly significant when we reflect that exports of the first nine months of 1924 exceeded the corresponding period of 1923 by 84 millions, and that those of 1923 again exceeded the corresponding figures of 1922 by another 204 millions.

Although falling far short of the enormous exports of the fiscal years of 1919 and 1918, when the totals were $7,224,000,000 and $5,919,000,000 respectively (due largely to the needs of devastated Europe and the prevalence of exceedingly high prices for leading groups of exports), this year's total for the first nine months nevertheless exceeds the corresponding total for the pre-war year of 1914 ($1,733,000,000) by about two times.

It is therefore clear that our export trade has continued to flourish, and if the pace of the preceding nine months continues, the total bids fair to reach

4¾ billions. If the lower general level of prices is taken into consideration this total is not far behind, judging from the volume of goods shipped as distinguished from the number of dollars involved, the 7 and 6 billions of 1919 and 1918.

Volume of Foreign Imports.—With respect to foreign imports, the tendency during the first nine months of 1925 has been similar to that explained for exports. The total of $3,504,828,015 for that period exceeds the corresponding total of 1924 by 409 millions. Compared with the imports during the first nine months of the pre-war year of 1914 ($1,327,000,000), the corresponding total for 1925, is 2.3 times as great.

With respect to the balance of trade, the tendency is somewhat in favor of the imports. During the present year (for nine months) the balance of exports over imports is 427 millions, as compared with 55 millions for the same period in 1924. These figures compare with an excess of 406 millions in 1913. Expressed in percentages, however, 1913 shows exports to exceed imports by over 30 per cent., whereas for 1925 the figure is only 14 per cent.

BUILDING OPERATIONS

By Solomon S. Huebner

Professor at the University of Pennsylvania

New Construction.—The 1925 figures of new building construction, judging by the value of permits issued for twenty leading cities (representing all sections of the United States) as compiled in the Babson Reports, present a condition of unusual activity in this important field. For the first nine months of 1925 such operations in these twenty cities aggregated $1,826,892,440, as compared with $1,599,896,629 for the corresponding period in 1924, and $1,152,274,000 in 1923. For 1921 and 1920 the corresponding totals were only 715 millions and 660 millions respectively. The total for 1925 thus shows an increase of 14 per cent. over that of 1924. In fact, the present year's total indicates operations to more than 2½ times the value of permits for any year prior to 1922.

The reports of the F. W. Dodge Corporation, for the twenty-seven northeastern states, indicates a total value of building contracts for the first nine months of 1925 of 3,748 million dollars as compared with 3,875 million for the corresponding period of 1924, approximately 3,603 million in 1923, and about 2,500 million for each of the three years 1919-21. Commenting on these figures, the *Commerce Monthly*, published by the National Bank of Commerce in New York, makes the following summary observation:

> In 1922 an enormous program was undertaken and the volume has been maintained in the face of higher costs while the value of contracts awarded has increased steadily each year thereafter. Residential building has been the most important single item. Year by year it has shown substantial gains whereas the total of non-residential construction has run along at practically a stable level. In the 27 eastern states covered by the F. W. Dodge reports contracts awarded for residential building cost from 1.3 billion dollars in 1922 to 1.8 billions in 1924. The total of all classes of non-residential construction has been maintained at approximately 2 billion dollars annually. There have been fluctuations, however, among the different classes included in non-residential work, of which the more important are commercial, industrial, public utility and semi-public construction. . . . Demand, cost of construction and supply of capital are the most important forces that control the building industry. Three principal factors in the demand which has resulted in the sustained program of the last four years may be distinguished—requirements of normal growth, demand resulting from a higher standard of living and the making up of the wartime shortage.

BUSINESS FAILURES

By Solomon S. Huebner

Professor at the University of Pennsylvania

Number of Failures.—The year 1925 bids fair to show about the same number of business failures as the year 1924. By averaging the Dun and Bradstreet figures (according to the Babson compilation) the number of business failures during the first nine months of the present year total 15,233 as compared with 14,992 during the same period of 1924, 13,773 for 1923, 17,806 for 1922, and 13,659 for 1921. The year 1925 thus shows an increase in the number of bankruptcy failures of only about 1.5 per cent. over 1924. As compared with the boom years of 1920 and 1919, however, when failures totaled only 8,693, and 5,893 for the entire year, the number of failures seems large, being about twice as great. During those unusual years, however, nearly every line of business was exceedingly active at extremely high prices and with extraordinary profits, whereas during the present year business as a whole, although prosperous, has not yet reached the same boom proportions. But allowance must also be made, in favor of 1925, for the great expansion since 1919-20 in the number of business concerns reported upon by the two aforementioned mercantile agencies.

Liabilities Involved.—But while the number of failures may seem large, the volume of liabilities involved in the failures presents a much more favorable view. During the first nine months of 1925 total liabilities of failures amounted to only $349,192,175 as compared with $496,167,861 for 1924, a decrease of nearly 30 per cent. For the corresponding periods of 1923, 1922 and 1921, the volume of liabilities amounted to 372 millions, 499 millions and 493 millions respectively. For the years 1920 and 1919, however, and for the reason already indicated with respect to the number of failures, the liabilities presented a solvency record for smallness, namely, 187 and 89 millions respectively. The present situation (for the first ten months of 1925, as well as with respect to the last month reported on, namely, October) is well summarized by the *Commercial and Financial Chronicle* in the following statement:

Comment.—"Insolvencies in the United States during October were fewer in number than in any October since 1920; likewise, the amount of indebtedness reported. There was a small increase in the number of defaults last month over the precedin month, but October failures ar usually more numerous than in September. Liabilities reported fo October, however, were not only les than for September, but smaller tha for any month since August, 1921 with the exception of two months September and June, 1923. According to the records of R. G. Dun & Co., on which these comments ar based, there were 1,581 commercia defaults last month, with a total indebtedness of $29,543,870, as agains 1,465 in September, owing $30,687,319, and 1,696 in October, 1924, fo $36,098,804. For ten months of the current year, 17,664 commercial failures have been reported with liabilities of $371,293,691, against 16,922 during the corresponding period of 1924, with liabilities of $466,822,258.

"The detailed statement for October this year shows 408 defaults in manufacturing lines, with an indebtedness of $11,264,337; 1,111 trading failures owing $13,529,784, and 62 insolvencies of agents and brokers for $4,749,749. The corresponding figures for October, 1924, were respectively: 411 manufacturing defaults for $15,619,253; 1,186 trading failures owing $16,121,861, and 99 agents and brokers for $4,357,690. Some improvement for October this year appears in the report for all three classes."

RAILROAD TRAFFIC AND EARNINGS

By Solomon S. Huebner
Professor at the University of Pennsylvania

Volume of Traffic.—Available statistical data indicates a record breaking volume of traffic on American railroads. Average weekly revenue freight car loadings for October, 1925, stood at 1,107,482, as compared with 890,000 for the month of January of this year, 933,000 for all of 1924, 955,000 for 1923, 844,000 for 1922, and 755,000 for 1921. As reported by the *Commercial and Financial Chronicle* (issue of Oct. 10, 1925): "Freight car loadings continue to break all records of previous seasons, and railroad earnings over the country as a whole are nearly at peak figures."

Gross and Net Earnings.—The increased traffic referred to above, is reflected only slightly in the gross but more substantially in the net earnings of the carriers. *The Commercial and Financial Chronicle's* classified compilation of gross and net earnings for 190 railroads, representing 235,870 miles of road or essentially all of the total mileage for which monthly returns of revenue are filed with the Interstate Commerce Commission, shows that gross earnings for the first half of 1925 amounted to $2,887,608,623 as compared with $2,864,512,167, or practically no increase. Net earnings, however, amounted to $656,663,561, as compared with $597,855,833 for 1924, an increase of $58,807,728, or 9.83 per cent. Commenting on its detailed summary the *Chronicle* concludes: "The first and most obvious comment is that the showing for the first half of the year is satisfactory mainly by reason of the substantial improvement shown in the net earnings. The addition to net of $58,807,728, or 9.83 per cent., has been achieved with an addition of no more than $23,096,456 to the gross. It follows from this that the greater part of the gain in the net earnings is to be ascribed to a reduction in expenses."

Freight Car Loadings.—As previously indicated, the heaviest revenue freight car loadings occurred during the latter months of the year. Hence the later revenue returns are showing up much more favorably than the record for the first half of the year. Thus for August, the latest available figures at the time of writing, gross earnings show an increase of $47,021,764, or 9.26 per cent. over the same month in 1924, while the net earnings were larger by $31,821,455, or 23.26 per cent. Press accounts clearly indicate that this favorable comparative tendency is being continued, although detailed records have not yet been published.

XIV. ECONOMIC AND BUSINESS CONDITIONS

CHECK TRANSACTIONS

By Solomon S. Huebner
Professor at the University of Pennsylvania

Total Clearings.—As an index of general business conditions, existing statistics of check transactions are regarded as probably the best available business barometer, partly because they reflect all lines of business activity, and partly because of their completeness nationally. For the first 10 months of 1925, these transactions exceeded any previous record. The total stands at $495,005,122,000, as compared with 426 billions for the same period of 1924, 408 billions for 1923, 382 billions for 1922, 333 billions for 1921, and 399 billions for 1920. The 1925 record thus exceeds the figure for 1924 for the same period, by over 16 per cent., and the previous high (1920) by over 24 per cent. Allowance must of course be made in these figures for the normal increase in the nation's economic development. Yet when this is done, the 1925 record indicates a satisfactory condition of business as compared with the years following the last high record of prosperity, namely, during 1920.

Transactions Outside of New York City.—With a view to excluding from the nation's total of check transactions the high volume of clearances arising from the speculative markets of New York City, it is important to note the figures for the country exclusive of this outstanding speculative center. Exclusive of New York City, clearings for the first 10 months of 1925 totaled $239,851,526,000, as compared with 214 billions for the same months of 1924, 212 billions for 1923, 181 billions for 1922, 165 billions for 1921, and 201 billions for 1920. The present year thus shows an increase of about 12 per cent. as compared with the preceding two years of 1923 and 1924, and of 19 per cent. over 1920. When allowing for the normal growth of the nation, these figures indicate clearly that 1925 business shows an improvement over 1924 but falls short of the prosperity era of 1920.

The gain of 1925, as indicated by the figures for the week ending October 10, is fairly well distributed throughout the country and is not confined to New York City, as is so often the case. By Federal Reserve districts, the clearings of this week (the last for which statistics are available at the time of writing), as compared with the corresponding week of 1924, show the following increases: Boston district (12 cities), 26.4 per cent.; New York (11 cities), 27.6 per cent.; Philadelphia (10 cities), 26.8 per cent.; Cleveland (8 cities), 11.7 per cent.; Richmond (6 cities), 21.9 per cent.; Atlanta (13 cities), 34.4 per cent.; Chicago (20 cities), 13.9 per cent; and San Francisco (17 cities), 14.4 per cent. Only in the middle states was the showing relatively poorer, namely, St. Louis (8 cities), Kansas City (12 cities) and Dallas (5 cities) with increases of only 8.7, 2.2, and 4.2 per cent. respectively, and Minneapolis (7 cities) with a decrease of 11.2 per cent. For all of the 129 cities referred to above, present clearings average 22.0 per cent. above those of a year ago. It should be noted that bank clearings, exclusive of New York city, are generally regarded as the best single barometer of general business conditions, and that, as will be explained later, there has been no material change in the general level of commodity prices during the past three years, a factor that often distorts clearance statistics as an index of the volume of business actually transacted in one year as compared with another.

Clearings in New York.—For New York City bank clearings amounted to $255,153,596,000 for the first 10 months of 1925, as compared with 213 billions for the same period in 1924 and 197 billions in 1923. This year thus shows increases over the preceding two years of nearly 20 and 30 per cent. respectively. It should also be noted that clearings in New York

City for the past 10 months exceeded those for the remainder of the country by over 15 billions. Such a showing emphasizes the importance of considering New York City separately when interpreting the nation's bank clearings, particularly because it is the great stock and bond market center, as well as the speculative market center for leading commodities, such as cotton, sugar, coffee, and the semiprecious metals. As will be explained later, the volume of transactions in the stock market has greatly exceeded any previous record, and at the same time the general level of stock prices is exceptionally high. This increased volume of transactions at high prices is reflected in the clearings, and it is therefore only natural that the figures for New York City should not only be very large absolutely, but should also show a very substantial increase over the figures of the same locality as compared with previous years.

SECURITIES MARKET

By Solomon S. Huebner

Professor at the University of Pennsylvania

General Conditions.—All of 1925 was marked by tremendous, and at times violent, transactions in the stock market, accompanied by a rapid increase in prices. The excitement has been great on practically all American security exchanges, as well as on the curb market. If a rising and boiling stock market is to be regarded as a discounter of good business conditions, then the future holds much in store along that particular line.

With respect to stocks, speculation has been almost unprecedented and a considerable number of stocks, chiefly in the motor group, increased from 100 to 200 per cent. in price during the past year. During the latter months of the year, dividend increases have been many, as have also stock dividend allotments. The railroad group of stocks, as will be explained later, has enjoyed an average appreciation of market value of over 16 per cent. as compared with 1924, while in the case of representative industrial stocks the appreciation has been phenomenal, the rise in price in a single year exceeding 47 per cent. Along with this great appreciation in market value, the volume of trading has also been extraordinary. This year's total, for the first 9 months only, already exceeds that of 1924 for the same period by over 70 per cent., and that of the previous record-breaking year (1919) by over 40 per cent. Market tendencies seem to be all in favor of the speculative group of securities, and as regards bonds and standard investment preferred-stocks price changes during the present year have been almost negligible and the volume of trading has also been only fairly active.

Stock Prices.—The foregoing remarks relative to the general condition of the security market may be illustrated by Babson's Composite quotations for different groups of selected stocks. As regards his list of 20 representative railroad stocks, the 1925 October high average stands at 104.65 (the highest for any month in the year), as compared with 90.28 for the corresponding month in 1924, only 80.53 in 1923, 74.69 in the depression year of 1921, and 81.33 in 1920. For the first 9 months of 1925 the average high price stands at 100.60, as compared with 86.07, 85.35, 85.62, 74.35, and 76.30 for the years 1924 to 1920 inclusive. Compared with 1924, this year's 9 months' average represents an increase of over 16 per cent. in market value. Compared with the corresponding average of the depression year of 1921, the increase exceeds 35 per cent. Considered by months, the extremes are even greater than is indicated by averages. The high for September, 1925 (103.78), compares with the low of 65.52 for June, 1921, an increase of nearly 58 per cent. The primary cause of the present high level of railroad stocks has no doubt been the tremendous increase in freight haulings, the substantial reduction in the cost of many things that are needed for operation as compared with the period of 1920, and the abundance of funds for speculative operations for the rise.

Indexes of Rise.—Taking Babson Composite Prices for 20 leading an representative industrial stocks, th rise has been phenomenal and record breaking. The average monthly hig price increased during the first months of 1925 from 123.60 (average for January) to 147.73 (averag for September) or over 19 per cent Since that time the average has increased during October (to Octobe 21) to 150.29, as compared with the 1924 yearly average of 102.75, an increase of 47 per cent., and with 97.07 for 1923, 95.48 for 1922, and 75.77 for 1920. The last average obtainable for 1925 at the time of this writing, namely, 150.29, it is interesting to note, is considerably more than twice (115 per cent. increase) the lowest monthly average of 1921, namely, 69.86 for July of that year. Such a spectacular rise in industrial stocks has seldom, if ever, been experienced before in so short a time.

Copper Stocks.—Among the leading groups of stocks, the copper group alone has failed to participate largely in the general stock market rise. Again taking Babson's Composite Prices for 20 representative copper stocks, we find that the average for September, 1925, was 28.0, or about the same as the price of 27.6 for the same month of 1924. The 1925 nine months' average stands at 27.9 against 24.9 for the same period in 1924, an increase of 12 per cent., 30.6 in 1923, 33.3 in 1922, 25.5 in 1921 and 36.4 in 1920. While greater firmness in the price of the metal has been indicated during the past year, the quotation for electrolyte copper at New York now stands at only 14⅝ cents. The opinion seems to prevail that with production at an increased rate, the price of the metal is not likely to experience a substantial increase, and it is this fact that probably accounts for the aforementioned situation with respect to copper stocks as compared with the contrary tendency in the rail and industrial groups. We are also advised that present production of copper materially exceeds foreign and domestic shipments.

Bond Sales.—During the first 11 months of 1925, to November 21, bond sales on the New York Stock Exchange aggregated $3,074,106,000 or nearly 8½ per cent. less than the total of $3,356.701,000 for the corresponding period of 1924. While sales have been fairly large, they are not extraordinary when compared with those of recent years. Interest seems to be directed much more to stocks than to bonds and the tendency at present, judging from the volume of sales in special groups of bonds, seems to be in favor of the more speculative issues with their apparently higher yields. As one leading journal characterizes the situation, "the bond market is undergoing further readjustment as the reins of credit are slowly but effectively tightened throughout the country."

Bond Prices.—With respect to the price level, the 1925 bond market presents but slight change from that of the preceding three years. The bond market, as is usually the case, experienced its rise before the main movement for the rise occurs in stocks. From the average low of 69.4 (for May, 1920, and using the Babson list of 20 leading and representative bonds) the bond market rebounded rapidly to an average of 86.0 for December, 1921, an increase of 24 per cent. This rise represents one of the most sensational in the history of the American bond market, and occurred, as is usual with great bond price movements, during a period of business depression and low interest rates. Since December, 1921, the level of bond prices has remained remarkably constant, despite minor fluctuations. For the month of September, 1925, the Babson average stands at 89.9 as compared with 89.8 as the average for the whole of the first 9 months of the year. This 9 months' average, moreover, compares with 86.8 for the corresponding period of 1924, and with 84.4 in 1923 and 87.0 in 1922. The present lethargy of the bond market, as contrasted with the market for stocks, is no doubt generally traceable to the rising tendency of long term money rates, the flotation of numerous foreign government and industrial issues, and the unusual degree to which the population generally expends its surplus funds for motors or other luxuries, or devotes the same to speculative undertakings.

Volume of Stock Transactions.—All records of previous years, with respect to volume of stock transactions, have been greatly outdistanced by 1925. The previous record occurred during 1919 (just before the great liquidation of 1920) when shares traded on the New York Stock Exchange totaled 316,787,725. This year, from January 1 to November 21, inclusive, although still somewhat short of 11 months, total sales aggregate 400,674,500 shares. This compares with 230,497,460 shares for the corresponding period of 1924, an increase of 74 per cent. It already exceeds the total of all of the previous banner year of 1919 by nearly 27 per cent. Daily transactions during the last few months of 1925 have generally exceeded 2 million shares, and at the time of writing, weekly transactions totaled over 15 million shares. As a matter of interest, 1925 also gave the largest single day's transaction in the history of the New York Stock Exchange, the total being nearly 3¼ million shares, or consid-

erably in excess of the previous high on May 9, 1901, the day of the famous Northern Pacific corner.

Stock transactions have been consistently large all through the year, although the greatest volume of trading occurred during the latter months. For the first 9 months of 1925, share trading on the New York Stock Exchange totaled 307,871,524, as compared with only 178,840,867 for the corresponding period of 1924, an increase of 72 per cent. Even when compared with the first 9 months of the previous record year of 1919, the 1925 total of 307 million exceeds the 224 million total of that year by 37 per cent.

FINANCING AND INCORPORATION

BY SOLOMON S. HUEBNER

PROFESSOR AT THE UNIVERSITY OF PENNSYLVANIA

Volume of Financing.—The total of corporate, foreign government, farm loan, and municipal financing during the first 9 months of 1925 aggregated (according to the detailed compilation of the *Commercial and Financial Chronicle*) $5,286,457,287. Of this total $4,524,708,265 represented new capital, and $761,749,022 the refunding of previous issues. The total is surprisingly large and greatly exceeds that for the corresponding period of any of the preceding four years. It exceeds the total for the first 9 months of 1924 ($4,670,355,955) by nearly 14 per cent. Similar totals for 1923, 1922 and 1921 were 3,663, 4,335 and 2,986 millions. The year 1925 thus exceeds 1923 and 1922 by 44 and 22 per cent. respectively, and the depression year of 1921 by 77 per cent. Of the 1925 total, corporate bonds and stocks represent 4,274 millions, foreign government and corporate securities 467 millions, farm loan issues 125 millions, and municipal issues 1,083 millions.

December	....	734,854,000

Totals,	1924........	$ 7,154,719,050
	1923........	9,370,737,719
	1922........	8,400,153,390
	1921........	7,959,121,300
	1920........	14,999,044,200
	1919........	12,678,229,600
	1918........	2,399,749,600

Incorporations.—In this respect also, the year 1925 shows great activity. During the first 10 months new incorporations in the eastern states with an authorized capital of $100,000 or over (taken from the Babson reports) are reported as aggregating $7,619,061,341, as compared with $5,845,769,050 for the same period of 1924, and with 7,603 millions in 1923, 6,778 millions in 1922 and 6,973 millions in 1921. The year 1925 thus shows to date an increase of over 30 per cent. as compared with 1924 and 13 and 9 per cent. over 1922 and 1921. The present total, however, is far behind the showing (for 10 months of the year) of the boom years of 1919 and 1920, when totals exceeded 10 and 13 billions respectively. These large totals, however, were due to abnormal conditions. Prior to 1919, owing to war conditions, the government had placed drastic restrictions on new capital flotations, and new incorporations in the eastern states fell to the low level of 2,134 millions in 1918. With the removal of these restrictions a complete reversal at once occurred, and the huge increase in 1919 and 1920 is traceable chiefly to the fact that many proposed incorporations which would have occurred in 1918, but which were forbidden, became a reality as soon as possible thereafter. Credit inflation, and the refilling of greatly depleted stocks of many types of goods, owing to the war, also served as contributing factors.

THE MONEY MARKET

BY SOLOMON S. HUEBNER

PROFESSOR AT THE UNIVERSITY OF PENNSYLVANIA

Money Rates.—Despite violent speculation on the security exchanges, an unusual rise in the general price level of stocks, and a substantial increase in general business, money rates have remained reasonably low. Although showing a distinct tendency to harden, as is indicated by the recent increase of the Federal Reserve discount rates at Boston, Philadelphia and Cincinnati to 4½ per cent., they have at no time indicated a credit stringency. For the month of November, 1925, the monthly average rate on four to six months' prime commercial paper is 4⅜ per cent. as compared with an average rate (by months) for the first ten months of the year of 4⅛ per cent. The yearly average thus far is the same as that for 1924 for the same period, and compares with corresponding yearly averages of 5⅛, 4½, 6⅞ and 7½ per cent. for the years 1923, 1922, 1921 and 1920.

With respect to call loan rates at New York, the tendency towards a rise has been somewhat greater than in the case of commercial paper rates. For the month of November, 1925, the call rate has averaged 5 per cent., and on various occasions the rate has gone beyond this figure; whereas during most of the first half of the year the average rate usually fluctuated between 3¾ and 4 per cent., and for all of the first 10 months stands at 4 per cent. The present monthly average of 5 per cent. compares with 3¼ per cent. as the full year's average for 1924, 4⅞ per cent. for 1923, 4¼ per cent. for 1922, 6 per cent. for 1921, and 7⅞ per cent. for 1920.

Demands for Credit.—From many sources come warnings of the possible influence of the present speculative wave in the security and real estate markets upon interest rates, and the opinion is general that the chief demand for increased credit has been in the field of stock exchange and real estate speculation. In its recent review of credit expansion, the National City Bank of New York (bulletin of November, 1925) summarizes the situation very fully. It points out that the loan, discount and investment showing of the member banks of the Reserve System has undergone a material change during the last three years. It explains that in March of 1922 such loans, discounts and investments aggregated $14,527,000,000, whereas on October, 1925, the total had expanded to $19,326,000,000, an increase of about $4,800,000,000, or 33 per cent. Yet these banks, it is explained, transact only about one-half of the nation's banking business. The new gold holdings of the nation, it is explained, have been employed, but of the total aforementioned increase in credits, $2,000,000,000 is declared to represent investments purchased by the banks to keep their funds employed; another $2,000,000,000 is stated to have been loaned on stocks and bonds; while only $750,000,000, between a sixth and a seventh of the total increase, is described as having gone into commercial paper, and mostly during the years 1922 and 1923. The report concludes as follows:

> The influence of the gold importations of the last two years has not gotten directly into the general trade situation. . . . The new supplies of credit have been absorbed by the stock and bond markets and to some extent by the real estate operations. The conditions were favorable to a rise of prices of stocks and bonds, for both have been depressed during the war and after, and since it was in order for an advance to occur, this was an attractive field for speculation, particularly in stocks. Borrowing for the purpose of buying stocks and bonds has been an important factor in their advance.

INDEX NUMBERS AND THE COST OF LIVING

BY SOLOMON S. HUEBNER

PROFESSOR AT THE UNIVERSITY OF PENNSYLVANIA

General Price Level.—The price level of 1925 indicates a slightly increasing tendency, especially in the latter months, as compared with the years 1923 and 1924. Today the average stands about midway between the yearly average of the last prewar year, 1914, and the highest point reached following the war, namely, in 1920.

For the first 10 months of 1925, Bradstreet's index number averages 13.8612, as compared with a high of 20.8690 for the month of February, 1920, and with 8.9985 for the yearly average for 1914. The present year's level thus averages 54 per cent. higher than that of 1914, but nevertheless represents a decline of 34 per cent. from the high of 1920. With respect to retail prices, the decline has also been substantial since 1920, although not to the same extent. In 1920 much of the economic discussion centered around the abnormal cost of living, especially in view of the numerous strikes that prevailed at that time. Today, outside of the anthracite coal shut-down, there are few strikes of large proportions. Employment during October of 1925, judging from the number employed (New York State Department of Labor figures) is about the same as that prevailing at the close of 1920, and during the years 1922 to 1924 inclusive. Wages, on the other hand, according to the same figures, stand at 223 compared with an average of 220 for 1922, 188 for 1921, and 264 for 1920, the year of great inflation along all lines. Most of the economic discussion of today does not emphasize the abnormal cost of living as in 1920, but seems to be centered upon a better adjustment between wholesale and retail prices in important instances, especially with respect to the cutting down of distribution expenses between producer and consumer.

Index Numbers.—For the month of October, 1925, Bradstreet index number averaged 14.1520, as compared with 12.9987 for the corresponding month in 1924, and with 14.0974 in 1923, 12.5039 in 1922, and 11.1879 in 1921. For the first 10 months of 1925, Bradstreet's average index number of 13.8612 is about 9 per cent. higher than the corresponding figure for 1924 (12.7526), but 1924, it must be remembered, represents a decrease of over 5 per cent. as compared with the corresponding number of 1923.

The London *Economist's* index number also indicates but slight variations with respect to English prices, although here the tendency has been in the direction of a decrease rather than an increase. For the month of October, 1925, this number averaged 4,427 as compared with 4,729 for the corresponding month of 1924, and with 4,339, 4,303, 5,004, and 7,746 for the years 1923, 1922, 1921 and 1920 respectively. For the first ten months of 1925 this index number averaged 4,576, as compared with 4,626 for 1924, or a slight rise, as compared with the 9 per cent. increase indicated by Bradstreet's for American prices. Compared with the high of 8,352 for the month of April, 1920, the present figure of 4,427 (October average) represents a decline of 47 per cent. However, compared with the 1914 average of 2,643 it still represents an increase of 67 per cent.

YEARLY AVERAGE OF PRICES

	Bradstreet	London Economist
1901	7.57	1948
1902	7.88	2003
1903	7.94	2197
1904	7.92	2136
1905	8.09	2342
1906	8.41	2361
1907	8.90	2508
1908	8.00	2223
1909	8.51	2231
1910	8.98	2407
1911	8.7129	2542
1912	9.1867	2699
1913	9.2115	2704
1914	8.9985	2643
1915	9.8531	3238
1916	11.8236	4216
1917	15.6385	5418
1918	18.7117	6036
1919	18.6642	6226
1920	18.8096	7746
1921	11.3695	5004
1922	12.1185	4303
1923	13.4028	4339
1924	12.8672	4661

Babson's index numbers (relating to a group of outstanding wholesale commodities entering largely into business, namely, hides and leather, print cloth, petroleum, iron and steel, rubber, paper, wool, building materials, non-ferrous metals, and bituminous coal) also indicates a fairly constant situation during the last four years, the first 9 months' average of 1925 of 167 comparing with 162, 175 and 161 for the corresponding periods of 1924, 1923 and 1922 respectively. During the depression year of 1921 the corresponding average fell to 159, while during the boom year of 1920 the same average reached the record breaking height of 284 (294 for the April individual average). As compared with the average for the first 9 months of 1920, the 1925 corresponding average represents a decline in this important list of basic commodities of nearly 40 pe cent. All the leading index number thus indicate that, after the firs violent drop during the depressio year of 1921, a rebound of norma proportions occurred, but that thi increase has been very gradual during the past three years, with a sligh tendency towards a further increase during the present year.

ORGANIZATION AND CONTROL OF BUSINESS

CONTROL OF PRODUCTION

By John F. Fennelly

Associate Editor of Commerce and Finance

Control of production may mean various things, but to the present generation it signifies above all else the artificial restriction on output through some sort of monopolistic control by producers; as in the case of trusts, etc.

Confusion as to Trusts.—The year 1925 revealed nothing to upset the general belief that, in the United States, we must always have the trust problem with us. Twenty years ago there was some unanimity of opinion as to what constituted monopoly and restraint of trade. Today, however, we are drifting on a sea of doubt more uncertain than ever regarding the wisdom of our established policies of attempting to enforce competition. "To be, or not to be; that is the question." When is a trust not a trust, and why? Or, if it is a trust, does it really matter? The confusion of thought on the subject is most apparent in the present dissension within the Federal Trade Commission which, during the past year, was continually split into two camps, divided not so much by economic opinion as by political differences.

International Monopolies. — The outstanding event of 1925 was not, however, in the field of domestic monopolies within the United States, but was the startling development of international control of raw materials. International monopoly is not a new phenomenon. It has been familiar to students of economics since the time of Adam Smith, and, in recent years, has been well exemplified by the diamond monopoly of South Africa. But now it has been forced upon the attention of the American public, in such a way as to leave no doubt of its importance. It has become a source of grave concern to our government officials who see in this condition the prospect of future trade wars and international ill-feeling.

Coffee and Rubber.—Coffee and rubber are the two commodities which have focused this problem so sharply in the public eye. The so-called "Defense of Coffee" in Brazil, inaugurated two years ago, still continues in operation. Last year it was followed by the Stevenson Plan for restricting the rubber output of the British East Indies. Both plans were started originally with the idea of obtaining "a fair price" for the producer. In each case, however, the producers have not been satisfied with "a fair price," but have pushed the restriction of output to a point where clear monopoly gains have resulted.

The rubber monopoly came into prominence last summer with the spectacular rise in the price of raw rubber to $1.21 a pound. This figure is so far above the cost of producing rubber as to constitute an undoubted case of monopoly of price. Coffee, on the other hand, fell off considerably during 1925 from the high price reached in 1924 when the valorization scheme began to take effect. Nevertheless, the price still remains much above what it would be under normal conditions of free competition. As a result American importations of coffee showed a marked decline during the past fiscal year.

Space does not permit any extended discussion of the details of the plans in question. Suffice it to say that monopolistic control in rubber, as well as in coffee, has been possible because of the concentration of such a large proportion of the world's supply within a small area. Thus, by holding surplus stocks off the market the producers have been able to obtain a greatly enhanced return for the restricted output.

Difficulty of a Remedy.—Now that we are face to face with the problem, the question arises as to what we are going to do about it. Are we to sit quietly by and continue to pay tribute to foreign monopolists, or are we to retaliate by establishing monopolies of our own?

It is easy to say that no permanent monopoly of raw material is possible because of the power of substitution on the part of consumers, and the stimulation to production in other parts of the world when the price rises above the natural cost of production. This is all very true, but it must not be forgotten that the process of substitution is a slow and painful one. Furthermore, in the case of a commodity like rubber, the stimulation to new production cannot affect the supply before five to eight years have passed. Meantime, the consumer suffers.

Possible Retaliation.—Has the United States done anything to retaliate for the protection of the American consumer? Most casual observers will be surprised to learn that important steps in this direction have already been taken, despite the protestations of government officials to the contrary. Thus Secretary Hoover has declared his opposition to all forms of retaliation except as a final resort. He has hinted at the power of this country to establish retaliatory monopolies on such basic commodities as cotton, copper, etc. He has even suggested the possibility of consolidated purchasing agencies in the United States for the protection of the consumer. All these alternatives, declares Secretary Hoover, are merely suggestions only to be considered in case we cannot achieve mutual trade agreements for the abolishment of all such international monopolies.

Monopoly of Capital.—But the American retaliation, already in effect, has not been in the form of anything so crude as the restriction of raw materials. It has come as the subtle result of our quasi-monopoly over the world's supply of capital. The United States is now in the singular position of possessing the one great reservoir of liquid capital in the world. Although we are only gradually realizing it, this has placed in our hands a power for good or evil that transcends in importance any monopolies of raw materials that have yet been established.

The other nations of the world are in crying need of capital to rehabilitate their industries laid waste by the war; a need that is more urgent than our need of coffee and rubber, and one which does not offer the possibility of substitution.

Interference by the United States Government.—Our government officials have been among the first to realize the importance of this situation, and last year began to wield this power for the purpose of coercing foreign countries. This control is entirely without legal sanction and has been effected through a sort of moral pressure from Washington to inhibit foreign loans to countries which we desired to bring to terms.

It was used first with considerable success in hastening the funding of the national war debts owed to the United States. By merely frowning on foreign loans to the nations whose debts remained unfunded, the federal government has been able to exert a pressure that a decade ago would have been thought impossible.

The most recent example of this quasi-monopolistic practice has been the refusal of our government to sanction a loan to Brazil for the purpose of strengthening the "Defense of Coffee." In fact, the weakness in coffee prices during the last months of 1925 was attributed directly to this governmental inhibition. How far this practice will be carried, or what the eventual outcome will be, it is impossible to predict at present. But at least we should recognize that we are not the only nation suffering from international monopolies. We are being forced to pay dearly for certain raw materials, and in turn are forcing other nations to come to terms before we will permit them to obtain access to our money market.

World Afraid of Production.—This world-wide tendency to restrict production by artificial means is the subject of much concern to seri students of economics. What world wants is more and chea goods of every variety and not vicious circle of international mono lies which can only result in maki us all poorer. This situation h been aptly described by B. M. And son, Jr., a prominent American eco omist, as a "World afraid of produ tion," when increased production the only solution of our econom problems.

PRICE FIXING

BY JOHN J. QUIGLEY

DEPARTMENT OF ECONOMICS, COLUMBIA UNIVERSITY

During the year just passed, distinct progress has been made in the direction of clearing up many of the uncertainties which have prevailed regarding the attitude of the government toward business activity. Nowhere was this progress more evident than in the problem of protecting the consuming public against excessively high prices for manufactured articles.

Interests Involved.—In examining the various instances of the development of governmental policy, we must be careful to keep in mind the several conflicting interests involved in the marketing problem. The manufacturer is in business for profit, and so long as the profit be a reasonable one, his claim should be respected. But the price must be kept within the scope of the consumer's purchasing power, not only for his welfare alone, but for that of the producer, as well. Through the very nature of the industrial system, the manufacturer is better able to protect his interests than is the consumer. The result has been an inequality, which the Federal Government has attempted to remove. In the past, the theory has been that all the interests concerned were best served through the maintenance of free competition between producers as well as consumers, and the government has endeavored to maintain such a relation in the market.

Progress.—The first measures taken to gain this end, due to partisan zeal and to ignorance of the facts, had hampering effect upon industry, a resulted in much confusion and u certainty. Court decisions under t new laws were contradictory. Tho business concerns which wanted conform to the law often found ther selves prosecuted for violations.

The government has aimed at th preservation of competition, but th interpreters of the law have found difficult to define competition. I some cases, business concerns hav been prosecuted for maintaining uniform price, and in others, for no maintaining a uniform price.

Gradually, with succeeding dec sions, a more definite policy of governmental control has been formulated. This growth of fundamenta attitude has largely resulted from th division of federal activity into several different fields, which, in turn was made necessary by the increasing complexity of business organization

The efforts of organized business t protect its interests in the market have taken two new forms. These are what is known as "Resale Price Maintenance," and the Trade Association And it is in its attempts to analyze and to control these activities, that the development of governmental policy has been most apparent during 1925.

Resale Price Maintenance.—In this matter the Supreme Court had already made its attitude fairly clear in the previous year. In several important decisions it was explained that as soon as a manufacturing organization had sold its product to the retailer, its control over the price of the article ceased. No obstacle, however, could be put in the way of any company refusing to sell goods to a retailer who cut the price on those goods. But even here no written agreement or understanding could be made between the manufacturer and retailer, fixing the retail price.

And this position has been maintained by the government during the past year. In the only case that has been tried, the terms of the decision are the same as in the previous year. The Court believes that price-cutting is a form of competition, and is to be encouraged, whereas resale price maintenance, by a manufacturer through his distributors or dealers, is a form of price-fixing, preventing competition, and is therefore to be condemned.

We may say, then, that no progressive change has occurred during the year in this department of governmental control of price-fixing. But certainly the definite attitude of disapproval has been maintained and strengthened. And that is as much as could have been expected in this field. For most economists are of the opinion that desirable competition is prevented by successful resale price maintenance, and they look upon the restraining influence of the government as a salutary and progressive development.

Activities of Trade Associations.—With regard to this field of action experts are not so unanimous in their opinion. It is exceedingly difficult to determine whether or not the trade association does restrict competition and so raise prices. The remarkably rapid growth of these organizations in every important industry indicates that the members are finding them financially beneficial. Their representatives claim that this benefit takes the form of decreased expenses of production, which is being passed on in lower prices to the consumer. The Department of Justice has maintained during the whole year that these benefits consist in the higher prices that result from combination, and that they are confined to the members. And this division of the government has acted in accordance with its conviction, by prosecuting several of the largest and most successful of these associations. So the Courts were faced with the problem of defining the policy of the government.

During the year, several important decisions have been rendered. With each one, the attitude of the government has been clarified, and its policy made more definite. Early in the year, what were destined to be the most important cases in this field, were tried in the Circuit Courts. In Michigan, twenty members of the Maple Floor Manufacturers' Association were charged with gathering information concerning stocks, production, sales, and freights, and limiting their production and shipments accordingly. They were convicted of restraint of trade. The case was appealed. At about the same time, in New York, the members of the Cement Manufacturers' Protective Association were charged with similar united action, and convicted. This case also was appealed.

Soon afterward, fifty members of the National Association of Chair Manufacturers, charged with disseminating trade information with the intent to raise prices, pleaded guilty to the actual price increase, and were fined varying amounts, graduated according to the relative amount of business done and the relative financial standing of the companies. At the same time, two hundred and sixty-three large furniture companies, together with the secretaries and assistant secretaries of three national furniture associations, were indicted for gathering statistics which enabled them to control output and shipments in accordance with varying demand. This was in June.

Supreme Court Decision.—A few days later, the Supreme Court rendered a decision on the Hardwood and Cement cases, which had been appealed. In this decision, the verdict of the lower courts was reversed. That trade information had been gathered through an organized group, was admitted. But that the possession of information concerning its competitors, which enabled a manufacturing establishment to produce and distribute more intelligently, was ground for its conviction, was denied. The Court declared that the government had not proved that a destruction of competition had resulted from the actions of the associations, nor that unreasonable restraint of trade had resulted. It declared that even where uniformity of price had resulted, competition was not necessarily absent, especially since the uniform price was reasonable. The opinion went on to say that there was no evidence of any attempt to evade the law; that the Maple Floor Association, especially, had made particular efforts to keep within the spirit of the law. It recognized the importance of the stabilizing influence of the possession of complete and exact information, and declared that the resulting restraint of trade was reasonable.

It is important to note the emphasis that is here placed upon the preservation of competition and the non-increase in prices, for in it lies the explanation of the apparent inconsistency between this decision and those concerning the furniture associations. In the latter case the organized attempt to raise prices and the actual increase in price was definitely proved. In the former, no such attempt could be made evident in the work of the Hardwood and Cement Associations.

Effect of the Decision.—Evidently, then, the progressive tendency in the growth of government policy lies in this unique method of judging business organizations by the effect of their activity upon the welfare of the consumer. Since the present standard of such welfare is low prices, the government is confining its control of business to placing a restraint upon the artificial raising of prices through united action in restraint of competition. This is a new emphasis, something which has only been apparent this year. It is progressive, in that it puts government control of business in a new light, and makes its attitude clearer than ever before. In the words of George T. Buckingham, Counsel for the Cement Associati "The decision is a landmark in construction of the Anti-Trust La It will affect hundreds of trade sociations throughout the land. It probably the most momentous opini on the Sherman Act since the fam Standard Oil Case of 1912."

These decisions are significant, t for their psychological effects up industry. If they have indicated modified attitude on the part of t government, in more exact terms th have been employed heretofore, th indicate also that the government authorities are and will be more vi orous than ever before in enforci the law.

Attitude of Business Men.—B business men recognize this tenden and they appreciate what it will me in the future. Their reaction w clearly indicated in October, at t National Conference on Trade Ass ciations and Business Combinatio held by the Academy of Politic Science, in New York City. Represe tatives of the associations, addressin the sessions, made special referen to the effect of the recent decisio upon the future policy of trade ass ciations. They expressed gratific tion that the Court had given ec nomic considerations full weight making their decisions, that the had judged according to the presen or absence of evil effects, not of th opportunities for evil effects. The recognized the responsibility of kee ing good faith with the consumer tha had devolved upon trade association They emphasized the necessity o using data on trade conditions, no for fixing prices, but for improvin conditions and stabilizing prices a the competitive level. In the opinio of the association members, regulate production, made possible through th dissemination of information amon the members, will stabilize industr and make possible the elimination o the business cycle. However this ma be, in the process, competition may b helped more than harmed by trad association activities, in that all pro ducers, rather than only a few, wil have exact knowledge of market con ditions.

It is claimed by the trade associ

ations that the court decisions have removed the barrier to a great extension of their operations. They declare that the greatest future contribution of trade associations to business stability will be in the form of more complete and accurate information concerning all the stages of business activity and the making of this information available to all producers, distributors, and consumers. The true object of the trade association is to make competition more free, fair, and equal, to all concerned.

The Future.—It is evident that with the exceptions previously noted, the activities of trade associations to date have been solely in the direction of collecting information on conditions within the association, and the distribution of it to the members. In so far as prices have not been increased by this activity, the public cannot be said to have suffered. The vigilance of government control has been the most powerful factor in protecting the public interest in this way. In so far as existing associations have prospered, and new ones have sprung up, we may infer that their activities have benefited the members. The action of the Supreme Court in defining the bounds of such activity, and wisely refraining from unnecessary interference, has made this benefit possible.

The need for government control of business to prevent price fixing has not passed. But the wise distinction between appearances of evil and the fact of its existence, which distinguished the judicial attitude in 1925 should be continued. The Trade Association has large possibilities for good in the future extension of its activity. A wise vigilance on the part of the Federal Government can allow the good results full scope and forestall any evil effects. Any other policy will only inhibit the good without preventing the evil.

CONTROL OF STOCK EXCHANGES

By E. H. H. Simmons

President, New York Stock Exchange

Function.—Markets can be divided into two general classes, depending on the method by which prices are established within them. In closed markets the price-making function is exercised by a few men or even in some cases a single individual, and only slowly and indirectly can public opinion or public purchasing play any part in the process. In free markets, on the other hand, the business of price-making is not undertaken at all by the administrators of the market but is completely opened to public opinion and public purchasing and selling.

Stock exchanges belong very completely to the latter group. It is distinctly not the business of stock exchanges to make prices themselves, but rather to establish and conduct a ready and adequate system whereby prices can be formulated by public purchases and sales. It is therefore the entire American investing public, and not the dealers on the Exchange floor, that determines by its buying and selling, its interest or its indifference, the price levels for the securities dealt in there. The function of the New York Stock Exchange, for example, is clearly confined by the terms of its own Constitution, to providing facilities for the transaction of the business of its members, to maintaining high standards of commercial honor and integrity among them, and to promoting and inculcating just and equitable principles of trade and business.

Rise of New York Stock Exchange.—The present form of organization possessed by the New York Stock Exchange can best be understood by considering its past evolution. The earliest free and open securities market in New York was established about 1792; in form, it consisted simply of a dozen or more stockbrokers who transacted business with each other practically without rules or discipline in the public streets. In 1817 this group of stockbrokers decided, for their greater comfort and convenience, to house their market in a hired room.

This step, seemingly so trivial, was actually basic to the Exchange's entire subsequent development. For it at once became necessary to organize the brokers in a voluntary association with the usual offices of President, Vice-President, Secretary and Treasurer, and to introduce an elective and selective factor into the question of membership in it. In turn, the fundamental power of the market to make rules for its fair and efficient operation, as well as to discipline members who disobeyed such rules, became possible for the first time. A written constitution for the broker's association was formulated and adopted as soon as the market was moved under a roof and from the open street.

In the century which has followed this organization of the Stock Exchange in 1817, its administrative methods have naturally grown hand-in-hand with the volume of its business and the scope of its facilities. Admission to the Exchange's membership was more and more carefully supervised. Regulations as to the particular securities which could be bought or sold on the Exchange became more numerous and more critical in spirit. Methods and practices in trading on the floor were similarly subject to a constantly increasing control and regulation by the Stock Exchange itself.

In the Civil War period, the Exchange purchased its own building on Broad Street, which has subsequently been greatly enlarged and improved in equipment. In the 70s the electric stock ticker system was adopted for the transmission of Exchange price quotations and the telegraph began the transformation of the New York organized securities market from a local to a truly national status. In 1892 a systematic and regular system for the clearance of contracts made on the Exchange was established. These and other similar corollaries to the growing business done on the Exchange floor have since come to be separately incorporated, for the sake of convenience and efficiency, corporations subsidiary to and co pletely controlled by the Stock E change association.

Previous to the Civil War, the a ministrative methods of the Exchan resembled those of an old-fashion New England town meeting—legisl tive and even judicial questions we directly taken in hand by the enti membership. But when the Exchang membership attained its present si of 1,100 members, any such metho became impossibly clumsy and inef cient. Accordingly, the power to a minister the affairs of the Exchang was entrusted to a representati system and placed in the hands of Governing Committee of forty members, all of whom are subject t election by the entire membership an ten of whom are elected each yea The executive function is entruste to the President of the Exchange, bu the legislative and judicial function are exercised by the Governing Committee. The latter has, in turn, tended to delegate most of its importan routine tasks to smaller standing subcommittees drawn from its own membership, and special problems to similar special committees. In consequence, the type of organization developed by the New York Stock Exchange more clearly resembles a average American legislative body than the ordinary American business corporation. Unlike the latter, also, the New York Stock Exchange is not in business and is not designed to be run for a profit.

Present Authority of New York Stock Exchange.—As time has gone on, the scope of the Exchange's supervision over its members' business has steadily increased and to-day it is very extensive in both theory and practice. It is entirely within the power of the Exchange to limit or forbid trading on its floor in all securities save those which conform to its acute and comprehensive listing requirements; on the other hand, trading in any listed security can, at the volition of the Exchange, be at any time suspended or completely prohibited. Similar restrictions are enforced with respect to the Exchange's own membership; apart from purchasing one of the 1,100 existing "seats," a prospective member must satisfy the Exchange as to his financial responsibility and past business career. The distribution of Exchange quotations is carefully supervised lest they fall into the hands of undesirable outside parties and be used to work frauds upon the investing public.

Not only is the business of every Stock Exchange member completely subject to examination by the organization, but it can very quickly enforce disciplinary measures for breach of its rules by imposing fines or else suspending or expelling any member guilty of wrongful practice. Upon the more serious disciplinary cases the Governing Committee sits in a judicial capacity; because of its very great collective experience in the business, its decisions are just and speedy, and because of the complete power conferred upon it by Exchange members under the Exchange's Constitution, it has full power to punish wrong-doing by suspension or expulsion.

Results of the System.—The effect of this administrative machinery possessed by the Exchange upon the business conduct of its members is immediate and distinctive. Offenses which would not be punished by most courts at all, and by no court at once, are promptly and severely dealt with by the Exchange. The business of the Stock Exchange, as has been very generally recognized, is better and more closely regulated to-day by its own administrative machinery than it ever could be by the less speedy and less adaptable methods available to public officials undertaking any species of governmental control. After all, the test of any system of business control lies in the results which flow from it. Only twice in its history (1873 and 1914) has the New York Stock Exchange been forced to suspend dealings for any significant periods. Yet for over a century contracts for the purchase and sale of securities representing tremendous aggregate financial amounts have been effected on the Exchange without written documents, but merely on the commercial honor of its members expressed by oral agreements. Losses entailed by this remarkably free and rapid method of doing business have, nevertheless, proved so small as to be practically non-existent.

BLUE SKY LAWS

By William R. Shands
Virginia State Corporation Commission

Statutory Control of Sale of Securities.—It is almost impossible for one to discuss recent developments in Blue Sky Laws without referring at one place or another to the brief history of such legislation in this country. Although the first law of this kind in the United States was passed by Kansas in 1911, there are at this time forty-two states with similar acts regulating the sale of securities. Four other states—Colorado, Maryland, New Jersey and New York—have adopted laws intended to eliminate the offering for sale and selling of fraudulent and worthless securities within their boundaries, the acts in these states being in the form of fraud laws. While this form of control is much older than that involved in the Blue Sky Laws, it has recently undergone some very novel changes which will be referred to later in this article. No Blue Sky Laws or fraud laws are found in either Delaware, Nevada or the District of Columbia. Except for these two states and the District of Columbia, there are in all the states of this country laws designed to curb the losses taking place annually through the sale of fraudulent and worthless securities.

Blue Sky and Fraud Laws.—The distinction between a "Blue Sky" Law and a fraud law is that the former requires an affirmative act on the part of the State before securities covered by the act may legally be sold in that State, while the fraud acts are designed to prevent the sale of many of the securities that ordinarily would be refused under the Blue Sky Laws by making punishable frauds in connection with such sales. The former method is one by which steps are taken to eliminate the fraudulent securities at the start. The latter punishes those persons who sell such securities involving fraud in the State. The trend since 1911 has been towards the Blue Sky form of legislation, although the operation of the Martin Law in the State of New York is now being watched with considerable interest by the country at large. The supervision given by the Blue Sky Laws has now developed until practically all of the States regulate very carefully both the brokers and agents selling securities as well as the securities themselves.

Legislation of 1925.—The infancy of the Blue Sky Laws makes necessary constant changes in them in order to meet defects and objections as well as new schemes of fraud as they appear. A period of fifteen years has not yet developed one that those most familiar with such legislation will declare is perfect, although each year sees an advance. In spite of this fact probably no recent year has seen as many changes in the various Securities Laws—Blue Sky Laws and fraud laws—as 1925. In thirteen states, or about one-third of those where legislatures convened during that period, such changes were made, amendments to existing laws being enacted in six states, and entirely new laws, revoking old ones, being passed in the remaining seven.

Those states that changed their existing Blue Sky Laws, or as is the case in New York, its fraud law, were Vermont, Pennsylvania, Illinois, New York, Nebraska and South Dakota. Some of these amendments are of such a nature that it may be of interest to call attention to them.

New Provisions.—In Vermont the legislature considered a violation of its Blue Sky Law of such magnitude that it increased the punishment that might be given from ninety days in jail to one year. In Nebraska the Department of Trade and Commerce was given the right to disseminate from time to time by pamphlets or advertisements any information, regarding securities sold or offered fo sale in that State that it might deem to be of public interest or advantage Illinois made some very materia changes in its definitions of "securities," "issuer," "sale" and "dealer" o "broker," as well as of those securities embraced in the classification known as "Class A," adding thereto certain notes or bonds secured by a mortgage lien upon real estate or leaseholds. It also made provisions for the rapid qualification of certain classes of securities. South Dakota which contains in its law a provision that a license to sell securities in that State shall only be issued upon the condition that no Liberty or Victory Bonds shall be taken or accepted as payment or part payment for such securities, also amended its law as to certain of the exemptions.

New York Martin Law.—Because of the strategic position New York occupies in the financial world, the public has watched with much interest the enactment in that State of the "Martin Law," a modern fraud statute. Previous to its recent amendments it vested in the Attorney General, whenever it appeared to him that any device, scheme or artifice to defraud the public was being used or about to be employed in connection with the advertisement, purchase or sale within the State for the future delivery of any commodities dealt in on any exchange in the United States, or of any stocks, bonds, notes, or other securities, the power to require a statement concerning the subject matter. He was also given the power to make investigations and to bring actions to enjoin the matters complained of, and to prosecute personally violations of the Act or to refer such cases to the proper District Attorneys.

The amendments, while taking away none of the powers above referred to, now require dealers before offering any securities for sale in that State to publish in a paper designated as the "State paper" a notice as to such intention giving information as to both the dealer and the securities to be offered. The Attorney General is now able by following these notices to prevent in many cases the commission of any frauds in such sales and in others to eliminate it in its early stages.

Other States.—The states of Wisconsin, North Carolina, West Virginia, Utah, Minnesota, Indiana and Missouri, have enacted new laws revoking those previously in force. The law in Wisconsin now in effect, while passed as an entirely new statute, embodies more or less the principles of the former law. Here, too, the Commission is given powers to disseminate through advertisements and pamphlets information regarding offerings it considers fraudulent whether offered by persons within or without the State for sale to parties within the State by mail, advertisements, in person or otherwise.

In North Carolina the old law has been considerably changed in the new one. Here we find a provision embodied requiring that notes given in payment for stock sold under the act must contain language showing for what they are given. The act further provides that such a note shall state on the face thereof that it is "not negotiable under the negotiable instruments law." Promotion expenses and commissions for the sale of stock are limited to 5 per cent., an amount considerably lower than that now allowed in most of the other states.

In West Virginia, Utah, Minnesota and Indiana the new laws are more or less similar, differing, of course, as to certain details. These laws divide the securities into three groups; an exempt class, a class that may secure a quick qualification, sometimes called "qualification by notification," and a class that can only be qualified by furnishing the Commission detailed information. They also embody exemptions as to securities sold in certain transactions and contain provisions as to licensing brokers and agents who are engaged in selling securities.

Blue Sky Organizations.—Along with the development of the laws themselves there have been numerous organizations working for better laws and a more effective administration and enforcement of them. Among these are the National Association of Securities Commissioners, composed of the State officials charged with administering such laws, the Better Business Bureaus, the Investment Bankers' Association of America, the various Stock Exchanges, and other similar organizations. One of these organizations during 1924 made a proposal with regard to Blue Sky legislation designed to bring about, in so far as may be possible, the enactment of a uniform Blue Sky Law in the place of the forty-two different laws now in force and in 1925 succeeded in having some of the States partially adopt it in their new laws. A Committee of the Commissioners on Uniform Laws has also been studying the subject with an idea of drafting a Uniform Securities Law to be proposed to the various states.

Proposed National Legislation.—Blue Sky legislation has so far been limited to the individual states, but proposals have been made with regard to Federal legislation on the subject designed to supplement the legislation of the different states. One bill of this kind submitted to Congress in the past is the Denison Bill. This bill passed the House in the 67th Congress but failed to pass the Senate. Activities in its behalf continued during 1925, and it no doubt will again be submitted to Congress. In the meantime certain periodicals have proposed what is styled a "Federal Blue Sky Law," the purpose of which is to enact through a Federal statute provisions requiring anyone before using the mails in selling or in offering for sale any securities to file with the Postmaster General information concerning the securities to be offered or sold. This proposal is so new that the attitude of those most concerned with its enactment is not known.

Effect of the Laws.—The suggestion as to Federal legislation on the subject of securities regulation has usually been accompanied by an estimate as to the losses taking place through the sale of fraudulent and worthless securities, and from this has the conclusion been drawn that the Blue Sky Laws of the various states are failures. It is not believed that the conclusion is well founded. Heavy losses through securities frauds are admitted by all, but it is firmly believed that such losses are pitifully small compared with what such losses would be if there were no Blue Sky legislation. The various states with such laws have from time to time made estimates as to the savings effected through them that amply justify the existence of such statutes. If one doubts that the present Blue Sky Laws are successful, he has but to consider the effect in Georgia of a recent decision holding that its Blue Sky Law does not give the Securities Commission the power to regulate the sale of securities by the issuers thereof. In arriving at such results one cannot stop with ascertaining the securities refused as being the amount saved, since for every application refused many other fraudulent and worthless promotions have not even dared to ask for a license. This *i* *terrorem* effect has been increase with each of the numerous prosecu tions successfully conducted unde these laws during 1925.

It is probable that in this field as in many others the public has relie too much on the mere enactment o laws to remedy the evils complaine of. Developments during 1925, however, indicate that the states, while improving their Blue Sky Laws, are making only those changes experience dictates as being necessary, and as never before are attempting to bring to bear the full coöperation of all available agencies in suppressing securities frauds by a sound administration of the laws and the infliction of a sure and heavy penalty on all those who would take from our people their property and money through the sale of fraudulent and worthless securities.

PUBLIC CONTROL OF FUTURES

By Arthur Richmond Marsh

Editor of "The Economic World"

Cotton Futures Act.—Public control of the futures markets for important commodities like cotton, wheat and the other grains, provisions, etc., was first definitely undertaken in this country through the enactment by Congress in August, 1914, of the United States Cotton Futures Act, which was designed by its sponsors to control the behavior of prices on the great Cotton Exchanges in certain essential regards. Since this legislation seemingly affected only cotton merchants and manufacturers, a relatively small group of persons in the population, its far-reaching and in a sense revolutionary character was very little appreciated at the time. In reality, its adoption signified the practical abandonment by our Federal legislators of a principle, or doctrine, that had been scrupulously observed by legislative bodies in the United States and other countries of Anglo-Saxon tradition throughout almost the entire 19th century—the doctrine, namely, that the regulation of commodity prices, or of the markets where commodity prices are made, is no proper function of government, and that when government undertakes such regulation it not only impairs the natural economic freedom of the members of society but also injuriously affects the development and operation of the productive services upon which the material well-being of society depends.

Prices and Distribution.—As is well known, the opposite doctrine held virtually undisputed sway over men's minds in classical and mediæval times, not being seriously challenged either theoretically or practically until the very beginning of the modern industrial era. Only towards the end of the 18th century did the new science of political economy—or economics, as we now call it—gradually make clear the part played by prices in determining the distribution of the productive activities of the population in each given country in such wise that society as a whole may be assured of the needed supply of all the different categories of commodities, goods and services necessary to its existence and comfort. And with this new understanding of the beneficent economic function of prices came the perception that under conditions of social freedom this function will be completely fulfilled only if prices are allowed to respond freely to the influences of supply and demand without interference from government. Left to their own motion, prices will quickly correct both excessive and inadequate production in respect of cash and every kind of goods and services by bringing into operation the natural effort of those affected to adjust themselves to the respective conditions of loss or profit for themselves. So convincing was this new theory of prices and of the virtue of price freedom found by the best minds in the earlier years of the last century that by the middle of the century it was universally agreed in the great industrial and commercial countries like Great Britain and the United States that if society is to progress in a material sense prices must be wholly freed from governmental control. The correctness of this theory, moreover, was soon unreservedly accepted both by legislative bodies and by the courts, with the result that the last vestiges of the older governmental price regulation disappeared.

Legislation and Commodity Prices.—The enactment of the United States Cotton Futures Act by Congress unquestionably connotes a reaction from the doctrine of price freedom just described; and this legislation was the more significant because it was a venture in the field of commodity prices.

It is undoubtedly true that there had been indications of the coming of this reaction some years before, first in the emphasis laid upon questions of price in the anti-trust agitation, of the 80's and 90's, and then in the early insistence of the advocates of public railroad regulation upon the governmental control of rates. Of importance in the latter connection, also, was the re-assertion and enlargement of the well-nigh obsolete doctrine of the right of government to regulate the prices charged for all forms of production and service that are "affected with a public use or interest." Obviously, this concept, once generally accepted as valid, was readily applicable to an ever-widening circle of productive activities, since it is not difficult to assert of any form of production or service that concerns the lives or comfort of large numbers of people, that it is "affected with a public interest." In fact, as everybody knows, this has been occurring more and more frequently in recent years, and it now seldom happens that prices change uncomfortably in any of the great markets without exciting in many quarters an outcry that the public is harmfully affected, and that, therefore, government ought to step in and correct the evil. Furthermore, this idea is now regularly advanced whenever an extension of governmental control of prices in a new direction is proposed.

Price Control.—Despite the rapidity with which this reaction against the 19th century doctrine of complete price freedom developed in the last years of that century and the first years of this, American legislatures were long reluctant to establish a régime of actual price control by government. This reluctance is well illustrated by the fact that it was not until 1906 that Congress gave the Interstate Commerce Commission a kind of tentative authority to prescribe just and reasonable railroad rates, and not until 1910 that this authority was made absolute. The initiation of outright governmental price control for the railroad industry, however, was quickly followed by the application of the same principle to other services generally accepted as "affected with a public interest"—first of all the various public utilities and a little later even such a service as fire insurance. Thus in less than a decade before the outbreak of the European War the regulation of prices by government—whether the Federal Government or the Governments of the States—became an accomplished fact in this country in respect of numerous businesses rendering services grown indispensable to the convenience and comfort of the public at large.

Affected by Public Interest.—The next step was to extend the principle to the field of commodity prices; but here an initial difficulty was encountered in the seeming inapplicability of the rule that government is given the right of price regulation as regards certain businesses by the fact that the businesses are by their nature "affected with a public interest." Neither the production nor the distribution of commodities is "affected with a public interest" in any sense known to the law, however necessary the commodities may be to the life and well-being of society. In framing the United States Cotton Futures Act, however, Congress got round this difficulty by means of the assumption that, even though the absolute price of cotton cannot constitutionally be regulated by government, nevertheless cotton is of such importance in the national economy that the great central markets, or Cotton Exchanges, in which the world's dealings in cotton for future delivery determine the course of the price of the commodity, are practically "affected with a public interest" and may properly be subjected to governmental control in respect of methods and practices affecting the relationship between the basic prices made on the Exchanges and the prices commanded by the different grades and qualities of cotton in the various "spot" markets of the country.

Upon the theory that the price of future contracts on the Exchanges at any given time ought to be approximately the same as the price of Middling cotton in the "spot" markets, allowances being made for differences in the cost of transportation and the like, Congress provided in the Cotton Futures Act that only certain grades of cotton (those from Low Middling up) should be deliverable on future contracts on the Exchanges, and also that the value of the different grades, when delivered, should be determined, not by the commercial judgment of the members of the Exchanges, but by the mechanical process of striking an arithmetical average of the "grade differences" obtaining at the time of delivery in a list of ten Southern "spot" markets designated for this purpose by the Secretary of Agriculture. In other words, Congress, while not undertaking to prescribe the method by which the members of the Exchanges and their customers in the cotton trade and industry should fix the absolute price of the commodity from season to season, month to month or day to day, did assert the right of governmental control over the extremely important price relationships which concern cotton merchants and manufacturers almost as much as the absolute price.

Regulating Prices of Farm Products.—The United States Cotton Futures Act finally became law after the outbreak of the European War, and while the War was in progress Congress refrained from regulatory legislation with reference to other commodity markets, although such legislation was soon advocated in various quarters for the wheat and other grain markets. The demand for such legislation, however, was made less urgent by the excessively high prices attained by all the grains soon after the War began; and by the fact that after this country entered the struggle as a belligerent the Government assumed the function of guaranteeing the farmers a market for the foodstuffs they produced at prices assuring them a very handsome profit on their operations. Hence it was not until after the termination of the Government's price guarantees for wheat and the other grains early in 1921, the effects of which for the farmers were rendered more severe by the great price collapse of 1920-1921, that Congress set about framing a law, similar to the United States Cotton Futures Act, for the control of operations in the futures markets for grain and provisions, particularly the Chicago Board of Trade. This law, commonly known as the Capper-Tincher Act, was approved by the President on August 24, 1921; and it also restricted in important particulars the freedom of commercial action of those dealing in the markets in question, besides conferring extensive regulatory powers upon the Secretary of Agriculture. It should perhaps be said, however, that the provisions of this Act related somewhat less directly to prices, whether in an absolute or in a relative sense, than had those of the Cotton Futures Act. What the sponsors of the Grain Futures Act seem to have aimed at above all was governmental control of speculative operations in the grain markets, the assumption being that such operations had been largely responsible for the ruinous decline of wheat and other grain prices in the Summer of 1921. Thus the Grain Futures Act requires the disclosure to the Secretary of Agriculture of all transactions in future contracts made on the grain exchanges, and gives this officer of the Government large powers of intervention if he does not approve of the volume or nature of such transactions; whereas these provisions are not embodied in the Cotton Futures Act.

Extension of Governmental Control.—The cotton and grain futures markets are the only commodity markets in this country which have so far been subjected to positive governmental control through Federal laws. In this connection, indeed, mention should perhaps be made of the attempt of the Department of Justice early in 1923—largely inspired by Secretary Hoover, according to common report—to check a sharp rise of the price of raw sugar on the New York Coffee and Sugar Exchange through action in the Federal courts predicated upon the assumed applicability of the anti-trust laws to operations in that market; but this attempt came to naught as soon as the Government's case was presented before an experienced Federal judge, the case being dismissed as wholly without merit. It is to be noted, also, that the Federal Trade Commission, besides conducting repeated investigations of the cotton and grain exchanges—investigations that may be regarded as supplementary to the supervision of these exchanges by the Secretary of Agriculture—has busied itself with certain other commodity markets of an unorganized kind, like that for iron and steel and their products, and has caused the abandonment of such methods of price determination as the so-called "Pittsburgh plus" plan of the steel industry. Thus the area of actual or attempted governmental control of markets and commodity prices has been unmistakably extended in various directions in the years since the War.

Few Recent Indications of Exercise of Control.—On the other hand, it must be conceded that there have been few instances of the positive exercise of this governmental control over markets and prices during the year 1925. The Cotton Exchanges have not felt the hand of governmental authority during the year, notwithstanding a growing discontent in the cotton trade and industry with the price effects actually produced by the Cotton Futures Act. As regards the grain exchanges, it is matter of common knowledge that upon one or two occasions during the year the Secretary of Agriculture has been moved by widespread rumors of excessive speculative operations in the wheat market to call for detailed information as to the commitments of all persons or concerns dealing in wheat on the exchanges and, in particular, on the Chicago Board of Trade. It is generally understood, however, that these inquiries have failed to disclose either speculative or commercial activities of an inordinate and censurable kind—that is, activities which by their magnitude or their technical character have produced harmful effects in respect either of the distribution or of the prices of essential commodities. Hence the results of governmental control of the commodity markets during the past year may fairly be said to have been rather negative than positive.

CONTROL OF FOREIGN TRADE

By Julius Klein
Director, U. S. Bureau of Foreign and Domestic Commerce

During the year 1925 about twenty countries have executed more or less comprehensive revisions of their import tariffs or general changes in their duties. In addition, changes in the duties on specific articles or groups of commodities have taken place in nearly all countries.

Sweeping modifications have also been made in many of the official restrictions upon import and export trade—these measures of restraint being, in the majority of cases, either substantially relaxed or almost entirely eliminated. In certain countries, however, the movement has been in the opposite direction.

The negotiation of commercial treaties has been an important feature of the year's developments, about fifty sets of nations having taken up or concluded arrangements to govern trade relations between their nationals. Most of these treaties have included a "most-favored-nation" clause.

As regards measures designed to limit exportation, either directly or indirectly, the especially significant situations have been those relating to coffee in Brazil, where a system of artificial price control is in operation, and to crude rubber in the territories of British Malaya and Ceylon, whose restrictive legislation has occasioned grave embarrassment in the principal consuming countries.

Foreign Tariff Revisions.—Geographically distributed, the countries that have carried out fairly extensive alterations in import duties may be grouped as follows:

In Europe: Austria, Finland, Germany, Hungary, Iceland, Lithuania, Poland, United Kingdom, and Yugoslavia.

In America: British Guiana, Canada, Cuba, Newfoundland, Panama, and Paraguay.

In the rest of the world: Australia, British India, New Caledonia, and the Union of South Africa.

The extent and nature of the revisions have varied with the individual country. Thus, in the case of Austria, the revision was thoroughly going and generally upward; in the case of South Africa, it affected only selected groups of commodities, with the changes sometimes upward and sometimes downward; while in Cuba the revision consisted of adding to most existing duties a small percentage of increase on ordinary merchandise and a higher surtax on luxuries.

Outstanding Tendencies Observable.—Broadly viewed, certain general tendencies stand out. The motive of protection to established or nascent domestic industries was strongly marked in most of the tariff revisions of countries that are at all industrialized. Desire for increased revenue was a prominent motive in nearly all cases, particularly in the non-manufacturing countries and those depending upon customs collections for a substantial part of their governmental income. In a number of the newer countries of Europe, such as Poland, the object of the tariff changes has been to curtail the importation of goods which by them might be considered luxuries, for the purpose of rectifying the general trade balance and improving the exchange value of the nation's currency. On the other hand, the Governments of Canada and South Africa apparently regarded as primary the interests of their agricultural and manufacturing industries, and reduced the cost of bringing into those countries the equipment for agriculture or materials for industry which need to be obtained largely from abroad.

Changes Affecting Specific Commodities.—Besides the relatively comprehensive revisions, changes in the duties on individual articles or groups of commodities have been made during the past year in nearly all countries, to a greater or less extent, as developments in a particular line appeared to call for a readjustment of the conditions of admission of foreign goods.

Other General Revisions in Prospect.—General tariff revisions have been under consideration in a good many countries, including France, Switzerland, Greece, Cuba, Haiti, Colombia, Chile, Argentina, China, and Japan. The degree of progress on these prospective revisions has varied widely; some are expected to result in new tariff acts during 1926, while others may not reach the stage of definite formulation and enactment for another year or more.

Changes in Restrictions on Foreign Trade.—A statement of the revisions in import duties, especially in the countries of Europe, does not convey the full picture of the year's developments in foreign trade control, unless viewed in conjunction with the changes that have taken place during the year in the various official restrictions upon import and export trade.

Under the exigencies of the World War the movement of goods into and out of most European countries was made subject to governmental restrictions of various types. With modifications or extensions these were continued into the years after the war —in various forms, such as requirements for import or export licenses for each individual transaction, exchange restriction upon the credits obtainable for settlement of foreign obligations, or, on certain classes of goods, an absolute prohibition of import or export.

In most countries of Western Europe these governmental restrictions were gradually relaxed within a few years after the World War. In Central and Eastern Europe, however, where the older countries had suffered partition of territory or general economic dislocation, and where a number of new national entities had been created, there were the additional problems of working out a balanced economic structure, adapted to the new boundary lines and resources, and of developing some degree of stability in national budgets and in the value of national currencies. All these complicated the situation immensely and postponed the time when artificial and fluctuating controls upon the exchange of goods with other countries could well be relaxed.

The year 1925 has witnessed considerable progress toward the relaxation of unnatural and unsettling measures of trade control. It may, in fact, be regarded as distinctly ushering in (at least as regards most countries of Europe) a period when international transactions can be planned with assurance of relative freedom from administrative and unpredictable restrictions beyond those definitely set down in the customs tariffs, high as they may be. Perhaps the most striking development of this type during the year was the almost complete abolition of the import licensing régime of Germany which, since the War, had been so prominent a feature of the conditions of doing business with that country as to have made tariff duties, in most cases, of secondary consequence. This radical step took place on October 1, 1925, simultaneously with the bringing into operation of a schedule of higher import duties which alone are now to govern most importations. With some modifications and limitations, necessitated by the peculiar conditions in the country, the action of Germany has been paralleled during the last year or so in a number of other countries of Europe, including Austria, Czechoslovakia, and Hungary.

In certain European countries, particularly in Poland and Greece, the developments during the past year have been in the opposite direction of new and increased restrictions on import and export trade. These measures were rather of an emergency character, and may be expected to be resolved with the passing of the conditions creating them.

Few countries outside of Europe have built up restrictions on imports of ordinary merchandise; so, elsewhere, the year brought few changes.

Negotiation of Commercial Treaties.—The year 1925 has been marked by particular activity in the negotiation of commercial treaties. The fact that about fifty sets of nations have taken up or concluded arrangements to govern the trade relations between their nationals marks noteworthy progress in the process of adjustment to post-war conditions. It also indicates a greater readiness among nations to consider the mutual accommodation of their individual policies of trade control to the needs of commercial intercourse with other nations, so far as they are consistent with the internal interests of each contracting country. The number as well as the necessity of such treaties has naturally been increased by the new national entities, which need to work out a definite basis for trading, both with the older countries and among themselves.

It is significant that the great majority of the treaties of the past year or so have been built on the basic principle of reciprocal promises that each country would treat the other as well as the most favored nation. In many cases these treaties have also carried provisions for specific concessions in duties, or other privileges, on one or both sides. It has been exceptional, however, for a treaty not to carry assurances that if either of the contracting parties later establishes new concessions, or more favorable conditions, for the goods of any third country, the same privileges will be automatically extended to the other nation concerned, without further negotiations or compensations.

The movement for the restoration of equality of trade through commercial treaties has by no means been completed, and certain countries still appear to expect limited and exclusive arrangements, but the past year has witnessed the most important progress since the war in the direction of such equality.

Removal of Certain Handicaps Affecting German Trade.—The most important single development of the year was the termination, on January 10, 1925, of the five-year period during which Germany was obligated to accord most-favored-nation treatment in tariff and related matters to all the Allied and Associated powers, without any similar obligation on the part of those powers toward the products of Germany. The handicaps in various forms, established by the former Allied countries after the war, upon the admission of German good and the operations of German nationals in their territories, have bee very largely removed during the pas year, by the negotiation of commercial treaties readjusting the trade relations with Germany on a more reciprocal basis. Thus far, Germany has been successful in obtaining assurances of most-favored-nation treatment by treaties with the United States, the United Kingdom, Italy Greece, and substantially so with Belgium. Similar arrangements have been concluded with a number of the non-allied countries, including Switzerland, Austria, Hungary, and Portugal. The outstanding problems between France and Germany have naturally been the most difficult to adjust, and negotiations between them are still progressing.

Agreements Concluded by United States.—The United States has made substantial progress during the year toward harmonizing its treaty relations with foreign countries on the general basis of the new policy of unconditional most-favored-nation exchanges. The first thoroughgoing treaty of this type—that with Germany—was ratified by the United States Senate on February 10 and was made definitely effective from October 14, 1925. Temporary commercial agreements on substantially the most-favored-nation basis were concluded during the year by exchange of notes with Poland, Spain, Esthonia, and Finland, pending the working out of thoroughgoing commercial treaties. Similar modus vivendi had already been concluded with Czechoslovakia, Greece, Brazil, Dominican Republic, Guatemala, and Nicaragua. Permanent treaties with Hungary and Turkey await ratification by the United States Senate, and negotiations to the same end with a number of other countries are now under way.

Outside of Europe and the United States the year has been relatively quiet in the field of trade control, at least as affecting imports. In the matter of export control, however, which is of most concern to the Latin-American and Oriental countries producing raw materials, there have been certain significant developments.

Two of the salient situations are discussed below.

Coffee "Valorization" in Brazil.—About 60 per cent. of the world's total supply of coffee is produced on Brazilian plantations, and approximately 70 per cent. of the coffee consumed in the United States is supplied by Brazil. Ninety-three per cent. of all the coffee consumed by the American people comes from the four major producing areas, namely, Brazil, Colombia, Central America, and Venezuela.

Since Brazil dominates in production, and Colombian, Central American, and Venezuelan coffees command a price-premium over Brazilian coffee because of better quality, it follows that artificial price control on the part of Brazil, at higher than usual levels, brings about a relative price increase of the product of the other supplying countries.

For a number of years, Brazilian coffee has been subject to artificial price control, on the part of the Brazilian Government or one of its political subdivisions. One or both of the following methods have usually been adopted:

(*a*) Withdrawal from consumption of large amounts of coffee, through governmental purchasing in the open market, and subsequent resale at intervals when market conditions warranted absorption without depressing the market.

(*b*) Control of the planter's output, withholding in government warehouses, and daily release for export of a fixed quantity below consumption requirements, until such time as market conditions would permit the gradual release of accumulated stocks.

Since the latter part of 1924 this artificial price control—or, as it is commonly termed, "coffee valorization"—has been in the hands of the government of the State of São Paulo, Brazil. That State produces more coffee than any other part of the world—furnishing the great bulk of the Brazilian supply.

In December, 1924, the São Paulo State government enacted legislation providing for a permanent organization to administer coffee valorization. This body is known as "The Coffee Defense Institute," is semi-official in character, and is endowed with extremely broad powers. It is empowered to negotiate loans to carry on its operations; and, under the enabling act, it has already levied, upon each sack of coffee transported across the State, a transportation tax equivalent to 54 cents gold, the proceeds of which are to furnish a guaranty fund for a loan. Additional powers conferred upon the Institute comprise the organization and financing of an agricultural credit institution, the purchasing and selling of coffee in the open market, and the limitation of coffee exports.

During the crop-year ended June 30, 1925, valorization consisted mainly in limiting coffee exports. The average import price of Brazilian coffee, in the United States, increased nearly 55 per cent. over the preceding crop-year, with relative increases in the price of all other grades of coffee, while consumption declined materially.

Coffee importers, fearing a relaxation or removal of the Brazilian valorization restrictions, have, for more than a year, consistently followed a "hand-to-mouth" policy in their buying.

The peak in prices was reached early in the current year. A visible supply in excess of consumption requirements and the reduced milreis price, following the enforced upward course of Brazilian exchange, aided by other factors, caused a slight decline around the middle of the year, although the price level at present is far above normal.

Crude-Rubber Situation. — Although the legislation restricting exports of crude rubber from the important producing territories of Malaya and Ceylon was declared effective on November 1, 1922, the large stocks of rubber already accumulated in the primary, secondary, and consuming markets, the natural increase of production in non-restricted territories as soon as prices improved even slightly, and evasions of restriction through smuggling and forgery prevented its becoming really effective until some two years later. By the end of 1924 all these factors has been eliminated to a considerable extent; smuggling and forgery had been curbed, stocks everywhere had been reduced, and consumption had increased sufficiently to offset the increased production in non-restricted areas. The New York price on December thirty-one was forty cents per pound.

Early in 1925 it became apparent that rubber consumption during the year was going to be much larger than in any previous year, for the following reasons:—(1) The production and use of motor cars in the United States continued at a high rate. (2) The adoption of balloon tires, which consume 20 per cent. more rubber than high-pressure tires, was being accelerated. (3) General prosperity and industrial activity in the United States stimulated the demand for other sorts of rubber goods. And (4) The economic recovery of European countries created a greater use of rubber goods, principally automotive.

During the quarter-year ended February 1, 1925, Malaya and Ceylon could export only 50 per cent of their standard production at the nominal export duty; the normal working of the scheme increased this to 55 per cent. for the following quarter. Such a release was, however, entirely inadequate to meet the increasing demand, particularly since stocks were so reduced, and prices became much firmer. By the end of April they had climbed to 46 cents, and the exportable percentage was increased to 65. By steady progression the price reached $1.21 in July, then receded to $.90, only to return to $1.00, at which point it has stayed. These prices are significant only when it is considered that a price of $.36 yields the 15 per cent. profit that rubber growers say is a fair one.

While these high prices were ruling, the consumption of rubber, both in the United States and in foreign countries, continued to increase even more rapidly than had been anticipated at the beginning of the year. Consumption in the United States during the first nine months of 1925 was 300,000 tons, as compared to 335,000 tons in all of 1924. Prices of finished rubber goods were increased sharply, automobile tires in the United States being subject to four separate increases.

Complications. — Both American and British manufacturers have protested the continuation of the restrictive legislation, but the British Government has declined to have it altered. Representations by the American Ambassador in London resulted in minor concessions, of trifling importance. The scheme continued to operate normally, the exportable percentage being increased to 75 per cent. on August 1 and to 85 per cent. on November 1. It will apparently reach 95 per cent. on February 1 and 105 per cent. on May 1, 1926, after which the relationship of supply and demand will again have a chance to operate unhampered in determining the course of the market. The real rôle of restriction has been to decrease the supply while the demand has been increasing.

The serious consumer situation resulting from such restriction can be alleviated in the case of rubber by three factors: (1) conservation by the public, involving restricted purchasing of rubber products and more careful and complete use of those on hand; (2) the use of reclaimed rubber and of gums which may be employed as substitutes; and (3) the stimulation of the production of wild rubber throughout the world. These, of course, apply to the meeting of the immediate situation, and all of them are becoming effective. To bring the situation to an end, or to alleviate it some years hence, new planting is needed; action is also being taken along this line.

DIVISION XVI
BANKING AND CURRENCY

THE NATIONAL CURRENCY

By Ray B. Westerfield
Professor at Yale University

A comparative statement of the composition and quantity of the currency, showing the changes that have occurred during the past year, is given in the table printed on page 438.

The following important changes in the currency during the year ending November 1, 1925, may be noted:

Gold Coin.—The total gold stock declined $111.6 millions, the gold held in the Treasury fell off $146.2 millions, and the gold in circulation contracted $6.3 millions; whereas the gold held by the federal reserve banks and federal reserve agents increased $40.7 millions. During the year the net excess of gold imports above gold exports was $165,000,000 in round numbers, and, the estimated gold production of the United States was $49,126,000.

It is evident, therefore, that these two factors were without effect in stopping the tendency of the per capita gold coin circulation to decline, it having fallen from $3.85 to $3.75 during the year, and from $8.22 in November, 1920. Any one conversant with custom in the Mountain and Pacific states before and since the late war cannot but have noted the declining frequency of the appearance of gold coins in recent years.

Gold Certificates.—The stock of gold certificates increased during the year $323.2 millions, or about 24 per cent., and the volume in circulation $163.0 millions, or about 18 per cent., and from $8.00 to $9.32 per capita. This change also conforms to the tendency since 1920, for in November, 1920, the circulation of gold certificates was $352.5 million, or $3.28 per capita, and in November, 1925, it was $1,067.9 millions total and $9.32 per capita. Obviously the tendency of the times is to use the representative paper money rather than the metallic coins in circulation; this tendency, while apparent before the war, especially with respect to silver dollars, was greatly accelerated by the impounding of gold in bank reserves during the war and the habituation of the people to the use of paper money.

Federal Reserve Bank Holdings.—Of the increase of $323.2 millions of stock of gold certificates $140.1 millions found their way to the vaults of the Federal Reserve banks and Federal Reserve agents, and $163.0 millions into circulation. The Federal Reserve banks have found it convenient to regulate their reserve ratio by holding on to the gold certificates that come to the bank and issuing against the gold a Federal Reserve note, or, vice versa, by redeeming a Federal Reserve note with gold; impounding gold certificates and issuing Federal Reserve notes raises the reserve ratio.

Silver Coins.—The volume of silver dollars increased $14.6 millions, but the actual circulation fell off about a half million, the dollars finding their way $11.5 millions into the Treasury and $3.5 millions into the federal reserve banks. Of the total stock of $523.7 millions only $54.8 millions are in circulation, and presumably a large portion of these lie in bank vaults much of the time. The

STATEMENT OF THE CURRENCY

November 1, 1924-1925

Kind of Money	Stock of Money (millions of dollars)		Money Held in U. S. Treasury (millions of dollars)	
	1924	1925	1924	1925
Gold coin and bullion	$4,553.6	$4,442.0	$3,845.1	$3,698.9

Treasury notes of 1890	....	....	1.4	1.4	.01	.01
Subsidiary silver	10.4	10.0	259.7	269.4	2.29	2.35
United States notes	36.5	36.4	305.8	306.6	2.70	2.68
Federal Reserve notes	474.5	296.7	1,784.0	1,706.6	15.77	14.90
Federal Reserve bank notes	0.3	0.1	8.7	6.3	.08	.05
National bank notes	23.0	31.2	734.6	667.7	6.49	5.83
Total	$1,319.2	$1,372.8	$4,879.7	$4,900.8	$43.12	$42.77
Total, Nov. 1, 1923	$1,305.0		$4,835.2		$43.27	
1922	1,219.0		4,570.3		41.44	
1921	1,391.0		4,610.9		42.44	
1920	987.9		5,628.4		52.36	

increase in the silver dollars is a result of the Pittman Act of 1918 which reduced many of the existing silver dollars to bullion for export to India and provided for the coinage of an equivalent amount after the war. The silver certificates increased $20.2 millions, but $19.4 millions of these went to the reserves of the federal reserve banks and somewhat less than one million into circulation.

Subsidiary Silver.—The subsidiary silver in circulation increased $9.7 millions, an amount equal to the average annual increase since 1922. The volume of small coins in circulation varies with fluctuations in business activity, and it has now recovered the size it had in the prosperous years 1919-1920. The figures are as follows:

1920	$261.6	millions
1921	259.2	"
1922	239.8	"
1923	254.8	"
1924	259.7	"
1925	269.4	"

Federal Reserve Notes.—One of the most unexpected changes is the decline in the volume of federal reserve notes, the total stock falling $254.9 millions, of which drop $77.4 millions were in circulation and $177.8 millions with the federal reserve banks and reserve agents. The year 1925 has been a prosperous year, and the federal reserve notes are supposed to be an elastic item in our currency, expanding in good times and contracting in poor. The explanation of the contrary behavior in 1925 is that member banks have had surplus funds and found little occasion to rediscount with the federal reserve banks and demand the issue of federal reserve notes. It has been shown that some of those issued were simply in exchange for gold certificates.

The process of redemption of the federal reserve bank notes has continued, $2.5 millions being redeemed during the year, leaving only $6.6 millions, of which $6.3 are still circulating. Lawful money has been deposited with the United States Treasurer for the retirement of all these notes outstanding.

National Bank Notes.—The national bank notes have declined $61.5 millions, and the circulation $66.9 millions. This item in our currency will merit special attention because the process of retirement has begun again. The Federal Reserve Act provided for their retirement, and the process of bond redemption, stopped in 1917, was resumed again in February, 1925. The stoppage was occasioned by war finance, and the high price of the 2 per cent. bonds after 1920 made it unprofitable for the federal reserve banks to convert the bonds and to retire the national bank notes. The high price of the bonds was due to (a) the conversion of $56 millions of the 2's in 1916-1917, and the redemption in 1918 of $64 millions of the 1908-1918 loan, decreasing the supply of bonds; (b) the increase in the number and capitalization of the national banks, creating a basis for more note issues; (c) the prevailingly low rates of interest, making note issues more profitable; and (d) the abundance of loan funds, inclining the banks to use their note issue privilege. The result was an increase of the national bank notes from $724 millions in January, 1921, to $778.0 millions in July, 1924. In February, 1925, the government began to redeem the $118.5 millions 4 per cent. loan of 1925, one of the types of bonds available as security for circulation, and in this manner forcing a reduction in the volume of bank notes.

Total Currency.—The total stock of currency declined $406.7 millions, of which $317.9 millions consisted of the issues of the banks. The per capita circulation fell from $43.12 to $42.77. Inasmuch as this decline occurred during a period of prosperous business, it is clear that the larger business at higher prices must have been conducted either by a larger use of deposit currency or by a more rapid rate of turnover of money. (See articles on Banking, Prices, Business Conditions).

THE GOLD STANDARD

By Frederick W. Gehle

Vice-President, Mechanics and Metals National Bank

Significance.—Gold is the world's recognized standard of value and medium of exchange; it has made its way without the designs of individuals because it has proved itself the one thing accepted in trade everywhere at all times. It is because of this that the developments of 1925, in the fields of banking and commerce, so often found their expression strictly in terms of gold. It is because of this, furthermore, that the gold supply of the United States added so much to the economic dominance of the nation during the year.

In Europe.—What was of outstanding importance in the financial developments of 1925 was the definite return of other nations, notably Germany and Great Britain, to the standard of gold currency from which they had departed on the outbreak of the war. This meant much not only to the economic stabilization of Europe but to the United States, for time after time, since the close of the war, there were heard proposals that the nations which were forced by the war strain to depart from the accepted financial standards should demonetize gold and adopt other standards.

Effect of World War on Europe.—The world was torn loose violently from its old moorings by the events which succeeded 1914; and no one up to 1925 could say positively just what moorings each individual nation would finally tie to when it came again to rest. Never in past history was there such a dislocation in banking reserves as during the period from which the world is now emerging. Great quantities of gold were poured here during the war and afterward, by nations in Europe which found metal payments the quickest and most effective means of securing here the food and other things they urgently needed. A consequence of the war and its aftermath was literally the draining of Europe of gold, so that the banking and currency affairs of the nations of that continent, with a few exceptions, were thrown into confusion. Another consequence was literally the flooding of the United States with metal, so that the nation was confronted with the serious problem of properly adjusting its currency and banking affairs to the power represented by the gold additions.

Effect in America.—Wherever it is lodged, gold seeks employment, and the additions to the American supply were a source of serious concern even before 1925. Under the American banking system gold is a basis of credit that permits large gold expansions by the banks when the gold is properly held. It was therefore the danger of extreme loan increases in the United States, beyond the legitimate needs of domestic business, that was one of the chief concerns of bankers and economists during 1925. Having greatly broadened the basis of the country's credit and cheapened money rates, it was feared that gold resources would result in extraordinary credit activities, leading to over-extension, inflation, rapid price a vances and ultimate business difficu ties.

Fortunately, much of the country gold is lodged with the Federal R serve Banks, and during the year, t keep the banking supplies withi bounds, an organized and intelligen plan was followed of getting gold ou of the banks and into general circula tion. In that way banking reserve were prevented from increasing to rapidly and considerable control wa maintained over the direction o credit. Contrary to many fears pre viously expressed, the credit struc ture was not menaced by the superabundance of gold within the country

Gold Balances.—Nevertheless, it still remains that there is more of the metal here than we need, and not enough in other countries whose currency is, or should be, determined by the gold standard. Efforts have been made to bring about a proper adjustment, and some success has attended these efforts, for gold was shipped in 1925 from New York to Europe. These exports assisted the restoration of both Germany and Great Britain to the gold currency standard. Without them, and without the additional pledge of gold credits, the return of those nations to gold would have been extremely difficult, if not impossible, in the past year.

Balance will be gradually restored in the international financial markets, and in time considerable gold should leave the United States. To be sure, the merchandise movements of 1925 did not make it easy for other nations to command shipments of our gold, for our export trade ran a billion dollars ahead of our imports, plunging foreign people deeper than ever into our debt. But extensive credit operations will do what foreign trade balances in a given period are incapable of doing, and for the American welfare as well as that of other nations, continuing efforts will be made to strengthen the gold position of those people abroad whose solvency will be assured if they are given a proper gold reserve. A return to the gold standard on the part of the world's great trading nations is a logical expectation; its consummation will mean much to the rehabilitation of the world.

The repeated insistence that lasting international prosperity cannot return until the exchanges are restored squarely upon a sound base is not merely an infatuation of gold, nor is it an old-fashioned faith with a worn out theory. It is a practical proposition, accepted wherever all its ramifications are understood. With two of the world's leading commercial nations in 1925 proclaiming their return to the gold standard, therefore, the metal is again, in its old sense, becoming the universal measure of value, medium of exchange and basis of credit.

BANKING

By W. E. Knox

President, Bowery Savings Bank, New York

Total bank resources in the United States in 1925 amounted to $61,700,000,000. The total capital and surplus was in excess of $7,000,000,000 and total deposits over $52,000,000,000.

Changes.—A number of evolutionary changes were apparent in banking developments during the year, an outstanding trend being continued modification of the sharp line of demarcation between definite classes of banks. This came about through the spread in the establishment of departments in banks devoted to activities formerly performed exclusively by other types of banks, such as savings and trust departments. Among the national banks, which at one time were occupied exclusively with commercial banking business, this tendency was especially noted. The same general tendency was also to be noted among state commercial banks.

In state banking laws there was a tendency toward greater uniformity, bringing this class of banks toward more common banking practice.

American Bankers' Association.—The dominant organization in American banking, the American Bankers' Association, in the fall of 1925 celebrated the completion of fifty years of existence. This organization comprises in its membership list 21,700 of the 29,900 banks of the country. Thus from the point of view of members, 72 per cent. of the banks of the country belong to this organization, while in respect to banking capital, about 90 per cent. of the total is represented in the membership of the organization.

In celebration of its fiftieth anniversary the Association established a $500,000 educational fund to provide for scholarships in economics and economic research in colleges and universities in every state in the Union. This is a new feature added to its educational activities. For many years it has conducted the American Institute of Banking for the purpose of training bank employees along scientific lines in the banking business and in 1925 over 30,000 students were enrolled in Institute courses.

The Association acts as a national clearing house of information and technical method for all classes of banking. For administrative purposes it is organized into divisions, sections, commissions and committees for giving specific attention to matters pertaining to each class of bank and to subjects of general interest to banking. The National Bank Division, the Savings Bank Division, the State Bank Division and the Trust Company Division devote their activities to the special interests of the types of banks indicated. The Clearing House Section is engaged in promoting the extension of clearing house organizations throughout the country and in aiding in the technical development of this method of bank coöperation by groups. The State Secretaries Section is engaged in promoting coöperation among the various state bankers' associations and the national body. The Protective Department of the Association, in conjunction with the State Secretaries Section, has been particularly active in recent years in waging a campaign of prevention and protection in respect to the rising wave of crime against banks.

In addition to these various uni there are a number of commissio and committees dealing in detail wi numerous banking questions and r quirements.

THE NATIONAL BANKING SYSTEM

By Gurden Edwards
American Bankers' Association

Due mainly to consolidations and conversions the number of National banks in the United States lessened during the last year from 8115 to 8016. The shrinkage in number, however, did not affect adversely the aggregate assets. On the contrary, National bank resources were higher at the close of business December 31, 1924, than at any other time in the history of the country. The amounted to $24,381,281,000. Tl last report, April 6, 1925, showed slight contraction of resources though they then totalled $23,832 463,000, an increase of $1,769,575,00 since March 31, 1924. The followin statement of condition of the entir National Bank System shows som interesting comparisons:

CONDITION OF THE NATIONAL BANKS
(In thousands of dollars)

Resources	Mar. 31, 1924 8,115 banks	Apr. 6, 1925 8,016 banks	Gain or Loss
Loans and discounts (including rediscounts)	$11,952,287	$12,468,836	+$ 515,549
Overdrafts	10,815	11,410	+ 595
Customers' liability account of acceptances	202,572	240,962	+ 38,390
United States Government securities owned	2,494,313	2,614,185	+ 120,502
Other bonds, stocks, securities, etc.	2,511,637	3,139,255	+ 627,618
Banking house, furniture, and fixtures	525,335	564,103	+ 38,768
Other real estate owned	100,098	112,481	+ 12,383
Lawful reserve with Federal Reserve banks	1,160,766	1,273,274	+ 112,508
Items with Federal Reserve banks in process of collection	379,307	411,539	+ 32,232
Cash in vault	342,969	361,671	+ 19,702
Amount due from banks	1,222,190	1,587,704	+ 365,514
Exchanges for clearing house	842,719	665,288	— 177,431
Checks and other cash items	123,503	122,249	— 1,254
Redemption fund and due from U. S. Treasurer	37,167	33,120	— 4,047
Other assets	157,210	226,386	+ 69,176
	$22,062.888	$23,832,463	+$1,769,575
Liabilities			
Capital stock paid in	$ 1,335,572	$ 1,361,444	+$ 25,872
Surplus fund	1,073,363	1,106,544	+ 33,181
Undivided profits, less expenses and taxes paid	507,905	490,457	— 17,448
Reserved for taxes, interest, etc., accrued	......	60,224	+ 60,224
National bank notes outstanding	726,483	649,447	+ 77,036
Total deposits	17,598,696	19,382,947	+ 1,784,251
United States government securities borrowed	35,684	21,747	— 13,937
Bonds and securities (other than United States) borrowed	2,532	3,821	+ 1,289
Bills payable (including all obligations representing borrowed money other than rediscounts)	238,888	219,198	— 19,690
Notes and bills rediscounted (including acceptances of other banks and foreign bills of exchange or drafts sold with indorsement)	271,645	226,597	— 45,048
Letters of credit and travelers' checks outstanding	6,225	6,537	+ 312
Acceptances executed for customers and to furnish dollar exchange less those purchased or discounted	193,240	232,761	+ 39,521
Acceptances executed by other banks	25,455	29,502	+ 4,047
Liabilities other than those stated above	47,200	41,237	— 5,963
	$22,062,888	$23,832,463	+ $1,769,575

The gain of nearly two billion dollars in deposits, as shown in the statement above, was accompanied by an increase of only half a billion dollars in loans and discounts. The percentage of loans and discounts to total deposits on April 6, 1925, was 64.33 compared with 67.92 a year earlier. These figures show unmistakably a wider practice of the habits of thrift and saving and that borrowing for the conduct of business enterprises has not expanded in the same ratio as resources have increased.

Of the total liabilities for money borrowed amounting to $445,795,000, April 6, 1925, $160,143,000 represented bills payable with Federal Reserve banks and $110,334,000, notes and bills rediscounted with these banks. The reduction in these combined liabilities in the year was $64,738,000.

Notwithstanding the smaller number of National banks their capital was increased during the year from $1,335,572,000 to $1,361,444,000, while surplus funds and undivided profits advanced from $1,581,268,000 to $1,597,001,000.

United States Government securities amounting to $2,614,185,000 show an increase in the year of $119,872,000 and other bonds and securities amounting to $3,139,255,000, an increase of $627,618,000.

The volume of National bank currency was reduced to $649,447,000 by reason of the retirement of $77,036,000 of United States Government bonds which theretofore were held as security for that amount of such notes. No other bonds were made available as a pledge for National bank notes and, therefore, the volume must remain permanently reduced unless Congress invests some additional bonds with the circulation privilege.

National Bank Deposits.—An itemization showing the sources from which deposits liabilities accrue is found in the following table:

TABLE OF DEPOSITS

(In thousands of dollars)

	Mar. 31, 1924	Apr. 6, 1925
Due to Federal Reserve banks	$ 25,328	$ 29,323
Amount due to National banks	886,435	1,147,628
Amount due to other banks, bankers, and trust companies	1,653,347	1,839,935
Certified checks outstanding	187,704	197,508
Cashier's checks outstanding	261,785	204,447
Demand deposits	9,292,127	9,923,243
Time deposits (including postal savings)	5,108,970	5,875,211
United States deposits	183,000	255,652
Total deposits	$17,598,696	$19,382,947

Reserves.—National banks furnish 80 per cent. of the number of bank members of the Federal Reserve System, and their resources are 65 per

TABLE OF RESERVES

(In thousands of dollars. April 6, 1925)

	Reserves Required with Reserve Banks	Reserves Carried with Reserve Banks	Excess Reserves
New England States	$ 89,084	$ 90,263	$ 1,179
Eastern States	568,512	553,634	— 14,878
Southern States	146,366	153,914	7,548
Middle Western States	298,065	312,478	14,413
Western States	75,709	79,169	3,460
Pacific States	82,037	83,816	1,779
Alaska	393	696	303
The Territory of Hawaii	581	1,526	945
	$1,260,747	$1,275,496	$14,749

cent. of the total resources of all members of the Reserve System. The reserves required and the reserves carried with the Federal Reserve Banks aggregate a tremendous sum and they are shown geographically in the table on page 443.

The entire growth of the Natio Banking System has been steady a sound, and the progress which been made during the last year in cates that expansion has not be effected at the cost of either co dence or stability.

STATE BANKS

By Gurden Edwards

American Bankers' Association

Origin.—In American Banking, state banks have always loomed large. They were the pioneers in breaking ground in the development of American banking experience—an experience varied and somewhat checkered, but invaluable in serving as chart and compass in the development of banking principles and methods.

The birth of state banks was coincident with that of the Nation. It was a state bank, the Bank of Pennsylvania, chartered during the Revolution, that financed the infant government and initiated the American system of banking.

Parallel Systems.—After the expiration of the United States Bank in 1836, state banks constituted the only recognized banking system for over a quarter of a century or until the enactment of the National Bank Act of 1863. Since then there have evolved two great banking systems, ranking among the greatest in the world, the State system with 21,350 banking institutions and $34,548,771,000 resources; and the National system with 8043 banks and $24,368,991,000 resources, both rendering indispensable service in their respective fields and providing a system balanced between state and National co trol that operates in the public i terest; moreover, the Federal Reser System has served to bring about a excellent coördination of the faciliti of the two systems—affording us t most sound and scientific bankir facilities ever devised.

State banks, as their name implie are under the jurisdiction of the se eral states—each state establishin its own banking act under whic banks are chartered and supervise by a department of banking under th direction of an officer usually designated as "bank commissioner" o "superintendent of banks."

Unifying Influences.—Among th forces which help unify banking are the American Bankers' Association the State Bank Division of th A. B. A., which is the national association of state banks; and stat bankers' associations in each of th several states. Moreover, the Federa Reserve System as a bank of bank serves to federate all banks and trus companies into a harmonious system The 1544 state banks which are members of the Federal Reserve Systen have total resources of $14,617,876,000. In other words, while stat banks constitute less than one-fift

TABLE OF STATE CHARTERED BANKS

(Years 1919-1924)

	No. of Institutions	Capital	Surplus	Deposits	Loans and Discounts	Resources
1919	21,028	$1,307,000,000	$1,332,000,000	$21,632,000,000	$12,257,000,000	$25,966,000,00
1920	21,923	1,595,243,703	1,450,494,206	23,950,838,611	15,334,616,394	29,191,455,64
1921	22,705	1,734,909,385	1,533,327,012	23,780,750,818	15,449,134,595	29,412,657,02
1922	22,302	1,794,110,615	1,587,458,465	23,510,877,185	14,108,585,847	28,808,553,35
1923	22,084	1,855,237,769	1,450,746,035	27,013,525,116	15,547,076,777	32,081,329,23
1924	21,350	1,915,334,597	1,547,908,798	28,402,756,641	16,264,679,542	34,548,771,00

the membership of the Federal Reserve System, the state bank member resources are over one-third of the total member-bank resources in the system.

Since the issuance of the 1919 *American Year Book*, state banks have increased in number from 21,028 to 21,350, and in resources from $25,966,000,000 to $34,548,771,000, or an increase in resources of 33 per cent. in five years, as indicated in the tabulated report of state chartered banks, herewith given.

TRUST COMPANIES OF THE UNITED STATES

By Gurden Edwards
American Bankers' Association

The phenomenal growth of trust companies of the United States is sufficient proof that they are serving the public in a satisfactory manner. Ten years ago the banking resources of 1,777 trust companies was reported as being $6,300,000,000, while today, 2,600 companies have total resources of $16,000,000,000.

The field covered by the trust company touches almost every phase of human activity. In addition to their banking resources, these institutions hold for safekeeping or administration, as executor, trustee, administrator, guardian, or in other capacities, property variously estimated as being between thirty and sixty billions of dollars. This does not include their many billions of dollars of corporate trusts.

Unifying Methods.—To aid in the conduct and development of this vast business, the Trust Company Division of the American Bankers Association is constantly employed.

In conjunction with the Legal Counsel of the Association, bills introduced in Congress or the several State Legislatures, of interest to trust companies, are carefully studied with a view to assisting in their ultimate passage or defeat.

A special committee on that form of taxation which makes a levy against the transmission of an estate or the right to receive an inheritance is actively employed in solving this problem now troubling a large portion of our citizens.

For the past five years, special work has been done in connection with urging men and women everywhere to put their houses in order through the preparation of properly drawn wills, so that their estates will be conserved and protected rather than dissipated and destroyed.

A close affiliation has been formed with the members of the legal profession, and the trust companies of the country have been urged carefully to avoid the practice of law in the administration of estates and trusts.

Unification or standardization of fees for trust company service has been brought about in many of the states and is under way in others, with a view to giving the public the highest form of service at the lowest possible cost consistent with safety and responsibility of management.

Insurance Trusts.—A great stimulus has been given by this method during the past few years to the formation of a form of trust whereby life insurance policies may be trusteed for the benefit of one's family or other dependents. The segregation of these funds, apart from the estate, is giving a feeling of security and satisfaction to the creator of the trust, as insurance policies are usually paid promptly and in full and are considered one of the highest forms of liquid assets found in the inventories of decedent's estates. In the development of this work, a close affiliation is being made with all insurance companies and underwriters throughout the United States.

The maintenance of the Federal Reserve System in its fullest vigor is being actively promoted through the securing of new members for the System.

FEDERAL RESERVE BANKS

By Randolph W. Burgess

Assistant Federal Agent, Federal Reserve Bank, New York

Gold to Bank of England.—Perhaps the most interesting incident in the operations of the Federal Reserve Banks during 1925 was the completion of an arrangement by which the Federal Reserve Bank of New York with the participation of the other Reserve Banks would place at the disposal of the Bank of England for a period of two years $200,000,000 of gold if desired, as an aid to the reestablishment of a free gold market in London. The exact nature of the transaction was described in the Federal Reserve Bulletin for June, 1925, in the following language:

> Under its arrangement with the Bank of England the Federal Reserve Bank of New York undertakes to sell gold on credit to the Bank of England from time to time during the next two years, but not to exceed $200,000,000 outstanding at any one time. The credit is to bear interest to the extent that it is actually used at a rate of 1 per cent. above the New York reserve bank's discount rate, with a minimum of 4 per cent. and a maximum of 6 per cent., or, if the Federal reserve discount rate exceeds 6 per cent., then at the discount rate of the bank. . . . Upon the purchase of gold the Bank of England will place on its books to the credit of the Federal Reserve Bank of New York an equivalent deposit in pounds sterling. This deposit may be used from time to time by arrangement with the Bank of England in the purchase of eligible sterling commercial bills which shall be guaranteed by the Bank of England, and in that case discount earned on the bills will be applied to the payment of interest.
>
> If occasion arises for the use of this credit, support can be given to sterling exchange either through the purchase of sterling bills in New York or abroad, or gold can be shipped to other countries on British account. Thus the Bank of England could meet a foreign demand for gold without reducing its own reserves, or it could replenish its reserves by withdrawing gold from this country or by earmarking it in New York. The form in which the credit would be used would depend upon the circumstances at the time.

Up to the present time the Bank of England has made no use of this credit but its availability in addition to the credits established by the British Government for the purpose has been a substantial factor in the maintenance of gold payments.

Other Gold Loans.—In addition to this aid extended to the Bank of England the Federal Reserve Bank New York, with the participation other Federal Reserve Banks, has du ing the year made small loans to t Bank Polski secured by gold and h also offered to buy prime endors commercial bills from the Nation Bank of Belgium, if desired.

The domestic operations of t Federal Reserve Banks reflected du ing the year the high rate of bu ness and financial activity whi characterized the year, together wi net gold exports of about $125,00 000. Total extensions of credit the Reserve Banks, represented their total holdings of bills and s curities, increased during the year about 200 million dollars, and in t latter part of the year totaled abou $1,300,000,000. An interesting chang in the composition of these bills an securities consisted of a reduction about 200 million in government s curities held by the Reserve Bank (which represent their voluntary pu chases in the open market) and a increase of about 400 million dolla in direct loans to member banks (i which member banks take the initia tive). These sales of government s curities by the Reserve Banks aggre gating about 200 million dollars wer made during the first three months the year, and as usual resulted i corresponding additional borrowing by member banks from the Reserv Banks.

Discount Rates.—In keeping wit gradually rising open market mone rates during the year the followin increases were made in the discoun rates of the Reserve Banks:

	Date	Change
New York ...	February 27	From 3 to 3
Boston	November 10	" 3½ to 4
Cleveland	" 17	" 3½ to 4
Philadelphia ..	" 20	" 3½ to 4
San Francisco.	" 23	" 3½ to 4

Volume of Operations. — Thes changes resulted in a uniform level

4 per cent. for the discount rates of all the Reserve Banks, except the New York Bank which remained at 3½.

The operations of the Reserve Banks continued to increase in volume during the year. There was a steady growth in the volume of checks collected for member banks and at the end of the year these were running in the neighborhood of 2,600,000 checks a day, with a total value of over $900,000,000. There were similar increases in the amounts of non-cash items collected, securities held in safekeeping for member banks, the amount of funds transferred by wire to and from all parts of the country, coupons collected, etc. The banks continued to receive each day about 30 million dollars of currency and to pay out a like amount of sorted and new currency. At the close of the year the 12 Federal Reserve Banks were all occupying buildings of their own and adapted to their type of operations. They were operating 23 branches as well, and their employees numbered about 10,000. There were 9,500 member banks holding about two-thirds of the banking resources of the country.

Personnel.—There was no change during the year in the personnel of the Federal Reserve Board. Mr. D. R. Crissinger was redesignated by the president to be governor of the Board for the year ending May 1, 1926. In the individual Reserve Banks the principal changes were: D. C. Wills, chairman of the Cleveland bank who had served since the inauguration of the system in 1914, died on October 22. No successor has yet been appointed. B. A. McKinney resigned as Governor of the Federal Reserve Bank of Dallas and was succeeded by Lynn P. Talley, previously chairman of the Board. Mr. Talley was succeeded as chairman by Col. C. C. Walsh.

FARM LOAN BANKS

By Robert A. Cooper
Farm Loan Commissioner, Treasury Department

Organization. — Under the Farm Loan Act, approved July 17, 1916, Congress provided for twelve Federal Land Banks, and for other institutions not limited in number called Joint Stock Land Banks. Supervision was vested in a Farm Loan Board of six members, plus the Secretary of the Treasury. By an amendment of March 4, 1923, twelve Federal Intermediate Credit Banks were created.

The capital account of the system stood, October 31, 1925, at $53,090,485, of which only $1,331,930 was owned by the United States, while borrowing farmers furnished $51,758,555. In addition, there were reserves and surplus equalling $13,241,155.99. The total assets were $1,067,705,789.23. Net earnings from the beginning of business to the end of October were $33,829,161.82, out of which the Banks paid dividends amounting to $13,208,999.90. It is the established policy of the System to charge off real estate acquired by foreclosure, therefore $6,066,585.13 was used for this purpose, and $1,318,524.79 was set aside as a reserve for delinquent installments. There remain undistributed surplus and profit accounts of $13,235,052.

Farm Loan Associations.—Since organization 373,719 farmers have been served through 4,656 National Farm Loan Associations, which are the subsidiary organizations through which the Federal Land Banks conduct their business in the various counties of their respective districts, in a total amount of $1,148,738,648.

Joint Stock Land Banks.—Ten or more persons may organize a Joint Stock Land Bank by subscribing and paying in a capital stock of not less than $250,000. At this time fifty-six banks of this type are operating in practically every State in the Union. It will be noted that while these corporations are privately owned, they otherwise come under Government supervision. Their paid-in capital, October 31, 1925, was $41,044,918.41. Surplus, reserve and other net worth accounts amounted to $9,819,067.05 more. The total assets of these banks were $587,802,826.78. From organization to date they lent $602,885,963 to 79,923 borrowers.

Federal Intermediate Credit Banks.—All of the capital stock of this group is to be subscribed by the Secretary of the Treasury on behalf of the United States, and is to be paid for and held by the Government. Each of the twelve banks, whose domicile and officers are the same as those of the Federal Land Banks, is capitalized at $5,000,000, of which $2,000,000, or $24,000,000 altogether, have been paid in. These banks were devised to provide a credit to farmers of from six months to three years, intermediate between the short term credit of commercial banks and the long term farm mortgage. Direct loans are authorized to coöperative marketing associations, secured by warehouse receipts on staple agricultural products, and rediscounts, representing agricultural transactions, purchased from banks or qualified and capitalized agricultural credit corporations. In the period these Banks have functioned, they made direct loans in the sum of $191,692,574.84, and carried rediscounts in the aggregate amount of $83,719,281.88. As required in the Act, 50 per cent. of the net earnings of the Intermediate Credit Banks, at the end of each calendar year, must be paid into the Treasury as a franchise tax. On December 31, 1924, the tax so paid was $528,313.30. It is estimated that 54,029 farmers have been directly served through the rediscount of their individual notes, and 757,889 indirectly served as members of coöperative marketing associations.

Interest.—No loan on a farm mortgage shall be made under this Act at a rate exceeding 6 per cent., although, as a matter of fact, it has ranged lower, and at present, in some districts, is 5 per cent. In the Intermediate Credit Banks, the interest charge is fixed by the Farm Loan Board, based upon the cost of debentures sold, and at this date it is 5 per cent., both on rediscounts and direct loans.

Funds.—In all three types of bank funds for loaning are procured fro the sale of bonds, the security f which is the mortgages taken by th Banks on land, and the paper repr senting advances on staple agricu tural products. There has been n difficulty in finding a ready sale f these debentures.

Purpose.—The Land Banks cam into existence in answer to a deman that farmers, through a recognize and standard form of security, shoul have access to the money markets o the country on an equality with in dustry, to enable them to procur funds at a reasonable cost. In addi tion to gaining lower rates of interest three other outstanding features o this System may be emphasized namely, abolition of commissio charges, long term contracts, thirty four and one-half years being the rule and amortization of the debt, in con sequence of which renewals are un necessary and ultimate repayment i achieved according to a scientific plan. The Intermediate Credit Banks are not competitors of commercia banks, but coöperators with them in the service they render, providing reservoirs of credit which may be drawn upon in times of stringency and stress.

Causes of Success.—The Federal Farm Loan System has been successful during the years it has operated because, in the first place, it was soundly set up, and, in the second place, it has always followed a conservative policy. Insistence has been laid on the fact that every loan must be adequately secured. There must never be any question of the ability of any bank promptly to meet its obligations. At all times each bank must have 100 per cent. of good mortgages, plus the capital and legal reserve required by the Act, unimpaired, to support all of its outstanding bonds. Moreover, each Federal Land Bank is responsible for repayment of outstanding obligations, and interest thereon, of every other Federal Land Bank, and the same principle holds as to the Intermediate Credit Banks.

The purpose of the Farm Loan Act

primarily is to promote a more prosperous agriculture, and while this demands an adequate supply of credit, it implies also the development of a diversified, well-balanced production, with a suitable scheme of orderly marketing.

Thus the chief thought and purpose of the Farm Loan System is to use such care and discretion in granting loans as will insure the continuance of loans at a low rate of interest, and at the same time exert an instructive influence for the wide spread of safe and successful farming throughout the country.

SAVINGS BANKS

By Gurden Edwards

American Bankers' Association

The Savings bank business in the United States is conducted by mutual savings banks, stock savings banks and the savings departments of state banks, national banks and trust companies. By reason of the fact that Mutual Savings banks have no capital stock, that the National banks in no case segregate capital and surplus for departmental banking, and that the State banks and Trust Companies are required in but a few states to segregate capital and surplus for departmental banking, it is impossible to list the capital and surplus allotted to the savings business.

SUMMARY OF SAVINGS—DEPOSITS AND DEPOSITORS

1912–1924

(Including time certificates and postal savings)

(In thousands of dollars)

YEAR	Mutual Savings	State Banks	Trust Companies	Private Banks	National Banks
1912	$3,595,026	$1,913,962	$1,306,780	$73,521	$1,535,986
1913	3,811,713	2,066,789	1,269,459	67,307	1,368,803
1914	3,910,499	1,976,398	1,336,535	51,266	1,453,838
1915	3,915,017	2,096,590	1,410,107	48,323	1,321,486
1916	4,033,617	2,388,160	1,296,537	43,962	1,715,792
1917	4,249,100	3,281,542	1,192,619	47,817	2,172,666

The advent of savings departments in State banks, National banks and Trust Companies during a ten-year period has caused a decrease in t number of banks doing strictly sa ings business.

SUMMARY OF SCHOOL SAVINGS

SCHOOL YEAR OF	Number of Schools	Number Enrolled Pupils	Number Participating	Collections	Bank Balanc as of June 30, 192
1923–1924	9,080	3,095,012	2,236,326	$14,991,535.40	$20,435,144.

POSTAL SAVINGS

BY WILLIAM E. BUFFINGTON

DIRECTOR, POSTAL SAVINGS DIVISION, U. S. POST-OFFICE DEPARTMENT

Postal Deposits.—The total of the outstanding certificates issued against sums on deposit with the Postal Savings System decreased slightly during the fiscal year. It stood at $132,173,211 on June 30, 1925, as against $132,814,135 on June 30, 1924, having declined $640,924. The number of depositors diminished somewhat more sharply, to 402,325, showing a loss of 10,259, or about 2½ per cent., while the average amount to the credit of each depositor rose $6.61, to $328.52. Extensive transfer of accounts from one post office to another took place; 4,102 accounts thus transferred aggregated $2,292,103, or $236,879 more than in the year preceding. The accrued interest on certificates in the hands of depositors increased slightly to $3,696,455.68.

Proposed Expansion.—Under the act of 1910 creating the Postal Savings System, the total amount that an individual may have on deposit is limited to $2,500, and the rate of interest is set at 2 per cent. Reports from postmasters indicated that many depositors had reached the limit and were prevented by it from making greater use of the system. The Report of the Postmaster General advocated the removal of the existing deposit limit and a slight increase in the rate of interest paid, as means to extend the utilization of the Postal Savings Service. He also propose as a measure likely to aid towar this end, that authority be conferre to receive deposits from officials c fraternal and like organizations.

Postal Savings Bonds.—The la provides that a depositor may ex change certificates of deposit on th first of January or July of any yea for postal savings bonds bearing in terest at the higher rate of 2½ pe cent.; but comparatively few deposi tors applied in 1925 to convert thei deposits into bonds. During the fisca year $331,140 in such bonds wa sought by 331 depositors. There wer outstanding on June 30, $12,234,22 of postal savings bonds, but of thi total $9,752,940 had been repurchase from holders by the Government, an were carried as investments amon the resources of the Postal Saving System. Bonds in the hands of th public totaled $2,481,280.

Totals.—The resources of the Sys tem were mainly in the form of de posits bearing interest at 2½ pe cent., made by postmasters wit qualified local banks, and represent ing money received from depositors i return for postal saving certificate These bank deposits totaled $97,759, 025.37. The System held in additio to the repurchased postal saving bonds, $26,676,750 par value of Lib erty bonds.

CONSOLIDATION OF BANKS

By Gurden Edwards

American Bankers' Association

An outstanding development in American banking in recent years has been that of consolidation. Statistics published in 1925 in regard to this movement in New York City alone showed that since the World War period down through 1924, forty-two important bank mergers were consummated there involving seventy-six individual institutions with over $645,000,000 in aggregate capital funds and $4,295,000,000 in deposits. In Chicago and other large financial centers in the country mergers, consolidations and absorptions involving large interests have also taken place during the period since the war. During 1925 this movement towards consolidation and absorption continued at a high rate.

In addition to the general factors of business expansion bringing about bank consolidations two other chief specific motives for such operations may be mentioned. One is the authorization granted national banks to conduct a trust business and in order to take advantage of this privilege many banks of this class that had previously conducted only straight commercial bank operations purchased established trust companies with their trained expert personnel and accumulated business and experience, enabling them to develop rapidly their own operations in this highly specialized field of banking. The second major cause, overshadowing other factors particularly in New York, was the growth of the branch banking movement in that city. In many cases large banks absorbed other banks established in various neighborhood banking work in order to gain footholds in different parts of the city for themselves. This was a motive leading to consolidations in other places enabling established banks to acquire other established banks as branches.

BRANCH BANKING

By Thomas B. Paton

General Counsel, American Bankers' Association

A summary of state banking statutes covering branch banking within the states, with supplementary information in the absence of statutory provisions, compiled in the office of the General Counsel of the American Bankers Association in April, 1924, shows the following:

Authorizations.—Statewide branch banking is expressly permitted by statute in eight states: Arizona, California, Delaware, Georgia, North Carolina, South Carolina, Rhode Island and Virginia.

Branch banking is permitted as to locality in five states: Louisiana, Maine, Massachusetts, New York and Ohio.

Branches are permitted without express statutory authority in the states of Maryland and Tennessee.

The right to operate branches is implied, but no branches exist in Wyoming.

Branch offices or agencies are permitted, but not "branch banks" in four states: Kentucky, Michigan, Mississippi (powers not expressly limited), and Pennsylvania.

Prohibitions.—In the following sixteen states the statutes expressly prohibit branch banking: Alabama, Arkansas, Colorado, Connecticut, Florida, Idaho, Indiana, Minnesota, Missouri, Nevada, New Mexico, Oregon, Texas, Utah, Washington and Wisconsin.

Without express statutory prohibition, branches are not permitted in the following eleven states: Illinois, Iowa, Kansas, Montana, Nebraska, New Jersey, North Dakota, Oklahoma, South Dakota, Vermont and West Virginia.

In the state of New Hampshire the status of branch banking is uncertain. Information from several sources indicates that branches are not permitted but the bank directories include one branch recently formed.

Prohibitory statutes generally except existing branches. Roughly speaking, branch banking is not permitted in two-thirds of the states.

Recent Legislation.—During 1925 New Jersey has passed a law authorizing banks and trust companies other than savings banks to establish branch offices or agencies in the same town, township, borough, or village and a separate law provides for branches of savings banks within the corporate limits of the municipality on the approval of the commissioner of banking and insurance, provided the bank has a surplus of not less than five per cent. of deposits and in addition $50,000 surplus for ea branch office.

In Tennessee where branches ha heretofore been permitted without e press statutory authority not limit to the same city or town, the legi lature in 1925 has enacted a la prohibiting branches of banks in an place whatsoever other than th county in which the bank does it business. This law, however, is mad applicable to branches that no maintain branches outside the count

The state of Idaho, wherein branc banking has heretofore been prohibited, has passed a further law thi year which provides that no ban shall maintain any branch bank, receive deposits or pay checks excep over the counter of and in its ow banking house with a proviso tha nothing in the law shall prohibit ordinary clearing house transactions between banks.

FOREIGN EXCHANGE

By Harold R. Bayley

Foreign Exchange Broker, New York

British Gold Standard.—The outstanding feature in Foreign Exchange 1925 was the return of Great Britain to a free gold basis, though the year witnessed many events of major importance. The general tendency of quotations reflected restored confidence and resumption of normal activities. Such improvement was due mainly to determined efforts toward restoring of closer balance between governmental expenditures and receipts and increased output of labor. Our purchase of securities of divers class and large loans to various states and industrial institutions gave great impetus to the movement.

The rapid adjustment to higher values and increasing restoration of parities brought to the fore the subject of resumption of gold payments and efforts on the part of forward looking statesmen to this end became the subject of heated debate. Broadly increasing improvement in general conditions both here and abroad, enabling us on the one hand to offer large financial aid to Europe and enabling Europe to restore her position in many respects to normalcy, eventually brought England to the goal of her endeavor and actual resumption of gold payments was announced April 28.

Sterling entered the year at 4.74⅞ for cable transfer with a definite upward trend. England, by courageous acceptance of burdensome taxes had balanced her budget and funded her war debt to us, thus inspiring world wide confidence in her ability soon to declare for a gold basis. Under the impetus of easy money here and higher rates at London vast balances were established there and large amounts placed in investments, the rate for the Pound mounted to 4.84½ in April when announcement of resumption of gold payments was made. In May the rate advanced to 4.86⅜ and large profit taking and drawing down of balances with signs of stiffening of interest rates here retarded further advance. An advance of the Bank of England rate from 4 per cent. to 5 per cent. in May held values at about 4.86 but increasing demands on credit here with huge requirements for Stock marketing purposes reflected their influence in bearing the quotion in October to 4.84 and making necessary the shipment to us of large sums of gold. Our purchases of remittances, in payment for the gold sent us, rapidly restored the rate to 4.84⅞ making further shipment of the precious metal unprofitable.

Holland.—Holland suffering fewer post-war difficulties saw the Guilder at .4054 at the opening of the year. From the beginning, fluctuations were never of a startling nature dropping no lower than .3984 in March, rising again in April to .4012 at which time the return to a basis of gold payment was announced, the declaration having been made simultaneously with that of the English Bank. Since April quotations have varied little, a market of great stability having carried through the balance of the year.

Scandinavia.—Sweden having long since effected a limited gold basis has stimulated little interest. Operations in exchange have been of limited nature and devoid of speculative flavor. The rate at the beginning of the year was .2697, just above gold parity and was steadily maintained with slight variation until April when a low of .2674 was recorded, in May a low of .2673 was followed by a rise in July to .2692. Quotations were only slightly changed through August and September. A slump followed in October to .2676 at which it remained throughout November.

Denmark and Norway presented a joint picture of lively interest. Conditions throughout were generally similar and the story of either is applicable to both. Norway at .1513 and Denmark at .1768 marked the opening of the year. With a tendency to rally occasionally and displaying marked nervousness, the quotation changed little through January and February. In March a strong tendency asserted itself and speculative interest was greatly roused. Exporters in both countries now began to sell their balances in New York and London which they had permitted to accumulate unaware of the fact they had grown to such unwieldly proportions. The machinery of foreign exchange was taxed to its utmost, the dollars resting here were suddenly wanted at home. Such demand, now become general and insistent, carried the rates to .1587 in March for Norway and .1836 for Denmark; April, .1653 Norway and .1872 Denmark. Soon talk of early return to a basis of gold payments became rife and return to par was expected and hoped for by eager speculators. Meanwhile the exporters at Oslo and Copenhagen were hard hit by the rise in the Krone at New York and (consequent) drop in the Dollar at home, and their State Banks now endeavored to stem the tide by buying Dollars at home, but the speculative fever carried on and June saw the rates at .1790 for Norway and .2019 for Denmark; the respective quotations for July touched .1885 and .2405 but profit taking carried them back to .1803 and .2200 at the close of the month. August witnessed a further advance to .2095 and .2501 and September .2242 and .2535; efforts to prevent further rise and stabilize the rates were now become effective. The too rapid advance had already caused much concern and a marked reaction in industry.

France.—Meanwhile France, torn between the forces of political exigency and personal as opposed to National interest, has floundered in a mire of financial and political blundering. Unlike other nations, politics has been one of the most important influences operating in its effect on Exchange. Shifting policies, changing cabinets, evasion of primary responsibilities regarding taxation and acknowledgment of external obligations has shattered confidence and resulted in sporadic flights from the Franc. Obligations of Treasury have pressed heavily on the Bank; maturing loans, due to unwillingness of public to reinvest, have been met only by recourse to issue of bank notes in increasing volume, making necessary the extension of legal limit of issue to unprecedented figures. The effect of such cumulative influences has left the Franc in a most deplorable condition and constituting the outstanding weak spot in the whole international group. The Franc opened the year at .0544—this rate also marking the high.

Credits effected in United States formed the only prop to the rate and proved effective at times in restoring some semblance of stability. Large buying of Dollars and Sterling reflecting the endeavor to find safe refuge from repeated threats of capital levies proved too heavy a strain and the Franc with occasional rallies slumped to .0376 in November.

Belgium at the beginning of the year was under the influence of the French Franc and suffered the resultant ills of France and her policies, or lack of such. By independent effort a debt settlement was effected with United States with the result the Belgian Franc parted company with the French and through credits arranged here the currency was stabilized. Her rate opened at .0498 and reached its high in the same month at .0522½. In June with exchange on Paris falling to .0449 the rate was depressed to .4445½. Hereafter little change was noted, the price closing at .0453½ in November.

Italy.—Notwithstanding a lack of natural resources, that great bulwark of financial strength, balanced her budget and faced her obligations with a united front. Her debt funding commission brought to a speedy conclusion the adjustment of her debt to the United States and large credits immediately followed, giving stability to her market and confidence in her ability to maintain rates. The Lira opened at .0422 the rate being fairly maintained above four (4) cents until March, when a low for the movement of .0398¾ was recorded with subsequent rally to .0412½. Steadiness prevailed with slight change through April and part of May, when a low of .0397 reflected a drooping tendency. In June the price slumped to .035 and July witnessed the low for the year of .0334½. August saw a recovery to .0377¼ and September a further rise to .0429 with later drop to .0406; hereafter the quotation remained relatively steady and the last for November was .0404½.

Japan.—The Yen at the opening of the year was .3860. Japan surmounted a difficult situation in her restorati program. The Earthquake shock ha reduced her productive capacity an occasioned additional need for fund The Government inaugurated a pr gram of economy, discouraging u necessary imports and lending effort to increasing exports. A drop to .38 in January was followed by a rise i February to .3990 and March set th figure close to .42 with subsequen reaction to .4138. Again advancin in April to high of .4220 and closin May at .4165. Suggestion of retur to gold parity strengthened the posi tion of the Yen and a real program t that end was semi-officially an nounced. In confirmation of govern ment intentions several shipments o gold were sent here with the express purpose of supporting Exchange With alternating rallies and reac tions a high of .435 was established in November and prospects o return to Gold basis seemed fair for 1926.

Germany.—German Exchange afforded little interest, merely a nominal market obtaining and transactions being in amounts of little consequence. The rate was 2380-2381 with only fractional deviation and business was in the nature of special operations.

Switzerland.—The Swiss Franc was steadily maintained all year, the rate averaging well above gold parity. Opening January at .1949 and establishing a high of .1950 in that month. Recording a low for the year in February at .1920. The rate was .1928 at end of November.

Spain.—Pesetas opened at .1399 and made a low mark for the year at .1397 in January, closing that month at .1432. There was slight variation during February and March but April saw the rate at .1465 and May .1473, the high for the year. The rate changed but little during the next five months and drooped in November to a close of .1418. An apparent tendency to rise during early months was halted by the resumption of large scale military operations in Morocco.

Canada experienced a year of general prosperity with crops close to previous high records. New York bought generously of Canadian securities and this together with large grain shipments brought her funds from a low of 7/16 discount in January to a high of 3/16 premium in October. The premium on the Canadian dollar made shipment of gold a more profitable operation than purchase of remittances, and large amounts of metal went over the border. These shipments offset largely our imports of gold from London and brought the rate back to parity. A later rally in November to 3/16 premium sent further shipments of gold North but the rally was short-lived and the rate subsequently dropped to 1/16 discount in December.

BANKING LEGISLATION

By Thomas B. Paton

General Counsel, American Bankers' Association

There has been a considerable variety of legislation affecting banks enacted during the year 1925, both by the States and by Congress. During the year forty-two State Legislatures held regular sessions and the short session of the Sixty-eighth Congress extended from December, 1924, to March 4, 1925.

Federal Statistics.—The United States Arbitration Act, approved by the President on Lincoln's birthday to take effect January 1, 1926, will have a farreaching beneficial effect in both the banking and commercial world. It makes valid and enforceable written provisions or agreements for arbitration of disputes arising out of contracts, maritime transactions or commerce among the states or territories or with foreign nations. Under this act and companion acts which have already been passed in New York and New Jersey and other states, the way is opened for the settlement of commercial disputes by arbitration in place of long delayed and expensive litigation. The American Bankers' Association is lending its influence to the furthering of similar acts in all the States.

Congress during the short session made a number of amendments to the Agricultural Credits and Federal Farm Loan Acts without fundamental change in the law. The Purnell bill which increases the appropriations for agricultural experiment stations, sponsored by the American Bankers' Association was also passed. An act directly affecting National banks, passed at the short session, authorizes the Comptroller of the Currency to destroy the oaths of directors of national banks after ten years from filing and disqualifies an officer of a director's bank to take the oath.

State Banking Laws.—In the field of state legislation there have been so many enactments that only a partial summary of an attempt to cover the subjects of more general interest can be made. In three of the States, Idaho, Oregon and Wyoming, new banking codes have been enacted. In Wyoming, the new banking law is practically the same as the old code except that it contains provisions for the State Examiner to act as receiver and for filing a lien against the property of stockholders immediately upon the closing of the bank, which lien continues in effect until the assessment is paid. In many of the states in recent years similar changes have been made by which the old and expensive liquidation through receivers appointed by the courts have been done away and the winding up of the affairs of an insolvent bank is placed in charge of the State Bank Commissioner or Superintendent, a much less expensive and more expeditious method. In Idaho and Oregon entirely new banking codes have been enacted. In Pennsylvania the work of revision and codification of the banking laws has been in charge of a Commission which has been continued by the Legislature for another period of two years. In Iowa a law has been passed creating a State Banking Board to advise with the Superintendent of Banks in the administration of all banking laws and in Kansas a banking board of five members has been created. In New Mexico a new State Banking Act drawn by the New Mexico Bankers' Association failed to pass.

Building and Loan Associations.—In New Jersey, a new law governing building and loan associations has been passed. The Utah Legislature has also passed an act relating to the organization, operation and supervision of building and loan associations, industrial loan companies and certain investment companies. In Montana a law has also been passed to create a Banking and Building and Loan Association Code Committee and prescribe its powers and duties.

Violent Crime.—Efforts by many State Legislatures to stem the rising tide of crime is indicated in a variety of legislative enactments. For example, in New Mexico, a bill has been passed making bank robbery punishable from five to ninety-nine years' imprisonment and embezzlement from a bank punishable from five to twenty years; in Indiana the bankers succeeded in having passed a "pistol-toting" bill increasing the penalty on gun-carrying.

Anti-fraud Acts.—Utah has passed a Blue Sky Law aimed to check the promotion of fraudulent securities and the Blue Sky Act of New York (the Martin Act) has been amended by a law which gives the Attorney-General jurisdiction over all commodities dealt in on exchanges, such as cotton, grain and sugar, his former supervision extending only to securities. The amendment also requires the publication of the names and addresses of all persons promoting stock issues and requires the filing with the Attorney-General of notice of such issues.

Investments.—In Kansas, State banks have been qualified to purchase Federal Farm Loan Bonds and such bonds have been made legal investments for trust funds in Ohio. Joint-stock land bank bonds have been made legal investments for trust funds in New Jersey.

Security Acts.—Sound banking has been furthered by enactments in some of the states increasing the minimum bank-capital requirements, limiting loans to officers and directors and enlarging the powers of supervising state officials. A number of states have enacted new provisions looking to increased safety of public funds deposited in banks and one state, Iowa, has taken public funds deposited in banks out of the preferred class.

Guaranty of Deposits.—Bills were introduced in several states for the guaranty of bank deposits but in every case were defeated. The disastrous experience of Oklahoma which has already repealed this legislation and of other states has done much to convince the public of the unsoundness of the theory of compulsory guaranty of bank deposits. This year South Dakota has repealed its guaranty law, subject to ratification of the bill by the people. In Kansas, the bank guaranty law has been amended to discontinue the payment of interest on existing and future certificates held by depositors of failed banks. In Nebraska the powers of the Guaranty Fund Commission have been enlarged and some defects discovered in two years' operation of the guaranty law have been corrected. The Guaranty Fund Commission is composed of seven state bankers elected from different parts of the State by the State bankers. This Commission has full power in the handling of banks taken over by the Department of Banking, and of the receiverships. The Guaranty Fund Commission may conduct such banks as going concerns for the purpose of liquidating the same or for the purpose of selling the bank as a going concern after the loss has been taken out of the bank through payment by the Guaranty Fund. In Texas, an important amendment to the Guaranty Law has been passed, permitting state banks to withdraw from the Guaranty Fund and become guaranty bond banks, with the approval of the Banking Commissioner who passes on the condition of the bank and passes on the bond furnished. Henceforward they will be required to furnish bond only in the amount of their capital stock regardless of the size of the banks' deposits. This bond can be a personal bond signed by the directors of the bank or it may be a surety bond.

Bank Taxes.—A number of states have amended the tax laws in their application to banks. In Kansas a money and credits tax of 2½ mills on intangibles has been established in lieu of all other taxes and a mortgage registration act has been passed which provides for a flat fee of 25 cents per $100 on real estate mortgages and exempts them from all other tax. In Vermont a new law has been passed relating to the taxation of intangibles, and in Utah a law has been passed amending the law relating to the assessment of bank stock by making the book value the basis of assessment with deduction of real estate.

Measures Recommended by the American Bankers' Association.—The following have been passed this year in states named:

Uniform Sales Act, Delaware and West Virginia;
Uniform Fiduciaries Act, Idaho and Utah;
Time Limit on Stop Payment, Idaho, Michigan, West Virginia and Wyoming;
Payment of Stale Check, Idaho, Kansas, Michigan and New Mexico;
Adverse Claim to Bank Deposit, Idaho, Kansas, Michigan, New Mexico, Oregon and West Virginia;
Payment of Deposits in Two Names, New Mexico and North Dakota;
Competency of Bank and Corporation Notaries, Oregon;
Nonpayment of Check through Error, Wyoming;
Saturday Afternoon Bank Transactions, Idaho and Rhode Island;
Forwarding Check Direct to Payor, Nebraska, North Dakota, Utah, West Virginia and Montana;
Amendments to Uniform Warehouse Receipts Act, Idaho;
Filing of Federal Tax Liens, Arizona, Idaho, Indiana, Maine, Nevada, Oklahoma, Tennessee and Washington;
False Statements for Credit, Texas;
Slander and Libel of Bank, Texas.

Modification of Association measures passed in earlier years have been made in the following states:

Payment of Forged and Raised Checks, Idaho and West Virginia;
Payment of Deposits in Two Names, Idaho and Rhode Island;
Payments of Deposits in Trust, Wyoming;
Checks or Drafts Without Funds, Delaware, Maine, Missouri, Nevada, North Carolina, Tennessee, Texas, Vermont and Wyoming;
Burglary with Explosives, Texas.

STATISTICS OF BANKING

By Gurden Edwards
American Bankers' Association

Comparative figures showing the condition of all banks in the United States, other than mutual savings banks and private banks not under State supervision, showed a continuous rise in loans and investments, which on June 30, 1925, reached a new record total of $41,561,000,000, an increase of $3,154,000,000 over the total for June of 1924. Total deposits, exclusive of banks' deposits, were $3,750,000,000 above the amount reported at the end of June, 1924. Borrowings from Federal reserve and other banks went up $140,000,000 between June, 1924, and June, 1925.

Loans, investments and deposits of mutual savings banks increased between June, 1924, and June, 1925, as follows: loans, $405,000,000; investments, $134,000,000, and deposits, $452,000,000. If the figures for the mutual savings banks are added to those for other banks, the total loans of all banks in the United States at the end of June, 1925, excepting private banks not under State supervision aggregated $33,569,000,000, and their investments $15,375,000,000, a total of $48,944,000,000, or $3,686,000,000 more than reported in June a year before.

The table below shows in summary form the amounts of loans, investments and deposits of all incorporated stock banks in the United States for recent dates since June, 1920.

DIVISION XVII
INSURANCE

LIFE INSURANCE

By Wendell M. Strong
Associate Actuary, Mutual Life Insurance Co., New York

General.—The year 1925, like each of its predecessors for many years past (with a single exception), shows a substantial gain in amount of life insurance issued and of insurance in force. The remarkable thing about life insurance is that while other kinds of business have their good and bad years, the record of life insurance is each year better than the past, the only fluctuations in recent years (with the exception of the amount of insurance issued in the year 1921), being in the amount of gains. The insurance issued in the first eleven months of 1925 shows an increase of over 20 per cent. over that of the corresponding period in the year 1924, while 1924 showed an increase of more than 10 per cent. over 1923. The statistics which are available on the basis of the experience of forty-five companies show, for the first eleven months of 1925, an increase over 1924 in ordinary insurance issued of 16.4 per cent., in industrial insurance issued of 22.9 per cent, and in group insurance issued of 65.5 per cent. The only adequate explanation of such continued and uninterrupted progress in life insurance would seem to be that it has more and more the confidence of the public and that there is a constantly increasing appreciation and understanding of its purposes and uses.

The magnitude of the business can, perhaps, be better appreciated if we consider that the amount of life insurance, including industrial and group insurance but excluding the government war risk and fraternal insurance, in force at the end of th year 1925, will be approximately seventy billion dollars and the asset of the companies will be somethin over eleven billion dollars.

The tremendous growth of the business may be realized in another way namely, by a comparison of the siz and business of the companies now with what they were six years ag early in the post-war period. The assets, the surplus, the amount of insurance in force, and the premium income have in that period all more than doubled.

Special Causes of Growth.—When we turn from the growth of the business as a whole to specific developments which have aided it, we find among them two which should be especially mentioned. The first of these is the remarkable increase in the use of the various optional settlements provided for under modern policies by which the company either retains the proceeds and pays interest during the life of the beneficiary, or pays the proceeds in instalments (allowing interest in so doing) or pays an income for life to the beneficiary. These optional settlements have been contained in policies for many years but have been little used. Recently the appreciation of their value by the insuring public has developed rapidly, with the result that a much larger use is now made of the opportunities that they offer. This increased knowledge, both on the part of agents and of the insured themselves, of the value and adaptibility of these options has undoubtedly resulted in an increased demand for insurance and a more adequate conception of the amount of insurance required in individual cases.

It is sometimes said that the original insurance insures the insured, while the special settlements insure the beneficiary. This is true to a great extent since it is unquestionably often the case that where settlement is made in a single sum the beneficiary loses in a short time, through lack of business knowledge and discretion, the proceeds of the insurance which the insured may have struggled year after year during his lifetime to maintain. The optional settlements meet this difficulty by furnishing an income in some form rather than a lump sum.

A second notable factor in the steady increase of life insurance business is a result of the heavy inheritance and estate taxes, both State and Federal, that now exist, and have existed for some years. Large estates have to pay in cash or its equivalent a very large amount of tax. Usually the estate consists only in small part of ready cash, while securities or property cannot readily be turned into cash without sacrifice. A life insurance policy frequently seems the best way to provide the cash to meet the demand that would be made on the estate for this purpose. While the same condition has existed for a number of years, we find that here again the appreciation of the peculiar suitability of life insurance for making such provision has increased, and has had a marked effect on the amount of life insurance written.

The increase of the business must, however, be ascribed in greater measure to other and still more important causes, namely, the increase in both the population and wealth of the country, and the increasing appreciation of what life insurance can do for dependents.

STATISTICS OF UNITED STATES LIFE INSURANCE COMPANIES

(Insurance Year Book)
(In millions)

Year	Number of Companies	End of Year		Premiums Received	Total Income	Total Payments to Policyholders	Total Disbursements	New Business	Amount in Force End of Year
		Admitted Assets	Surplus [1]						
1924	297	$10,394	$1,137	$2,122	$2,703	$1,205	$1,813	$14,077 [2]	$63,780 [2]
1923	291	9,455	1,077	1,896	2,424	1,089	1,680	12,070 [2]	56,904 [2]

Disability and Double Indemnity Benefits.—A development in connection with life insurance which began to assume importance more than ten years ago was the addition to life policies of benefits payable in event of the total and permanent disability of the insured, such benefits consisting of either waiver of premium or waiver of premium and income to the insured during such disability. Another feature is what is known as "double indemnity" (i.e., payment of double the face of the policy in case of accidental death). In recent years these special provisions have been included in the policies of nearly all companies, and probably the greater part of life insurance now issued includes one or both of them.

The inclusion of disability benefits in a life insurance policy provides an income and also keeps the policy in force without cost in case of total and permanent disability. This is a more complete protective policy than the forms which provided for life insurance only, which were the only forms available a few years ago.

In the absence of more reliable data, premiums for disability benefits have generally been based on tables made up from the earlier experience of fraternal orders. The experience of the insurance companies with these benefits, so far as it is now available, would indicate that the premiums charged for disability benefits should be increased, and this question has been, and is, one of the most important which must be considered very carefully by the companies in the near future.

During 1925 an investigation was undertaken under the auspices of the Actuarial Society of America into the question of the feasibility of constructing a new standard disability table to replace the present standard. At the date of writing, the results of the investigation have not been announced. It may be said, however, that owing to the rapid developments which have taken place in the various companies' practice relating to disability benefits, and to the short period for which homogeneous data is available it is doubtful whether it will be possible at the present time to prepare a satisfactory table on t basis of the companies' own expe ence. Doubtless, however, valuable i formation will be obtained which w be of use in the determination of su able premium rates and reserves.

The experience with the double i demnity benefit, which is usually co pled in thought with the disabili benefits although it is of an entire different nature, has been more favo able, the experience of the compani showing that the premiums original adopted are adequate.

Non-Medical Insurance.—A ve recent development in life insuran (at least on this continent) has be the issuance of policies of limit amount without medical examinatio This practice was first adopted by ce tain Canadian companies in the b ginning of 1921, and their experien has been so satisfactory that no practically all Canadian compani have adopted it. These companies i sue new insurance of $2,000, $3,00 and in the case of one or two companies $5,000, without medical e amination, usually also allowing add tional policies at annual interval sometimes for the same amount an sometimes for less amounts only. careful selection is made and the a plicant is required to answer a car fully drawn and thorough questio naire, covering all matters whic might affect his insurability. A number of American companies have no undertaken the issue of life polici without medical examination and i one company the limit is as high a $10,000. The chief advantages to th companies are reduction in expen and facility in the transaction of bus ness, particularly in rural distric where a long journey either by th applicant or the examiner might b necessary to make the examination.

The experience of the Canadia companies has thus far been un formly good, the indications bein that the saving in expense is great than any loss through accepting a fe cases which would have been weede out by medical examination.

Mortality.—With increasing lo gevity of the population at large, th difference between "expected" an "actual" mortality tends to increas

In recent years the mortality experience among insured lives has been very favorable. Indications are that, when the full results for 1925 are known, it will prove to have been the best year ever known to life insurance in this respect, with a lower percentage of "actual" to "expected" mortality than in any other year.

"American Men" Mortality Table.—Since its construction more than sixty years ago the American Experience Table has been in many ways a standard mortality table in use in this country for premium rates, and is now the standard for reserves in most of the states having statutes on this subject. Mortality rates have been gradually decreasing for many years, particularly at the younger ages, and the general experience has now become very much better than the rates shown by the American Experience Table. In consequence of this, and at the request of the State Insurance Commissioners, a new table known as the "American Men" Table was constructed some years ago under the supervision of the Actuarial Society of America and the American Institute of Actuaries. This table is based on the experience of the principal companies from 1900 to 1915. It shows a lower mortality at most ages than the American Experience Table, and much lower at the younger insurance ages. Shortly after the completion of the new table the influenza epidemics of 1918 and 1919 occurred with resulting high mortality among insured lives. In some cases the mortality for 1918 was actually higher than that "expected" by the American Experience Table. In consequence of this and for other reasons, the American Men Table was not adopted in any state as a reserve standard to take the place of the American Experience Table. There has been considerable discussion as to the adoption of the new table for life insurance purposes and in 1925 this question has been taken up again by the insurance authorities. A committee of actuaries of the state insurance departments has been appointed to coöperate with committees of company actuaries to make recommendations in this matter.

Notwithstanding the lower mortality rates a change would make very little difference in total reserves; in fact, use of the new table would increase reserves slightly rather than decrease them. On the other hand, the lower rates of mortality would make a very considerable difference in premium rates. In the case of companies issuing participating policies this is not of much importance since any overcharge or inequality of gross premium rates is adjusted in dividends. For companies issuing non-participating insurance the situation is different. If their premium rates are too high there is no readjustment afterwards. Some of these companies, particularly among the smaller ones, would prefer to keep the present standard since the artificially high rates are a help to them. Others, and among these the largest, would prefer to charge lower premiums at the younger ages than the American Experience net table but are unable to do so because the statutes of several States require a deficiency reserve to be added to the regular reserve when the premium charged is less than the net premium by the American Experience Table. Adoption of the new table would thus solve the problem for such companies and permit them to issue insurance at lower rates at the younger ages.

Payroll Deduction Insurance.—A form of life insurance which is in process of development and which seems to be extending quite rapidly is one which is known by various names, such, for instance, as "Payroll Deduction" or "Salary Allotment" insurance. The essential feature is that at the request of the insured premiums are withheld from his salary by his employer and paid by the employer monthly to the company. This has the advantages to the insured that premium payments are automatically taken care of, and that the cost is spread evenly over his income, instead of coming due in comparatively large amounts quarterly, semi-annually, or annually.

Miscellaneous Services. — A new field entered into by one large company is the taking over a pension plan for corporations in very much the same way as group insurance is issued to companies on the lives of employees.

It will be seen from the figures given elsewhere in this article that group insurance has been increasing at an extraordinary rate.

One of the important features the year is that dividends have be higher than in the previous year, a probably higher than ever before; other words, the net cost of insu ance to policy holders has been t lowest of all time.

FIRE INSURANCE

By E. R. Hardy

Assistant Manager, New York Fire Insurance Exchange

Many of the Fire Insurance companies, most of them in fact, are permitted under their charters to write Marine Insurance and it is difficult to separate completely the returns. Progress is being made in that direction, but is not yet sufficiently complete to be final. The lines normally written are Fire, Ocean Marine, Motor Vehicles, Inland Navigation, Tornado, Hail, Sprinkler Leakage, Riot, Rain, Earthquake, and Smoke Damage.

Fire Statistics.—The amount c Fire Insurance written at the preser time is approximately one hundre billions per year. This amount wi increase as the country grows. Th is the gross amount and the ne amount would probably be about 2 per cent. less. The underwriting r sults, as they are termed, are pr sented in the following form, whic is the accepted and required for for their presentation. [See tab on page 465.]

UNDERWRITING RESULTS

(Fire and Lightning Only.)

(1924 only.)

(1920-1924 incl.)

(Fire and Lightning Only.)

Premiums earned	....	$2,539,320,803	
Losses incurred	(57.75%)		$1,466,247,177
Expenses incurred	(46.02%)		1,168,679,360
	(103.77%)		
Deficit	(3.77%)	95,605,734	
	100.00%	$2,634,926,537	$2,634,926,537

Fire Waste.—Fire insurance is based on the amount of fire waste, at least it very closely follows that in its ups and downs.

The statistics, for the years from 1920 to 1924 inclusive, quoted below are considered the most authoritative that can be obtained.

	Population	Total Loss	Per Capita
1920—Whole country	106,418,175	* 447,886,677	4.21
370 cities	39,636,748	† 151,120,951	3.81
1921—Whole country	107,833,284	* 495,406,012	4.59
370 cities	40,324,918	† 141,406,007	3.51
1922—Whole country	109,248,393	* 506,541,001	4.63
366 cities	33,821,476	† 120,964,112	3.57
1923—Whole country	110,663,502	* 535,372,782	4.84
372 cities	42,946,639	† 147,102,119	3.42
1924—Whole country	112,078,611	* 548,810,639	4.90
366 cities	43,375,796	† 146,222,749	3.37

* Estimated from Records of the Actuarial Bureau.

† Actual figures reported.

Claims for Losses.—At the present time the claims for losses under fire policies are approaching the one million mark. As a rule there is a loss payment for every two claims. The changes through a series of years are shown by the following table:

Year	Reports Received	No. of Claims	Loss
1916......	750,000	361,742	$208,706,362
1917......	678,000	356,896	231,628,040
1918......	581,829	328,737	283,103,101
1919......	588,013	310,897	256,432,319
1920......	705,088	338,946	358,309,342
1921......	812,357	378,663	396,324,810
1922......	1,022,670	460,000	405,232,801
1923......	903,140	406,413	406,245,883
1924......	949,887	427,449	*439,048,511

* Estimated by comparing the complete records of the same twenty states for 1922 and 1923.

Through a period of sixty-five years the losses have averaged between 56 per cent. and 57 per cent. of premiums received. The figures for the earlier years are not as exact as those for the later ones, but the percentage named is quite near the mark. The most remarkable variations occur in the big conflagration years, as the year of the Chicago Fire, 1871, when losses ran up to 85 per cent. of the premiums and the year of the San Francisco Fire, 1904, when the losses to premiums approached 100 per cent.

Other Branches of Insurance.—The other lines of insurance, as they are usually called, written by this group of companies, have not in many cases been segregated from the fire and lightning end for many years. Therefore, no attempt is made to present these for a series of years, but for the latest available they are as fo lows:

	Risks Written	Premiums Received	Losses Paid
Ocean marine	$12,120,600,000	$37,800,000	$26,000,000
Motor vehicle	5,481,700,000	83,835,579	37,200,000
Inland navigation, etc.	33,085,300,000	27,100,000	14,600,000
Tornado, etc.	6,410,000,000	27,100,000	13,800,000
Hail	166,400,000	8,800,000	8,000,000
Sprinkler leakage	1,261,600,000	1,600,000	988,000
Riot, etc.	638,400,000	1,093,000	266,000
Rain, etc.	125,600,000	2,600,000	1,500,000

Statistics for the same year for the Mutual companies are taken from "Distribution by States of Fire Insurance" and show that they received net premiums of $67,000,000 and incurred net losses of $31,000,000, while the other lines which they wrote made their total premiums $83,000,000 and their total losses $38,000,000.

State Legislation.—There were no outstanding changes either in the form of state legislation or legal decisions. The only exception to this might be the case in the State of Kansas, affecting changes in rates. For many months testimony has been taken on this case and the report of the referee sustained the position of the companies. That case has been appealed to the Supreme Court of the United States and must await a final decision from that body.

State Departments.—The State Departments were not unduly active in connection with this group of companies. The tendency is steadily in the direction of a more rigid control of many phases, especially that of rate making, but this during the past year was merely a steady development in that direction and nothing peculiarly new.

Methods of Rating.—The methods of rating in all the lines written show no changes of any moment. So far as Fire Insurance is concerned, the methods involved are quite well developed and it would take some years before any large change, owing to the interests involved, could be made. The changes which affect automobile insurance did not deal primarily with the fire hazard. The latter has scarcely changed at all. The two outstanding features of the year were earthquake and smoke damage insurance.

Earthquake Insurance.—The in creased interest in and demand fo Earthquake Insurance has grown ou of the earthquake at Santa Barbara Cal. Fire Insurance itself owes it great growth very largely to wha might be called the commercial o economic demand for it as distin guished from the interest of the in dividual property owner in having that form of protection for his own good. When those who sold goods on credit began to demand policies o Fire Insurance, the business receive a great impetus. This is mentione because the same cause is now being brought into play in connection with Earthquake Insurance. In those parts of the world where earthquakes are more or less a feature some earthquake insurance has always been written, although the tendency has been to eliminate it as a cause of loss unless a substantially higher premium was paid. It was this elimination which made the insurance losses due to the great earthquake and fire in Japan, September, 1923, so light. Since the Santa Barbara earthquake, however, the demand for Earthquake Insurance from those who loaned money either on mortgage or in the form of credit has been accentuated to an intensive degree. The result has been in nearly all cases an insistence upon earthquake insurance as well as fire and other forms of insurance.

The difficulty with the writing of Earthquake Insurance is the difficulty of securing a sufficient spread to provide a volume of income and a distribution of losses so as to make it a safe undertaking for the insurance companies to handle. Earthquakes are more or less local and the demand for that type of insurance is therefore a local and not a national one. The result is that, while the liability in any specified territory is apt to be very heavy, the premium receipts in that limited territory are rather light in proportion. The final solution or method of writing Earthquake Insurance has not yet been evolved. There is a proposition that all of the companies doing business in the United States form a bureau and each take a portion of every earthquake line that is written. In this way there would be secured a distribution of liability and of course of the premium. It is going to be extremely difficult even if the utmost caution is used for individual companies to write a large amount of Earthquake Insurance where the writing of that form of insurance is confined only to localities known to be subject to that kind of disaster.

Smoke Damage.—The origin of Smoke Damage Insurance, as it is being accentuated at the present time, arises from the introduction of fuel oil equipments. The question of Smoke Damage Insurance arose in connection with policies of Fire Insurance, because under the decisions of the courts a mere damage by smoke, as a smoking lamp, is not a claim under a fire policy. In the case of a fuel oil equipment the device may go wrong and a serious damage be done to the property but wholly by smoke, that is, without that degree of fire termed a "glow" which the courts have decided is necessary in order to establish a claim under a policy of Fire Insurance. The attempt to draw a suitable form to cover this type of loss has not yet been solved. One that is being used to some extent is here reproduced merely as an illustration:

In consideration of $........ additional premium this policy also covers direct loss or damage to the property insured caused by smoke from the operation of a fuel oil-burning apparatus on the described premises (when the use of said apparatus is permitted by this policy and the installation is in full compliance with such permit) whether fire ensues or not, for an amount not to exceed the sum insured, nor the interest of the insured in the property, and subject, in all respects, to the terms and conditions of this policy. Provided, however, if there shall be any other insurance on said property, this company shall be liable under this policy only pro rata with such other insurance for any direct loss by smoke from the operation of such fuel-oil apparatus whether such other insurance be against direct loss by smoke from operation of fuel-oil apparatus or not.

The difficulty with the smoke damage form of loss is not that, as in the case of fire, it may be a definite specific loss which can be located; that is, a sudden outburst which leaves no question as to a damage having been done, but in many cases there is a possibility of an injury done to the property arising from a fuel oil equipment which may injure property not by a sudden outburst but by a gradual discoloration, as of the wallpaper, because of this type of heating. There still remains some question as to whether proposed forms do not cover this type of loss as well as the positive outbreak form of loss. The gradual loss may be compared to an occupational disease in Workmen's Compensation as distinguished from an accident which occurs in a moment and leaves an injury of which there is no doubt.

Concentrated Insurance.—One other development during the year, perhaps as indicative of a tendency in Fire Insurance, is what is known as Concentrated Insurance. Thus a policy has been issued covering all the dairy business in New Zealand. It is placed through a limited number of offices and few policies have to be written in connection therewith, although the actual companies that issue policies do of course protect themselves by reinsurance. It will readily be seen that if this form should prove to be practical in a few cases, there would be an effort to extend it in many others, as has happened in connection with Life Insurance where the group method is being developed very rapidly.

MARINE INSURANCE

By Douglas F. Cox
President, U. S. Merchants' and Shippers' Insurance Co.

War Business.—The history of marine insurance during the past ten years, in common with that of other kinds of business, has been greatly affected by the world war and the events which followed in its train. In consequence of the demand for insurance against the risks of war on the enormous values of the hulls of vessels at that time and of the cargoes which they carried, marine insurance came suddenly into great prominence in this country. Attracted by the high rates and large volume of premium, many fire insurance companies which had theretofore taken little or no interest in the business appeared prominently in the market. A number of smaller companies were also formed at that time for the purpose of getting a share of the marine business.

In spite of the enormous losses which were incurred through the action of the German submarines, the war-risk business proved generally profitable and the companies prospered accordingly.

Post-War Business. — After the close of the war, when the values of vessels steadily decreased and the merchandise carried by them also decreased in volume and value, the market found itself in a very unfortunate position. The companies interested in the business were not only much more numerous than ever before, but were accustomed to years of large volume of premium and handsome profits. Being now confronted with a steady contraction of the volume of premium obtainable, a period of fierce competition ensued and has continued up to the present time. The underwriters in charge of some of the newer offices were comparatively inexperienced and in the struggle to maintain the premium volume, rates have been reduced far below the point of adequacy, and conditions more and more favorable to the assured have been added to the policies, which bring in a constant stream of losses arising from causes which in forme years would not have been though possible to cover by marine insuranc

Many of the smaller companies organized during the war have gone ou of business and a number of the fir companies have ceased writing marine; but some of the larger ones hav continued their operations on a larg scale and seem determined to continu to do the business at whatever rate may be necessary to obtain it. On company which in 1914 did a ver moderate amount of marine insurance wrote in 1924 over $8,000,000 of tha class, this figure being $3,000,00 more than any other company.

International Transaction.—Marin insurance is essentially internationa in character since, through the aid o brokers with connections in London, i is practically just as convenient fo the American owner of a fleet of vessels to insure in the London marke as in this or the shipper of merchandise may arrange to have it insured by the consignee in Europ with companies there just as conveniently as he can arrange to place the insurance here. This being the case, rates and conditions in this market are always dependent in a great measure on rates and conditions in the London market, which is the world center for this class of insurance; unfortunately, during the years since the war, the situation in London has been the same as here, if not worse, and the senseless reduction of rates year after year has gone on there in the same way.

Returns.—It is practically impossile to obtain satisfactory figures in regard to the results of marine insurance, for the reason that very few companies place marine risks only, and in the published statements, the marine figures have been combined with the fire figures and figures of the automobile business, so that it has been impossible to properly separate them. In very recent years the annual statements have shown a division of the receipts to some extent, but in the matter of expenses it is still impossible to separate them. The figures of the Atlantic Mutual Insurance Company, which is the oldest marine insurance company in this country and does a gross business of over $2,000,000, are usually left out of any tabulations; as the returns which it makes to its policy holders on a large part of its business so complicate their statements that it is impossible to compare their figures with those of other companies.

Little of the business done in this country is taken by companies which are not entered in the State of New York; hence the *Annual Report* of the New York Insurance Department practically covers the situation. In 1914 only seventy companies reported any business to the New York Department under the head of "Marine and Inland" the total premiums being $34,000,000. In 1919 one hundred and fifty companies reported business of that class to the New York Department, the total premiums being $135,000,000.00.

In 1924 there were one hundred and twenty-nine companies which reported business to the New York Department under the heads of "Ocean Marine" and "Inland Marine"—the total premium amounted to $69,000,000.00, with losses paid of $44,000,000.00—the losses incurred being about $42,000,000.00. Of these companies, forty-six wrote premium in this class of less than $100,000.00 each, fifty wrote premium of between $100,000.00 and $500,000.00, seventeen wrote between $500,000.00 and $1,000,000.00 and sixteen wrote over $1,000,000.00 each. The sixteen largest incomes amounted together to $42,900,000.00—the largest individual income being $8,600,000.00 and the two next largest $5,700,000.00 respectively. These sixteen companies therefore controlled about sixty per cent of the business.

Tabulation.—In tabulated form, these figures are interesting:—

	1914	1919	1924
Under $100,000		27	46
$100,000 to $500,000		51	50
$500,000 to $1,000,000.........		30	17
Over $1,000,000		42	16
	70	150	129
Total premium	$24,000,000	$135,000,000	$69,000,000

This shows the large increase in the number of companies between 1914 and 1919 in spite of the elimination of the German companies and the comparatively small decrease in the number of companies and the large decrease in the volume of premium between 1919 and 1924. It also shows the large increase in the number of companies doing less than $100,000—as a matter of fact, many of them are doing a very small amount.

It is also an interesting fact that the sixteen companies writing over a million each in 1924, their aggregate premium being 60 per cent. of the total, wrote only 38 per cent. of the total in 1919. Six of these wrote 36 per cent of the total in 1924, although they only wrote 16 per cent. in 1919. Three of them have increased their aggregate premium by $4,800,000 and one has increased from $4,800,000 in 1919 to $8,600,000 in 1924, and this is in spite of the large decrease in the total. This shows that as a result of the fierce competition since the war, an increasingly larger proportion of the business has been going to a few companies; and it is a natural assumption that those companies have been the most liberal in the matter of rates and conditions.

Hull or Cargo Insurance.—It is generally conceded that the ocean marine experience of the companies was, with some few exceptions, unprofitable in 1924 and it is also generally conceded that the experience of 1925 will be more so; this is true of the London as well as the New

York market. As to the future, the one encouraging sign is that the leading underwriters in the London market have at last come together in an effort to increase the rates on the hull business, which, if successful, might logically lead to a similar effort later on to increase the rates on cargoes. There seems to be no doubt that the American market will heartily support any advance whicl London is able to make in the hull rates, but as to the rates on cargoes no signs of coöperation for a rise have appeared in this market as yet. The cargo business is the backbone of the ocean marine here, and the future of the business depends upon whether the companies referred to above, as apparently determined to obtain business at any price, adhere to that attitude or evince a disposition to join with the other companies in an attempt to increase the rates.

Marine Insurance Syndicates.—An important occurrence of recent years is the establishment of the American Marine Insurance Syndicates. Th were formed in 1920 under pressu from the United States Governme which was determined that a mo satisfactory market should be esta lished in America for the insuran of the hulls of American vessels. response to this pressure, practical all the companies doing marine bus ness here became subscribers to t Syndicate organization; and sin that time practically all of the Ame ican hull business has been place with the Underwriter for the organ zation, acting under the advice Committees. This arrangement e ables the American market to spea with one voice in dealing with t brokers and to take advantage of an possible improvements in rates. T organization is generally considere to be a very valuable piece of ma chinery and to constitute the onl method by which the hull busines can be conducted in this countr with any hope of profit to the com panies generally.

CASUALTY INSURANCE

By A. Duncan Reid

President, Globe Indemnity Company

Regulation of Companies.—The most important occurrence in this field during 1925 was the requirement of the New York Insurance Department that a special exhibit be filed by all casualty companies showing "Acquisition & Field Supervision Cost by lines of Insurance," and also showing how fully the rules of the "Acquisition Cost Conference" had been complied with. These rules, framed and adopted in the closing weeks of 1922 by the casualty companies at the instance of the New York Superintendent of Insurance, had been approved by the National Convention of Insurance Commissioners but had not since been the subject of official inquiry. The rules were designed to limit the cost of acquiring all casualty insurance (excluding accident and health and fidelity and surety) to a basis fair alike to the public and to the companies' field representatives responsible fo business production. The effect o this requirement of a special exhibit was not only to induce earlier compliance with the "Acquisition Cost Rules," but principally to establish for the first time, what may be called "cost-accounting for casualty insurance" as a permanent part of the accounting procedure of the companies.

State Action.—No new states accepted the Workmen's Compensation principle during the year, although in Missouri a statute which was to have been effective September first was suspended by a referendum to popular vote at an election to be held in November, 1926. No sweeping changes in compensation rates were made effective during the year, although in Illinois rates were increased 6.1 per cent. on all policies existing as well as new and renewal, on account of a material increase in benefits under the Compensation Law, effective July first. Elsewhere it was felt that rate changes made in 1924 were sufficient to take care of statutory and other changes in conditions during 1925.

Compulsory automobile insurance continued to be agitated for, but only in the State of Massachusetts was legislation enacted, affecting an entire state. The Massachusetts statute does not become effective until January 1, 1927. Meanwhile, a legislative commission is investigating rates to be approved for such insurance.

Plate glass insurance will be affected for some time by the formation of a plate glass department of the National Bureau of Casualty & Surety Underwriters. "Standard" plate glass rates have been made for some time by W. F. Moore on behalf of nearly all companies writing this line. The "National Bureau," in taking over plate glass rating for a number of its members, merely extends to this class its practice and methods developed in rating of automobile and various other liability lines.

Miscellaneous liability insurance developed nothing new during the year, but the writing of the coverage for manufacturers, distributors and merchants known as Products Liability Insurance, was greatly extended. The demand for this coverage, as well as for Miscellaneous Property Damage Insurance, has grown very rapidly in the past few years. Contingent automobile insurance is another recent development in increasing demand.

Growth.—The remarkable growth of the casualty, surety and miscellaneous insurance business in the United States was continued during 1924. The total premiums written by all stock and mutual companies reached a total of $616,705,881, according to Best's Insurance Reports. The increase for the year over the preceding period was $80,000,000 in round numbers, or a gain of 15 per cent. When this figure is compared with a total of only a little over $350,000,000 in the year 1919, it will be seen that this youngest group of insurance lines is rapidly assuming giant proportions.

This growth has not been confined to any one class. Accident and health insurance has increased over 40 per cent in the last five years; plate glass has grown from less than $8,000,000 annual income to over $17,000,000; workmen's compensation has increased by over 60 per cent.; burglary and theft has grown from about $8,000,000 to over $26,000,000; liability insurance, including automobile, has more than doubled in volume; fidelity and surety premiums have nearly trebled during this period; even steam-boiler insurance, thought to be a diminishing class, has increased nearly 50 per cent.

Profits and Losses.—With this growth of volume has not come a corresponding improvement in underwriting profit, however. The year 1924 was the worst in twenty years in point of percentage of underwriting loss, according to the Insurance Year Book. One hundred companies, who wrote all but a small part of the total volume of this business, showed an underwriting loss of 2.4 per cent on premiums earned of $542,390,703. Of this number, sixty-three multiple line companies writing nearly all classes, totalling $446,171,621 of earned premiums, suffered a loss of 3.5 per cent.

Twenty-five of the one hundred companies confined themselves almost entirely to accident and health insurance and showed a profit of 3.9 per cent. on earned premiums of $49,625,685. Of this group only six companies failed to make some underwriting profit, but of the sixty-three multiple line companies mentioned above, only seventeen showed a gain while forty-six made underwriting losses.

The result of the underwriting of these one hundred companies covering the decade 1915-1924, was a profit of four-tenths of one per cent., with the multiple line companies showing a loss of one-tenth of one per cent. during that period. It is obvious that were it not for the investment profit earned by these companies, they could not survive.

Volume of Business.—The following table indicates the volume of business done by all companies in 1924, as compiled by Best's Insurance Reports. Attention is called to the fact that the loss ratios are for losses paid to premiums written. Ratios of incurred losses to premiums earned are not available for all companies, as all but a few State Insurance Departments require statements on the basis of premiums written and losses paid. The premiums-earned, losses-incurred bas is far more truly indicative of r sults in these classes of insuranc because the usually large increas in income, and the large proportio of losses which have been incurre but are not payable at date of r port, tend to obscure the true facts However, the total loss ratio as give below—53.1 per cent.—compare closely to the earned premium los ratio—53.2 per cent.—of one hun dred leading companies.

Class of Business	1924			1923		
	(1)	(2)	(3)	(1)	(2)	(3)
Accident and health	$109,829	47.9%	119	$ 95,141	49.6%	96
Auto and teams, property damage and collision	49,646	57.1%	86	38,196	59.0%	72
Burglary and theft	26,749	49.0%	53	24,538	43.1%	47
Check alteration	28	3.0%	2	28	1.7%	3
Credit	4,240	36.7%	5	3,768	27.8%	4
Engine and flywheel	2,748	32.2%	22	2,919	27.8%	17
Fidelity and surety	83,237	41.4%	57	74,121	37.9%	57
Liability	151,660	49.1%	83	132,268	47.3%	84
Livestock	1,274	64.6%	4	1,028	71.2%	4
Plate glass	17,217	36.4%	59	15,975	42.1%	47
Sprinkler	837	48.8%	4	854	43.0%	4
Steam boiler	6,463	16.7%	26	6,146	14.2%	24
Workmen's compensation	162,409	69.7%	94	140,856	71.2%	87
Workmen's collective	260	40.2%	5	201	53.7%	6
Totals	$616,706	53.1%		$536,040	52.6%	

Column 1—Premiums written in thousands of dollars.
Column 2—Ratio of loss and loss expense paid to premiums written.
Column 3—Number of companies reported on.

Fidelity and Surety Bonds.—The outstanding features of the year were the continued increase in this class of insurance and the increase in the wave of crime which, sweeping over the country, reflected itself in the Fidelity losses of the Companies, such losses reaching their peak in this year. Losses through bank failures were heavy on Depository Bonds throughout the year due to the upheaval in banking conditions throughout the western sections of the country during the two years preceding.

Fidelity premiums written in 1924 exceeded the sum of thirty million dollars which means an ever increasing number of employers requiring this form of protection, and that it is needed is evidenced by the fact that they were paid losses of over eleven millions.

Surety business kept apace in the increase, the total premiums being well over forty-eight million dollars on which twenty million dollars in losses were paid.

There was a decided movement for improving the underwriting of these vast lines by the creation of a "Committee for Better Underwriting" which has ably functioned. Also, contractors, acting through their Associations, and the Surety Companies reached a much clearer understanding of the others' needs, in this manner creating factors for future good results.

DIVISION XVIII
AGRICULTURE AND FISHERIES

CONDITIONS OF AGRICULTURE

By William Marion Jardine
United States Secretary of Agriculture

Production.—Farm production in the United States was somewhat smaller during the crop year 1925-26 than in the preceding crop year. Advancing farm commodity prices, however, promised to offset the effect on farm incomes of the decreased production. It is estimated that the gross income from agricultural production for the year will be slightly more than in the crop year 1924-25, and considerably larger than in any of the three preceding crop years. There were marked differences in agricultural prosperity as between States. As between crops, however, production was fairly well balanced. There was no large surplus of any important crop, and of few products was there a marked scarcity. In most parts of the country progress was made toward normal conditions. In recent years the general trend of American crop production has been upward. There are no indications that this trend will not be continued. The high prices now paid for some crops may bring about a material increase in the acreage planted for the next harvest.

In the great area from northern South Dakota to the Rio Grande and west of the Rockies drouth seriously reduced yields in the crop season of 1925. Damage from drouth was also serious in the area extending from the Ohio to the Potomac Rivers southeast to central Georgia and east to the Atlantic. In parts of these areas there was much distress among farmers. Altogether, 15 States were hard hit by drouth. Elsewhere crop yields were good but did not quite offset the reduction in the stricken areas. Yields for the country as a whole averaged slightly below the average during the last 10 years. Pastures were poor, particularly in the butter-producing States. Fewer hogs were available for market. It was noticed that the relative scarcity of certain crops brought about a fuller utilization of them than usual. Fewer apples rotted under the trees, and a larger proportion of the potato crop was used for human food.

Cotton.—Cotton production was estimated at approximately 15,386,000 bales. This production ranks with the crops of 1911 and 1914 as one of the three largest on record.

Wheat.—Wheat production of all varieties was in the neighborhood of nearly 700,000,000 bushels, or 175,000,000 bushels less than in the preceding year. The crop was the smallest since 1917, and in proportion t population the smallest since 1890. A fairly large acreage of winter wheat was planted but the area killed by unfavorable weather conditions amounted to nearly 10,000,000 acres, or 22.5 per cent. of the area sown. This was the heaviest abandonment on record, with the exception of that of 1917. The yield of winter wheat per acre averaged only 12.7 bushels, the lowest since 1914. Spring wheat production was 13.3 bushels per acre, about one bushel per acre above the average of the last five years, but 2.6 bushels per acre below the large yield of 1924. To some extent the reduction in the yield of spring wheat was offset by a large increase in the acreage planted to that variety in the Pacific Northwestern States, where spring wheat was substituted for winter wheat killed by frost.

Corn.—A corn crop of 3,013,000,000 bushels, nearly one-fourth larger than that of 1924 and of much better quality, was harvested. This production, however, was less than the average amount harvested the preceding four years. Excellent yields were obtained in the central portions of the Corn Belt and practically everywhere north of the Ohio and Potomac Rivers. Corn in the Southwest, however, was nearly a failure. A total of 1,470,000,000 bushels of oats, and 226,000,000 bushels of barley was harvested. These yields were just about enough above the average of recent years to balance our increasing population. The flaxseed crop of 22,000,000 bushels was much below the quantity harvested last year. There were sharp reductions in both acreage and yields of flax. Nevertheless, the crop was nearly double the average flax production during the 10 years previous to 1924. The hay crop of 1925 was only 98,000,000 tons, the smallest since 1918.

Buckwheat.—Buckwheat was also a good crop, and rice production not far below the usual average. Yields of rye, sugar beets and clover seed were low, as also were yields of sorghum for syrup and broomcorn. The apple crop was the smallest since 1921. Citrus fruits yielded fairly well. The potato crop of 346,500,000 bushels was the smallest since 1919. The sweet potato crop amounted to only 81,100,000 bushels, and was the smallest crop since 1916 with the exception of that of last year.

Prices. — Calculations based on present farm commodity prices indicate that the gross income of agriculture for the crop year 1925-26 will be somewhat in excess of $12,000,000,000. This income is considerably greater than that of the depression period of 1921-22, but is below that of 1919-20. There is no continuation this year of the rate of improvement in farm incomes that was established during 1922-23, 1923-24 and 1924-25 Price changes, however may affect th forecast.

Farmers received better prices fo their products in the 1925-26 cro year than at any time during the las five years. In August the purchasin power of the prices of farm product as expressed in terms of prices o non-agricultural products stood at 93 compared with 66 in 1921. This wa the nearest approach made since th depression to the pre-war parity between agricultural and industria commodity prices. In September however, the purchasing power index dropped 5 points to 88, and price movements during October and November indicated the possibility of further recessions. It was thus evident that the general condition o agriculture had not been restored to normal strength. Large crops of corn and oats had started the prices of those commodities downward. On the other hand, the outlook in the livestock industry was more favorable than it had been for several years. A reduced supply of pork had improved the market for both beef and mutton, and prospects in the dairy industry were favorable toward the close of the year.

Cotton Crop.—Conditions in the Cotton Belt were satisfactory except in south central Texas and the Piedmont areas of South Carolina and Georgia. More than 46,000,000 acres were planted to cotton in the spring of 1925. This was the largest acreage in the history of the country. The increase was greatest in the extreme western part of the Cotton Belt, where large areas of range land have been broken up and devoted to cotton in recent years. Growing conditions were less uniformly good for cotton than in the previous year but were extraordinarily favorable in many sections, with the result that the third largest cotton crop in the country's history was picked.

Nevertheless, this crop was not excessive in the light of market requirements. The year ended July 31, 1925, had left the world in perhaps the best balanced condition as between cotton supplies and consumption that had existed since the war. Our increased production of cotton was accompanied by recovery of the power to consume cotton in Europe. This was attested by the exports from the 1924 crop, which were over one-third larger than the average for the preceding five years, and by exports for the first months of 1925, exceeding even those of the corresponding period of 1924. Domestic business conditions likewise improved and brought about sharply increased mill consumption of cotton as the year advanced. In September the purchasing power of cotton in terms of other commodities was 12 per cent. above the average for the five years preceding September, 1914. Although this figure represented a reduction from the purchasing power of cotton in 1923-24 it nevertheless compared very favorably with that of other crops grown in the South.

Wheat Crop.—Our wheat situation at the close of 1925 was very different from that existing a year previously. With a large world crop, the United States had only a little more than enough wheat to meet domestic requirements. The wheat crop of the Northern Hemisphere, outside of Russia and China, was estimated as nearly 9 per cent. greater than the 1924 crop. It was larger than the pre-war average production in the same countries. Russia was reported to have considerable wheat for export. Prospects were good for the wheat crop of the Southern Hemisphere. The world's rye crop also was much larger than that of last year.

In spite of these circumstances the wheat price situation in the United States remained favorable. The shortage in supplies of several classes of wheat indicated that the country would be on an import basis at least for the greater part of the crop year. Anticipating this situation, the wheat markets recorded prices of wheat for December delivery in Chicago, Minneapolis and Kansas City approximately on a par with the price in Liverpool and considerably higher than in Winnipeg. There was every prospect that as high grade milling wheat became scarcer in the United States the margin between the domestic and foreign price of wheat would widen to the extent of encouraging imports.

This situation prompted the farmers to plan a large increase in their wheat acreage. The doubtful wisdom of this course was pointed out by the United States Department of Agriculture. Even with the same acreage of wheat as that sown in 1924, a good average yield would place the United States on an export basis for most if not all classes of wheat. As the trend of production in competing countries is sharply upward, it is obvious that largely increased acreage in the United States cannot be sown without danger of producing a burdensome surplus. Only poor crops in foreign wheat producing countries can result in a situation like that of 1924-25, when the farmers of the United States had a large crop which they were able to sell at high prices. The wheat producing area of Argentina, Canada and the United States is now 53 per cent. above the pre-war average. These countries have not yet reached their limit of wheat production. In view of their advantage over our farmers in the matter of production costs, it seems highly desirable that our wheat acreage should not be largely expanded.

Livestock. — Livestock producers found themselves in a generally favorable position in 1925. Hogs averaged more than 60 per cent. higher in price than during the first half of 1924. At times they brought nearly double the 1924 prices. Cattle sold at the highest prices registered since 1920, and the average price for lambs in August was $1.50 a hundred pounds higher than in 1924. Lessened supplies were probably responsible for the advance in hog prices, yet the supplies were not reduced in the same proportion as the prices increased. Marketings of cattle, hogs and sheep were heavier during the first half of 1925 than in the corresponding period of 1924. The most gratifying feature of the livestock situation was the advance in cattle prices. Depression in the livestock industry had been more severe than in perhaps any other branch of agriculture, and cattlemen had begun to wonder whether the turn in the road would ever come in sight. They had the gratification toward the close of 1925 of seeing cattle prices advance in spite of increased marketing probably because the proportion of the beef cattle in the country was known to be decreasing.

In the sheep industry favorable conditions prevailed as they had done since 1923. It seemed advisable, as the year closed, for sheep men to bear in mind the tendency of their business to go from one extreme of production to the other. Inexperienced sheep raisers were being attracted into it by its prosperity. Prudence in expanding the number of sheep on farms and ranches seemed necessary.

Financial Position.—Good crops and increased prices effected a great improvement in the financial position of our farmers in 1925 and satisfactory liquidation of debt took place during the year in most areas. Large numbers of farmers were still in financial difficulties, however, particularly in regions where commitments for high-priced land reached large proportions in the post-war boom years. In the range cattle country likewise, there was a considerable amount of debt remaining from the depression period.

Numerous bank failures in the last few years have complicated the farm credit situation in certain areas. These areas suffered last year from impaired confidence in the banking situation. Some of their solvent banks deemed it necessary to maintain extremely large cash resources. Accordingly, they invested heavily in Government obligations and other gilt-edge securities. In some districts the proportion of bank deposits represented by cash or Government obligations amounted to 75 per cent of the total. Fifty per cent. was not at all an uncommon proportion. Such a use of bank resources was obviously not calculated to make credit conditions particularly easy for the farmer. The restoration of confidence in agriculture as well as in the banking situation seemed essential to the reassumption of agricultural progress in these regions.

The intermediate credit banks established under the agricultural credits act of 1923 have assumed consi erable importance, particularly i financing farmers' coöperative ass ciations. There is reason to believ they will fill an equally importan place in financing the individua farmer where local capital is inade quate or where interest rates ar high. It is true, nevertheless, tha the rediscount facilities of the inter mediate credit bank system wer utilized in most areas last year onl to a limited extent. Much remain to be done to make them fully effec tive and to bring them within th reach of the individual farmer.

Agricultural Exports.—Foreign de mand for American agricultural prod ucts was better in 1925 than it ha been at any time since 1921. Th United States exported a large sur plus of wheat and cotton at goo prices. Other products were also ex ported in large volume. The quantit of our agricultural exports for th year ended June 30, 1925, was 21 per cent. greater than in the previous year, and 26 per cent. greater than the average for the five years preceding the outbreak of the World War. In value our exports last year were more than double those of any previous year and greater than those of any year since 1921.

Foreign competition is increasing in some branches of agriculture, notably wheat production. Dairy production continues to expand in the Southern Hemisphere. Nevertheless, the outlook for our export trade in farm products is favorable in the main. This country will no doubt be the world's chief source of supply for cotton for a long time. It is likewise the largest exporter of pork products. Production of cotton outside of the United States has increased rapidly in the last two seasons. As yet, however, our position in the world's cotton market is secure. Our resources for the production of corn, the best hog feed, seem to promise a continuance of our strong position in the export trade in pork products. The recent improvement in foreign purchasing power is a beneficial influence in our agricultural export trade generally.

We shall not be dependent on forgn markets for the disposal of as rge a part of our supply of agricul- ral products this year as we were . 1925. It has already been men- oned that we have only a small mount of wheat for export. Our ports of cotton may not be reduced, it pork and lard exports will cer- inly be low in view of the decline the number of hogs on farms. ur exports of tobacco, apples and her minor items may be about the me as last year. It is possible at the trend of our agricultural ex- ort trade will be downward in the ext decade or so. A downward end existed in the 15 years before e war, as the result largely of the ct that our industrial population as increasing more rapidly than our roduction of certain farm crops. Our creased agricultural exports last ar do not necessarily mean that is cause of declining agricultural xports will not be effective again the near future.

Summary.—Compared with the situation that existed in 1921, American agricultural conditions last year were encouraging. Nevertheless, they were by no means wholly satisfactory. I have referred to the fact that the purchasing power of farm commodities in September was still 12 per cent. below the pre-war level. Such a disparity between the buying power of farm products and that of other goods, if it occurred suddenly in normal times, would be recognized as a calamity. Our disposition now is rather to look on it as a measure of the recovery agriculture has made from the depression of 1921, when the farm commodity purchasing power index dropped to the low point of 66. It is important to bear in mind, when we congratulate ourselves on the improvement that has been achieved in the farmer's position during the last few years, that a prosperous agriculture requires nothing less than an equality of relative buying power with other economic enterprises.

PRODUCTION OF GRAIN CROPS

By W. F. Callander

Chairman, Crop Reporting Board, Department of Agriculture

INCREASE

The combined production of grain ops in the United States for 1925 as nearly 8 per cent. larger than for 924, while the gross value based on ecember 1 farm prices decreased 14 r cent., according to the December timates of the Crop Reporting oard of the United States Depart- ent of Agriculture, issued December , 1925. The 1925 production is out equal to the five-year average 1920-1924. The table on page 479 ves a comparison of the produc- on of important grain crops in the nited States for 1925, 1924, and the ve-year average from 1920-1924.

CROPS

Corn.—The 1925 corn crop of 2,901,- 00,000 bushels was 25 per cent. rger than the 1924 crop of 2,313,- 00,000 bushels and about equal to e five-year average of 1920-1924. he December 1 gross value of the 1925 corn crop, however, was 14 per cent. below that of the 1924 crop. While the corn of the central States had an unusually high moisture content at husking time, the quality on November 1, 1925, was reported at 83.6 per cent. of normal for the United States, as compared with 63.2 per cent. a year ago and 81.2 per cent. as the ten-year average.

The acreage of corn harvested in 1924, 101,076,000 acres, was considerably less than the acreage planted because of heavy abandonment due to unusually wet weather during June and July. In 1925 there was no such abandonment and the acreage harvested was 101,631,000 acres. The yield of corn per acre of 28.5 bushels in 1925 was nearly 15 per cent. above the 1924 yield of 22.9 bushels, and over a bushel higher than the ten-year average of 27.4 bushels.

The Central States, from Iowa to Pennsylvania, produced one of the largest corn crops on record, but many of the Southern States produced less corn than usual. The corn yields per acre in 1925 were exceptionally high in some of the Central States. The yield of corn in Ohio was 48 bushels per acre, as compared with the ten-year average yield of 38 bushels; Indiana, 43.5 bushels as compared with 35.5 bushels; Illinois, 42.0 and 34.9 bushels; Michigan, 40.0 and 32.2 bushels; Wisconsin, 46.5 and 36.3 bushels; and Iowa, 43.0 bushels as compared with the ten-year average of 38.3 bushels. Dry weather resulted in greatly reduced corn yields in South Dakota, Texas, Oklahoma and Tennessee. The average farm price of corn on December 1, 1925, was 67.4 cents, as compared with 98.2 cents a year ago. The farm price was 55 to 56 cents per bushel in Indiana, North Dakota, Iowa and Minnesota on December 1, 1925.

Wheat.—The 1925 wheat crop of 669,000,000 bushels was hardly large enough to meet domestic requirements. It was 23 per cent. smaller than the 1924 crop of 863,000,000 bushels, and 20 per cent. less than the five-year average of 1920-1924 of 835,000,000 bushels. In 1924 the United States crop was large and the world crop small, while in 1925 conditions were reversed with a small United States crop and about the normal world crop.

Winter Wheat.—Heavy abandonment of winter wheat plantings in the spring of 1925, due to severe winter killing during the winter of 1924-1925, in Kansas, Nebraska, Indiana, Ohio, Texas, Oklahoma, Montana, Washington, and Oregon, combined with yields per acre 15 per cent. below the ten-year average, resulted in a winter wheat crop in 1925 fully one-third less than in 1924. The 1925 production of winter wheat was 398,000,000 bushels, as compared with 590,000,000 bushels in 1924 and the five-year average of 592,000,000 bushels. The acreage of winter wheat harvested in 1925 was 31,269,000 acres, as compared to 35,489,000 acres in 1924.

The yield of winter wheat in 1925 was 12.7 bushels per acre, while in 1924 it was 16.6 bushels, and the ten-year average was 14.9 bushels.

Spring Wheat.—While the yield o spring wheat per acre in 1925 was one-fourth less than in 1924, the acr age was one-fourth greater, resultin in a production about equal to tha of 1924. The production of sprin wheat in 1925 was 271,000,000 bush els; in 1924, it was 273,000,000, an the five-year average was 243,000,00 bushels. The acreage of spring whea harvested in 1925 was 20,931,000 acre compared to 16,875,000 acres in 192 The yield of spring wheat harveste in 1925 was 12.9 bushels per acre 16.2 bushels in 1924, and 12.6 bush els was the ten-year average.

In 1924, with the United State crop on an export basis, there wa only a few cents difference in th December 1 farm price of winter an spring wheat. Spring wheat was 126. cents, while winter wheat was 131. cents per bushel. In 1925, wit Durum wheat, one of the spring wheat varieties, on an export basis the average price of spring wheat on December 1 was 132.3 cents, while winter wheat was 147.9 cents, a difference of over 15 cents per bushel

Oats.—A 5 per cent. increase in the acreage of oats in 1925, and a 7 per cent. decrease in the yield per acre, resulted in an oat crop about 1 per cent. smaller than the crop of 1924, but 13 per cent. larger than the five-year average from 1920-1924. The 1925 production of oats in the United States was 1,502,000,000 bushels, as compared with 1,523,000,000 in 1924 and a five-year average of 1,324,000,000 bushels. The acreage of oats harested in 1925 was 45,160,000 acres as compared with 42,756,000 in 1924. The yield per acre was 33.3 bushels in 1925, 35.6 in 1924 and 32.5 bushels for the five-year average. The yields of oats per acre in Ohio, Wisconsin, and Minnesota, were well above the ten-year average, while a lack of soil moisture cut the Texas yield over 55 per cent. The most striking change in connection with oats was a reduction of 20 per cent. in the December 1 farm price of oats from 47.8 cents per bushel in 1924 to 38.1 cents per bushel in 1925.

Barley.—The short corn crop of 1924 was undoubtedly a contributing factor to the increase of 20 per cent.

in the 1925 barley acreage. With the yield per acre about constant for the two years, the 1925 production of barley of 218,000,000 bushels showed a gain of a little more than 20 per cent. over the 1924 production of 178,000,000 bushels. The acreage of barley harvested in 1925 was 8,243,000 acres as compared with 6,858,000 acres in 1924. The yield of barley per acre was 26.4 bushels per acre in 1925, 26.0 bushels in 1924 and the ten-year average was 25.0 bushels. In sympathy with other feed crops the farm price of barley on December 1, 1925, of 58.6 cents was 21 per cent. less than the price of 73.6 cents in 1924.

Rye.—With the acreage of rye practically the same for both 1925 and 1924, the full effect of a 25 per cent. lower yield per acre was carried over to the total production of rye, which dropped from 64,000,000 bushels in 1924 to 49,000,000 bushels in 1925. The acreage of rye harvested in 1925 was 4,088,000 acres as compared to 4,019,000 acres in 1924. The yield of rye per acre was 11.9 bushels in 1925 as compared with 15.9 bushels in 1924 and a ten-year average of 14.4 bushels per acre. The farm price of rye on December 1, 1925, was 78.1 cents per bushel, or 27 per cent. lower than the price a year ago of 106.6 cents. There was a large world crop of rye in 1925, while in 1924 the world crop of both rye and wheat was considerably below average.

Buckwheat.—The 1925 production of buckwheat was 14,647,000 bushels as compared to 13,277,000 bushels in 1924. The acreage harvested in 1925 was 776,000 acres as compared to 738,000 in 1924. The yield per acre of buckwheat in 1925 was 18.9 bushels as compared to 18.0 bushels in 1924. The farm price December 1, 1925, was 89.2 cents as compared with 103.0 cents in 1924.

Grain Sorghums.—The production of grain sorghums in 1925 was 71,000,000 bushels as compared to 80,000,000 bushels in 1924. The acreage in 1925 of 4,120,000 acres was an increase of 8 per cent. over the 1924 acreage of 3,813,000 acres. A large portion of this increase was in Texas, where lack of soil moisture in the spring of 1925 caused abandonment and reduced plantings of other crops. The yield per acre in 1925 was 17.2 bushels or 18 per cent. less than the 1924 yield of 21.1 bushels per acre. The farm price of grain sorghum December 1, 1925, was 75.7 cents per bushel as compared with 85.2 cents per bushel in 1924.

Rice.—A 6 per cent. increase in acreage and a decrease of 4 per cent. in yield per acre of rice resulted in the 1925 production showing an increase of 2 per cent over 1924. The production of rice in 1925 was 33,959,000 bushels as compared with 33,249,000 bushels in 1924. The acreage was 904,000 in 1925, and 849,000 acres in 1924. The yield per acre was 37.6 bushels in 1925 and 39.2 bushels in 1924.

FARM PRICES OF GRAINS

The index number of the farm prices of grains for November 15, 1925, was 138 per cent. of the prewar average (Aug., 1909—July, 1914), of 100 per cent. as compared with 147 per cent. for November 15, 1924. This index number for the past year is as follows: November, 1924, 147; December, 1924, 155; January, 1925, 172; February, 178; March, 172; April, 152; May, 159; June, 164; July, 152; August, 157; September, 148; October, 135; and November, 138.

On November 15 the farm price of

PRODUCTION OF GRAIN CROPS IN THE UNITED STATES
(In millions)

	1925	1924	Five-year Average
Corn [1]	2,901	2,313	2,910
Winter Wheat	398	590	592
Spring Wheat [2]	271	273	243
All Wheat	669	863	835

Rice	34	33	40

---

[1] Includes corn for all purposes, including that hogged off and cut for silage, and forage, as well as that husked and snapped for grain, the yield for grain being applied to the total acreage to obtain an equivalent production figure for all corn.

[2] Includes Durum.

wheat was 168 per cent. of pre-war; corn, 116 per cent.; rye, 102 per cent.; oats, 94 per cent.; barley, 94 per cent. The general level of farm prices was 144 per cent. on November 15, as compared with 137 per cent. a year ago. The United States Bureau of Labor index number of wholesale prices of agricultural commodities for November 15 was 155 per cent of pre-war, and the non-agricultural index was 166 per cent. as compared with 150 per cent. and 160 per cent. in 1924.

LIVESTOCK

By E. W. Sheets
United States Department of Agriculture

Prosperity.—The year 1925 will probably be characterized in American livestock annals as the dawn of a period of considerable prosperity. There have been many signs on the horizon which promise that the patience and fortitude which have been displayed perennially by American stockmen are to receive a much-merited reward. The year 1926 should be the best since 1918.

As the present year nears its close, prices being received by producers for beef cattle, hogs, and lambs are well above those of a year ago; there is a fine corn crop; and the Western States have very promising prospects for winter ranges and a good supply of hay and other feeds. Throughout the year breeding stock of good quality has had steady demand at increasingly attractive prices, thereby confirming the faith of those who steadily refused to become discouraged during trying times. The man who took advantage of the opportunity to cull closely and add new blood to his herds and flocks is now in the way of being amply repaid for his foresight. Advance entry lists of our leading livestock shows verify other signs of the times, showing that breeders of livestock mean to continue to advertise their faith in their calling.

Purnell Act.—The Purnell Act, providing enlarged Federal support for agricultural experiment stations, beginning with an increase for each State of $20,000 for the fiscal year ending June 30, 1926, and mounting to $60,000 for the year ending June 30, 1930, and each year thereafter, was an outstanding event of progress in American agriculture during the year.

Quality in Meats Study.—At a meeting of the Experiment Station Directors of the Association of Land Grant Colleges at St. Louis in April, one of the four projects approved to be conducted with funds made available by the Purnell Act is one of interest to all livestock people entitled, *A Study of the Factors Which Influence the Quality and Palatability of Meat.* By the close of the year twenty-seven State experiment stations, the National Live Stock and Meat Board, the United States Department of Agriculture, and others were coöperating in steps toward the organization and inauguration of this study. A preliminary report and outline of the problems involved, together with a summary of methods and organization to be employed in the study, was published in October, 1925.

The new meats project is considered by many as representing a progressive step in livestock research of revolutionary character. The ultimate object of the study is to coordinate and render more practical the various technical experiments in the breeding, feeding and management of our domestic meat animals—to interpret the results of these various experiments in terms of the quality and palatability of meat, the end product.

U. S. Range Livestock Experiment Station.—Considerable progress was made in the development of the new United States Range Livestock Experiment Station at Miles City, Montana. This station consists of a tract of 57,000 acres transferred to the Department of Agriculture from the War Department by Act of Congress in April, 1924. Its location geographically, its topography, and the balance between its farming land and range land make it ideally suited to the study of range livestock and related forage and grazing problems. It contains 2,000 acres of grazing land, seventy-five miles of fencing, and is traversed by several miles of good roads. A breeding herd of 180 beef cattle and a band of 1,400 sheep and lambs had been established at the station by midsummer, 1925.

Livestock Improvement.—Under the "better sires—better stock" plan for extending the use of purebred sires, approximately 1,500 livestock owners placed their breeding operations on a purebred-sire basis during the fiscal year ending June 30, 1925. On September 30, 1925, this campaign had completed its sixth year of activity with a total of 15,969 persons enrolled. These owners listed 552,913 animals and 1,198,199 poultry. There were forty-three counties each having one hundred or more farmers improving their stock under the plan mentioned.

Federal Inspection of Slaughter.—Compared with the large numbers of meat animals slaughtered under the Federal meat inspection in previous years, the fiscal year ending June 30, 1925, experienced a slight decline. A total of 76,000,000 animals, or nearly 4,000,000 less than during the preceding year, but more than the average of recent years, were slaughtered under such inspection. Tuberculosis in cattle and swine was responsible for more condemnations at time of slaughter than all other diseases and ailments combined. This points to the wisdom of the campaign against tuberculosis and the necessity for continuing it with the utmost vigor.

A total of more than a billion and a half pounds of meat and meat products were certified for export in Federal meat-inspection establishments, as follows: beef and beef products, 191,075,309 pounds; mutton and mutton products, 3,035,375 pounds; pork and pork products, 1,394,205,841 pounds; horse-meat products, 2,159,230 pounds. Also a total of more than a million inedible animal products were certified by Federal inspection for export.

Livestock Emergencies.—Three emergencies constituting a menace to the livestock industry of America occurred during the past fiscal year. One was the continued presence in three counties of California of foot-and-mouth disease, which was discovered in February, 1924. Another was the appearance from a different source of the same disease in Texas. The third was the outbreak and rapid spread of European fowl pest in a number of Eastern and Midwestern States.

The last outbreak in California occurred on April 5, 1925, on previously infected premises. Diseased herds were promptly slaughtered and buried, frequently on the same day that infection was discovered, and the premises were promptly disinfected. Deer in the Stanislaus National Forest contracted the disease from infected cattle with which they mingled, but after a vigorous campaign all deer showing evidence of infection were killed.

The last outbreak in Texas was discovered in a herd on October 14 and this herd was destroyed the following day.

The outbreak of European fowl pest marked the initial appearance of this dread poultry disease in the United States. It was discovered in the fall of 1924 and was virtually eradicated by May 1, 1925, infection after that date manifesting itself only in one flock of chickens in New York.

DAIRYING

By C. W. Larson

Chief of Bureau of Dairying, Department of Agriculture

Conditions.—The year 1925 has been one of the most stable and uneventful of recent years as far as production and marketing are concerned. The year 1924 showed a material increase in production with a somewhat restricted buying power, which resulted in an enormous accumulation of butter in storage and a somewhat depressed market. The year 1925, on the other hand, absorbed all this surplus at a relatively good price. The prices of whole-milk and skim-milk products have been good, in contrast with the very low price for these products last year.

The special value of milk and its products has been brought to the consumer's attention through the press and especially through organized efforts supported by the industry and by State and national extension forces. Demonstrations at public institutions where large numbers of children are fed have proved that the liberal use of milk in the diet improves the health and the development of the child.

Production.—At the present time the supply and the demand for milk and dairy products just about balance. Our population is increasing at the rate of about one and a half million a year, and it is estimated that on January 1, 1926, there will be 112,500,000. The number of dairy cows on farms January 1, 1925, was 25,319,000—about 226 dairy cows for each 1,000 people. The average milk production of the cows in the United States in 1925 is estimated to be 4,368 pounds, containing 175 pounds of butterfat. This is an increase of more than 500 pounds of milk per cow in six years, which has been brought about by the general practice of heavier feeding, and to some extent, by the careful culling of low producers.

The coöperative cow-testing associations have grown to a total of 732 associations with 18,677 members owning 307,073 cows. The average production per cow in 260 of these cow-testing associations is 6,345 pounds of milk and 258 pounds of butterfat. The decrease in the official testing of pure-bred cows noted last year shows signs of improvement, and some new records have been made. The Holstein cow, May Walker Ollie Homestead 300043, still holds the United States record for butterfat of 1,218.59 pounds; and the milk record is held by another Holstein, Segis Pietertje Prospect 221846, with a record of 37,381 pounds of milk.

A better knowledge of how to feed intelligently has been noted. Through scientific investigations there has come to light the fact that minerals—especially lime and phosphorus—in the ration of dairy cows are essential to high milk production. There has been an increase in the use of concentrates for dairy feeding and especially of ready mixed feeds.

Market Milk.—The per capita consumption of milk at the present time is 55 gallons annually. Good, clean milk can now be obtained in almost every large city in the land, through better methods of processing and through more modern equipment.

More milk is now being shipped to the big markets by tank trucks and railway tank cars. Market milk delivery also has improved through the consolidation of many of the smaller companies into one large marketing organization. In many of the sections the final organization has taken the form of a coöperative association. Coöperative bargaining by the producers to sell their milk to better advantage has also been developed.

Dairy Products.—The amount of butter consumed per person in 1924 was 17¼ pounds as compared with 17 pounds in the previous year and about 15 pounds in 1920. Butter prices for the last year have remained very high. The manufacture of sweet-cream butter is gaining ground. Many large creameries are specializing in this product because of its good keeping qualities and its uniformity.

The per capita consumption of cheese in 1924 was 4.2 pounds as compared with 3.9 pounds the previous year and 3.5 pounds in 1920. Swiss cheese made from milk that has been clarified and made with the use of a special culture is now being manufactured in many of the large plants.

In both the butter and the cheese industry Federal inspection has been inaugurated, so that many large city governments and Federal institutions now buy these products on Federal inspection. *The Federal Market News*

Service, which was established in 1919, is an aid not only to the butter and cheese industries but to market milk industries in general.

The use of powdered skim milk and powdered buttermilk by-products of the butter industry is increasing, the former for baking purposes and the latter for feeding hogs and poultry. Three factories have been built to manufacture casein plastics.

The ice-cream production was slightly higher in 1925 than in 1924 when the per capita consumption was 2.5 gallons. Pasteurization and homogenization of the entire mix are now generally used.

In the field of manufacturing and marketing of dairy products, the development of enormous organizations for the manufacture and sale of dairy products should be noted.

FARM MACHINERY AND PROGRESS

By J. D. Davidson
Professor at Iowa State College

Period of Development.—The progress of American Agriculture has been due in a large measure to the development and use of farm machinery. Not only is the average farm worker now able, through the aid of machinery, to produce three times the quantity of agricultural commodities that he did seventy-five years ago, but much of the drudgery connected with farm operations has been eliminated and the general conditions surrounding farm labor have been improved. The greatest activity in the development and use of farm machinery came in the period immediately following the Civil War, when the expansion of farm land and the increased demand for food, furnished the stimulus. The present era is another important period of development, when the urge for a more extended use of machinery comes from an effort to reduce the cost of production through the more efficient use of labor. For labor is one of the largest items in farm operating costs.

Farm Machinery.—The development of farm machinery is, however, a gradual process, and new inventions or new machines cannot be put into immediate use. A quarter of a century was required to develop the reaper and secure the general use of harvesting machinery. For this reason it is difficult to point out great changes in attempting to record the progress of any one year.

A considerable advance was made during 1925 in the progress of substitution of the power of the internal-combustion motor in the form of the gas tractor for animal motors or horses and mules. It is now clearly recognized that the comparative energy-cost of power with the prevailing prices of petroleum fuels and horse feed is decidedly in favor of the internal-combustion motor. However, the more rapid substitution of mechanical power for animal labor has been delayed through inability to adapt the tractor to all kinds of farm power requirements, particularly in the growing of row crops. Rapid progress has been made recently in the development of a universal tractor not only adapted to the preparation of the seed bed but also to the planting, the cultivating, and the harvesting of row or intertilled crops. A limited number of these tractors were manufactured during the year 1925 and were used with good results.

Horse Power and Tractor Power.—In the wheat growing sections, particularly those with limited rainfall and low crop yields, the practice has grown of using larger teams of six, eight, twelve or more work animals. This practice economizes labor and with skillful management can be followed without detriment to the quality of the work performed.

A notable improvement in the application of the power of tractors has been made in the "power take-off" which transmits the power of the motor direct to those field machines requiring rotary motion. The use of the power-take-off gives a much higher efficiency in the transmission of the power required over the practice of transmitting all the power through the drawbar, with encumbent serious losses in the transmissions of the tractor and the machine. Field corn huskers and combined harvester-threshers are examples of machines operated in this manner.

Electric Power.—During the past year a national program for the study of the application of electricity to agriculture was culminated by a committee of allied interests, styled the Committee on the Relation of Electricity to Agriculture. This committee has been responsible for the forming of seventeen state organizations, created for the purpose of studying the problems connected with the use of electricity in agriculture. Many of these state organizations include rural communities for electrical development in which experiments in the use of electricity are conducted, and research problems are developed for public and commercial laboratories to solve. The Committee on the Relation of Electricity to Agriculture is an outstanding example of coöperation among industries to solve their mutual problems. The chairman of the committee is O. E. Bradfute, President of the American Farm Bureau Federation. The secretary is C. G. Neff, of the National Electric Light Association, and the managing director is E. A. White.

The combined harvester-thresher, a machine for the threshing of grain from the standing stalk, has been used for many years on the Pacific coast where the harvest-season is almost entirely free from rain. During the past few years this machine has been introduced extensively in the wheat-growing regions of Kansas, Nebraska, and adjoining states where a limited rainfall prevails. This machine materially reduces the cost of small grain growing. Experiments are being conducted in the artificial drying of grain by the forcing of a current of warm air through it after it has been placed in the bin. If this practice of drying grain can be successfully developed, the use of the combined harvester-thresher may be extended into the humid sections of the country.

The field corn husker, although a machine which has been under development for a period of more than twenty years, was purchased by farmers of the corn belt the past year in larger numbers than ever before. This machine more than doubles the amount of corn gathered by each man connected with its operation, and with favorable conditions of yield, soil and weather, reduces the cost of harvesting the corn crop.

Attachments for Tractors.—A large number of machines in the form of attachments for tractors are under development and are being put into successful operation. These machines provide better opportunity for control than separate machines do with a consequent saving of labor. A notable example of this type of machine is the ensilage harvester, which, when attached to, and driven by a tractor, will cut standing corn into ensilage and elevate it into a wagon drawn beside the machine.

Experimental machines cast their shadow before. At the Iowa State College an automatic or "manless" plow has been built, which has performed well in trials without the continuous attention of an operator. The plow is manually guided for an initial furrow and is self controlled thereafter. The tractor has right and left hand plows which are used alternately as the machine moves back and forth across the field, shuttle style, the direction of travel being reversed by the contact of antennæ with a fence or other barrier.

Mr. Arthur J. Mason of Illinois has built an artificial hay-curing plant and has developed a method of harvesting which eliminates all hand labor. The process is quite independent of the weather conditions. The saving of labor and the high quality of hay produced makes the method worthy of careful consideration.

DISEASES OF PLANTS

By R. J. Haskell
Associate Pathologist, Department of Agriculture

The growing season of 1925 was marked by periods of dry weather and extreme drouth in some areas. This deficiency in rainfall was unfavorable for many plant diseases, with the result that, in general, losses from this cause were unusually slight.

Cereal and Forage Crops.—Stem rust of wheat was more destructive than in 1924, but less so than in 1923. Although only slight injury was sustained by winter wheat, heavy losses resulted to spring wheat in Minnesota and the eastern Dakotas. It was of slight importance on oats and barley, and on rye it was practically negligible. The barberry eradication campaign was continued.

Bunt of wheat was unusually damaging in Pennsylvania, Maryland, Virginia and certain other states. The copper carbonate dust treatment for bunt control was the subject of several papers of the year. This chemical is now widely employed as a wheat seed disinfectant. In an extensive series of experiments conducted in the Pacific Coast States and extending over two years, Tisdale, Martin, and others (U. S. Dept. Agr. Bul. 1299) have determined the relative resistance to bunt of the commercial wheats in the United States. Tisdale and Tapke (Phytopath. 15: 59) demonstrated for the first time that infection by loose smut of barley could occur from spores on the seed.

Powdery mildew of red clover was common again this year. Its control with sulfur dust was reported from Oregon. A new bacterial wilt and rootrot of alfalfa has been described by F. R. Jones (Phytopath. 15: 243-244). A new Cladosporium spot of cowpea was reported by Gardner (Phytopath. 15: 453-457).

Field and Vegetable Crops.—That *Alternaria solani* can produce a rot of potato tubers as well as a blight of the vines has been shown by Folsom and Bonde (Phytopath. 15: 49). Working with potato blackleg, Leach (Science 61: 120) has produced evidence to show that the seed-corn maggot is a common agent of dissemination and inoculation of the blackleg bacillus and that the organism may overwinter in the body of this insect.

The white rot of onion (*Sclerotium cepivorum*), a new disease in this country, recurred in the Norfolk section of Virginia and was found for the first time in Kentucky. J. C. Walker (Jour. Agr. Res. 30: 365) has reported a new mycelial neck rot of onion caused by *Botrytis* sp., and has shown that artificial curing of the onion bulbs within two or three weeks after harvest has greatly reduced losses.

F. R. Jones and Drechsler (Jour. Agr. Res. 30: 293) described *Aphanomyces euteiches* as the most important cause of rootrot of peas in the United States.

Fruits.—In general fruit diseases were subnormal in prevalence but blight of apples and pears (*Bacillus amylovrus*) was bad in many states.

A new apple disease, perennial canker (*Gloeosporium perennans*), occurring in the Pacific Northwest, has been described by Zeller and Childs (Oregon Exp. Sta. Bul. 217). In an investigation of much significance to the nursery industry, Riker and Keitt (Science 62: 184) have reported that much of the so-called crowngall of apples is in reality not crowngall but overgrowths induced by other causes, especially imperfect union of stock and scion.

The disinfection of citrus fruits with borax solution to prevent bluemold rot was practiced more widely in California and Florida following recent experiments in its use.

A discovery of importance to those owning cocoanut trees in Florida is the finding for the first time in that state of the destructive budrot caused by *Phytophthora faberi*.

The Mosaic Diseases.—Much attention was given during the year to the mosaic problem. A general review of the present situation has recently been published by McKinney (Phytopath. 15: 189-202). His investigations (U. S. Dept. Agr. Bul. 1361) also have indicated that foliage mottling and rosette of wheat are different manifestations of a single transmissible mosaic, and that the causal agent overwinters in the soil. Johnson (Wisconsin Res. Bul. 63) has produced an infectious mosaic of at least two different types in tobacco by inoculating with extracts from apparently healthy potato plants, and concludes that most potato varieties uniformly possess the power of inducing mosaic in tobacco and other Solanaceous plants. A significant piece of work is that of Olitsky (Jour. Exper. Med. 41), who apparently succeeded in propagating the causal agent of tomato mosaic on an artificial medium. He concludes that the incitant of tomato mosaic is a living microbic body. On the other hand Mulvania (Science 62: 37) has been unable to confirm Olitsky's results and he suggests that more evidence is needed in order to establish the facts.

Plant Quarantine Measures.—Three public hearings of the Federal Horticultural Board were held for the purpose of considering quarantine action on account of plant diseases. The first, held June 30, was to consider the advisability of amending the existing quarantines on account of white pine blister rust. The second, and probably most important of the three, was called by Secretary Jardine November 16-17 to afford opportunity for full reconsideration of the restrictions governing the entry of narcissus and certain other bulbs, authorized to become effective January 1, 1926. These restrictions have been the subject of wide discussion both favorable and adverse and so a thorough review of the subject seemed advisable. The third, held December 8, was to consider the advisability of prohibiting the importation of wheat from certain additional countries where flag smut is now known to occur, and further to consider the removal of restrictions imposed by Quarantine 39 on account of take-all, since this disease is now known to occur widely in the United States. No action on any of these three matters has been announced to date (December 12).

Meetings.—In addition to its regular annual meeting at Washington, December 30, 1924, to January 1, 1925, and at Kansas City, December 29-31, 1925, the American Phytopathological Society held two summer field meetings. One was a cereal disease conference in Iowa, Minnesota, and North Dakota, July 8-14. The other was a Western meeting in conjunction with the Pacific Division of the Society held at Corvallis, Oregon, June 22-24. A summer meeting of plant pathologists was also held at Quebec, Canada, during the last week in July.

DISEASES AND PESTS OF ANIMALS

By J. R. Mohler

Chief of the U. S. Bureau of Animal Industry

Conditions.—According to the latest good estimates, there are on the farms of this country approximately 17½ million horses, 5½ million mules, 65 million cattle, 39½ million sheep, and 54½ million hogs, valued at over five billion dollars. In addition to the animals on farms, there are in the United States over two million head each of cattle, swine, horses, and mules, and about one half a million sheep. This vast animal population gives the United States first rank among the stock-producing nations of the world and we may justly be proud of our 8-billion-dollar live-stock industry. It equals in value our combined iron and steel industries and is more than twice as large as our lumber industry. But it is not only the magnitude of the industry that gives us cause for pride; we are producing purebred stock that compares very favorably with the best animals bred in countries much older than ours. This gradual improvement of our purebred stock is being reflected to our livestock in general, as more and better-grade stock is being produced.

With the increase in the value of livestock, responsibilities of livestock sanitarians in protecting the industry are becoming greater and more varied in character. At the same time conditions are developing which make their work more difficult. The increase in number and growth of towns and cities leads to the concentration of animals, especially dairy cattle, with the result that many are kept in insanitary places and deprived of exercise and freedom while they are being fed heavily for increased milk production. Such conditions are conducive to the rapid spread of disease and pests, and as they also decrease the vitality of animals, disease becomes correspondingly more destructive.

The space allotted will permit only of a brief discussion of some of these most destructive diseases and pests of livestock in the United States.

Tuberculosis.—Perhaps none of the diseases of domestic animals takes such a heavy toll as does tuberculosis, and since in animals it constitutes a source of danger to humans, it becomes from that fact also one of the most serious. It is a slowly developing disease and may be harbored in a herd without detection for a long time. In advanced cases of the disease the germs may be eliminated in the milk and, if not destroyed by pasteurization, retain their virulence in dairy products.

The annual losses from animal tuberculosis are estimated at about thirty-five to forty million dollars. Federal authorities are now engaged in a project in coöperation with State, county, and other local agencies to eradicate animal tuberculosis, and much progress has already been made. During the past year the combined State appropriations for this work amounted to about seven million dollars, and the Federal appropriation to about one-half that amount. The work has been a popular subject in the agricultural press and among farmers. A waiting list of 3,500,000 animals at the end of the year shows the desire among cattle owners to have their herds tested. More than seven million animals were tested during the year and 591 counties were engaged in systematic tuberculosis eradication. Since May, 1917, when the work was inaugurated, 78,805 herds, involving 1,357,619 cattle, have been accredited as free of tuberculosis. The total number under supervision is 1,231,692 herds containing 12,302,200 cattle.

Tick Fever.—Cattle fever ticks, the bane of livestock raising in the South, have been costing the industry from twenty to thirty million dollars annually. While southern cattle have acquired immunity to the disease in some degree, they do not thrive under tick conditions. The ticks, if allowed to reach a non-infested territory, produce the fever, which is a highly fatal malady to susceptible animals.

Tick eradication work was conducted during the last year in ten Southern States. Georgia was released entirely from Federal quarantine. Additional areas released from Federal quarantine included one or more counties in Arkansas, Florida, North Carolina, Oklahoma and Texas. The dipping season of 1924 resulted in the complete eradication of ticks from seventy-one counties that were heavily infested the preceding year. More than 25,000 dipping vats were in use.

Foot-and-Mouth Disease. — Early in the year 1924 foot-and-mouth disease appeared on the Pacific Coast. The United States had been free of this contagion since the outbreak of 1914. The work of the United States Bureau of Animal Industry in coöperation with State authorities kept the plague confined to sixteen counties in California. The customary method of slaughter and disinfection was used with effectiveness. The last appearance of the disease in domestic animals in that State occurred on April 5, 1925. The infection reached wild deer in the Stanislaus National Forest and the task of eradicating so virulent a plague from these animals in the mountains presented a new problem of great difficulty. A systematic campaign of eradication has apparently stamped out the disease among deer.

Late in September, 1924, before the California outbreak had been fully suppressed, the disease broke out in Texas. Investigation showed that infection in Texas probably entered through a Gulf port, there being no apparent connection with the outbreak in California. A force of inspectors from the U. S. Bureau of Animal Industry was immediately sent to the infected region to coöperate with State authorities and in thirty days the last known diseased herd had been destroyed. Again on July 30, 1925, the disease appeared in Texas on the same premises and immediate action was taken to eradicate the second outbreak in that section.

Early in May, 1925, the U. S. Department of Agriculture sent a commission composed of three scientists to Europe to make prolonged studies of foot-and-mouth disease with the object of acquiring further knowledge concerning modes of infection, possible means of immunization, and new ways of handling outbreaks of the plague.

Scabies.—The situation during the past year pertaining to scabies of cattle and sheep showed a measure of improvement. Outbreaks occurred in Arizona and, owing to prolonged drought in this State, eradication work was greatly hampered. There was also a slight increase of scabies in Kansas, Nebraska and South Dakota, but in other sections, especially Texas, Montana and Wyoming, conditions were greatly improved.

During the year Federal employees in coöperation with State authorities made 3,409,439 inspections of cattle and supervised 1,121,459 dippings in the field. They also inspected 24,953,861 sheep and supervised 4,071,375 dippings. Infection was found to be 15 per cent. less in sheep than in the preceding year.

Hog Cholera.—At no time since records have been kept on the subject has the death rate in swine from hog cholera been so low as in the past year. The disease was at a low ebb throughout the entire year, only 30 out of every 1,000 hogs on farms being lost from cholera compared with 130 in 1897 and 106 in 1914. Nevertheless, the monetary loss to farmers from hog cholera for the year ended April 30, 1925, was upward of $20,000,000, showing that the disease is still a menace to the swine industry.

A disturbing factor in the situation is the fact that in many localities farmers have assumed an attitude of false security and since the disease is not rampant they fail to keep the swine herds immunized or to follow other precautionary methods to prevent the introduction of infection. Under such conditions cholera may spread rapidly and heavy losses occur before outbreaks could be checked. Hence, the necessity for a close watch on the situation. During the year the U. S. Bureau of Animal Industry coöperated with thirty-two states in controling this disease.

Infectious Abortion. — Infectious abortion is causing yearly losses estimated at about 20 to 30 million dollars. The U. S. Department of Agriculture is coöperating with State laboratories in conducting agglutination and complement-fixation experiments looking to the development of uniform methods of applying laboratory tests.

Studies to determine the practicability of immunization against infectious abortion were continued by scientific institutions, especially to determine whether the use of living organisms of the disease would produce immunity when injected into virgin heifers. Other experimental work was directed toward overcoming Bacterium abortus infection of the udders of cows by the use of abortion bacterin, and also by inflation of the udders with chloroform fumes. Very favorable results have been obtained through the use of simple control measures in privately maintained herds.

Anthrax.—While losses from anthrax are not as serious as from some of the more prevalent diseases, it is one to be considered, since it still destroys about $2,000,000 worth of domestic animals each year and because of the fact that the infection is transmissible to man. The disease is reproduced through spores which are very resistant to climatic changes and survive for a long time in stagnant pools and marshy places of infected pastures where susceptible animals pick up the infection. Outbreaks of the disease are localized as a rule. The disease is most prevalent in the States bordering on the Gulf of Mexico.

The chief method of protection against anthrax is by vaccination with one of the immunizing agents now on the market. Animals which have died of the disease should be burned or buried deeply after covering the carcass with unslacked lime.

Parasites.—Parasitic diseases of livestock, other than infestation with cattle ticks (Texas fever), and mange or scabies, already discussed, include such important affections as the stomach worm infestations of sheep and cattle, the ascarid infestations of swine, cattle, horses and dogs; hookworm infestation of sheep, cattle and dogs; lungworm disease of cattle, sheep and horses; kidney worm infestation in swine; trichinosis of swine; nodular disease of sheep, cattle, and swine; liver fluke disease of sheep and cattle; gapes in poultry; blackhead in turkeys; ox warbles in cattle; various louse infestations, and numerous other parasitic diseases and conditions known to be of some importance but not yet adequately studied.

The damage from parasites is known to mount into millions of dollars yearly, but it is very difficult to estimate losses from parasites since much of the loss is in terms of lessened production of beef, mutton, pork, and wool, in damaged cow hides, and in the uninvestigated and unreported deaths of young animals. Control measures for the protection of young animals from parasites have been especially successful and profitable. These measures include the swine sanitation system developed by the U. S. Bureau of Animal Industry in McLean County, Illinois; the routine treatment of lambs for stomach worms; and the prevention of gapeworms by avoidance of areas used by turkeys, in raising chicks. Parasites are especially prevalent in the South and control measures must be established there before a profitable and extensive livestock industry will be possible in that section.

According to the best information available, it is estimated that the diseases discussed, along with lesser ones, such as hemorrhagic septicemia, blackleg, dourine, glanders, influenza and wounds, cause annual losses in domestic herds of the United States to the extent of approximately $200,000,000.

HORTICULTURE

By William A. Taylor

Chief of the Bureau of Plant Industry

Expansion.—Horticulture in America has broadened from the home garden and farm orchard beginnings of the early days to a group of undertakings widely varied in character, scattered in geographic location and divergent in climatic requirements. While there is extensive production of many flowers, vegetables and small fruits relatively near the large centers of population in most parts of the country, the trend of development along numerous lines, especially with fruits and vegetables, has been toward the centralization of production of these crops in sections where they can be grown satisfactorily as to yield and quality without much regard to distance from consuming centers.

Regional Culture.—The centralization of orange and grape-fruit production in Florida and of orange, lemon, and to a less extent grapefruit production in California; the growing of peaches for shipment north in the fresh state in Georgia and North Carolina are well known examples of this. The steady enlargement of winter apple production in western New York, the Pacific Northwest and in the mountain region of Pennsylvania, western Maryland and the great valley of Virginia and West Virginia are even more conspicuous when it is remembered that the apple succeeds at least fairly well in a large part of the country east of the Great Plains and north of the Gulf States.

These extensive regional developments of rather intensive, specialized production are in some cases due to the exacting character of the crops grown—as with the citrus fruits and the figs, olives and old world grapes of California, and the large-scale, out-of-season production of tomatoes, eggplant, celery, lettuce, potatoes, watermelons, muskmelons, etc., of the Florida, Gulf and South Atlantic States—and the similar extensive growth of Bermuda onions in Texas, and lettuce in the Imperial and other Valleys of the Pacific Coast and Rocky Mountain Regions.

Similar regional concentration of production occurs, however, with such staple perishables as peaches, native grapes, potatoes, cabbage, tomatoes, asparagus, etc., which are largely consumed in the regions where grown, but at long distances from the centers of production.

Transportation.—This scattered development of production, which renders North American commercial horticulture unique in comparison with that of the rest of the world, is due in large degree to the land transportation facilities afforded by the railroads, including the refrigerator car service, for but little of the perishable freight is water borne. For nearly a half century it has grown by leaps and bounds, notwithstanding the heavy transportation and refrigeration charges involved. Whether this trend will continue or gradually be replaced by enlarged production nearer and accessible to the consuming centers through motor truck transportation, as some believe, is one of the economic problems requiring solution during the next twenty-five years.

Apples and Pears.—An outstanding feature of American Horticulture in 1925 was the practically universal good yield and satisfactory quality of the apple and pear crops. Not for many seasons has there been a fair to good crop of these in all the important producing sections. While not attaining so large a total of merchantable fruit as in 1923, when 35,936,000 barrels were harvested, the apple crop (estimated in November at 31,312,000 barrels) was larger than the five year average, and largely composed of clean fruit of good size in all the leading production districts, when in most years there is partial or even total failure of the crop in some. The winter crop moved from the trees to market and into storage at prices which should render the fruit available to all classes of consumers throughout the winter.

Grapes.—The shipments of California grapes to eastern markets in the fresh state were unprecedentedly large. Early in December it appeared likely to exceed 72,000 carloads, in comparison with a total of 57,320 cars in 1924 and 55,000 cars in 1923. While this increased movement was in part due to the demand for table grapes to make up for the crop shortage in eastern producing districts, such as New York, Pennsylvania and Michigan, it obviously was largely due to increasing demand in eastern population centers for grapes for juice extraction for home use. In place of the former extensive production of wine and brandy in California, grapes are being moved by trainloads to eastern cities for domestic beverage production. The extent to which this continues will profoundly affect the future of the viticultural industry of the Pacific Coast.

Potatoes.—The sharply reduced total production of potatoes, due in part to the reduction of acreage as a result of the unsatisfactory returns to growers of this crop during the past two seasons, but still more to the unusually dry weather of June and July in the northern producing districts which cut the set and reduced the size of tubers. Unseasonably early freezes and snow in October caught considerable portions of the crop undug in the northern states. This threatened still further reduction of the available supply and developed a panicky condition in the market during October which forced wholesale prices to unprecedentedly high points from which they had gradually receded by the end of the year, though still remaining three or four times the prices of the preceding year.

The total crop of the year was estimated in November at 346,503,000 bushels, the December estimate of the crop of 1924 having been 454,784,000 bushels. The high prices stimulated imports from the Canadian provinces which appeared likely to exceed those of any recent year, notwithstanding the duty rate of fifty cents per cwt. on imported potatoes and the relatively light crop in Canada.

Floriculture.—In the field of floriculture the outstanding feature of the year was the enlargement of bulb planting for propagation, rather than for the production of flowers. While covering a wide range of species, such as tulips and several of the lilies, it was most extensive in the case of narcissus due to the imminence of the quarantine order of the Department of Agriculture in 1922, effective January 1, 1926, under which narcissus and some minor bulbs would be excluded from entering the country, except under exacting conditions of treatment for control of pests carried by such bulbs.

Information furnished by the bulb planters in connection with a conference on the quarantine matter held by the Secretary of Agriculture in November developed that plantings of narcissus in this country for propagation now total more than 1,400 acres, comprising more than 140,000,000 bulbs, including a very wide range of types and varieties.

FORESTRY

BY HENRY S. GRAVES

DEAN, YALE UNIVERSITY SCHOOL OF FORESTRY

Present Situation in Forestry.—Soon after the war a new movement of forestry was initiated with a view not only to extending the system of public forests but also to bringing about a better handling of private forests. This movement has made very substantial headway because the consequences of forest depletion have already begun to be felt in increased prices of lumber and wood products generally. Moreover, people are now beginning to realize the value of well-managed forests in protecting the sources of water supplies, in preventing erosion, in maintaining local industries that give an industrial vitality to rural districts, in furnishing a refuge for wild life, and for the service of forests as recreation grounds.

It is disconcerting to learn that the last great source of virgin timber in the East is confined to the far South and that the timber back of the larger mills will for the most part be removed within about a decade. Lumber prices have risen, in part because of higher labor costs, but in large part also on account of the increase of freight charges due to the recession of the forest supplies. More and more we are bringing into our eastern markets lumber from the Pacific coast. In 1924 the Northeast consumed about a billion and a half board-feet of Pacific lumber. The annual freight bill for transporting lumber now amounts to over $250,000,000 for the nation as a whole.

Seventy-five per cent. of the remaining virgin timber is west of the great plains and over half of it is located in the three Pacific states. Half of the lumber placed on the market each year is consumed in the region east of the Mississippi and north of the Ohio and Potomac rivers where there is almost no virgin timber left. Most of the lumber used in the country is still drawn from the virgin stands. Fully 70 per cent. of it comes from trees 150 years or more of age.

Unfortunately the timber has not been cut with a view to forest replacement. Succeeding stands are not such as might have been secured by the use of wholly practical methods of forestry. Many of the new stands have been injured by fire; they are inferior in density and grade and of relatively low growth and yield. Thus we find ourselves in the predicament of using and destroying our timber resources four times as fast as we are replacing them by growth. Softwood saw-timber is being removed eight and one-half times as fast as it is being grown, and of course the soft woods constitute our chief general utility material. We are actually burning up each year by forest fires about seven and a quarter billion board-feet of standing timber. In 1924 there were about 92,000 forest fires in the country that burned over some 29,000,000 acres of forest land.

It is the foregoing facts that have impressed the country with the need of some effective action to check further destructive agencies and to reduce the net drain on our forest capital. There is a very lively interest in the problem all over the country that is beginning to reflect itself in federal and state legislation and to some extent in efforts by private individuals to introduce better methods in the handling of their forest properties.

Federal Forestry Law.—The most important recent event has been the passage of the so-called Clarke-MacNary law by Congress on June 7, 1924. This act is directed primarily to the problem of private forestry. It is designed first of all to remove some of the most serious obstacles in the way of good forest management by private owners. First of all it sets up as an objective an annual expenditure of $2,500,000 for coöperation in the protection of forests from fire, chiefly on private lands. The actual appropriation for this purpose for the years 1925-26 made at the last session of Congress was $635,000. This money is made available for expenditure in such states as have an organized system of fire protection and which appropriate an amount at least equal to the federal allotment. In 1925 thirty states proved themselves qualified to receive this coöperation and they have themselves appropriated for the year altogether over $2,000,000, while private owners expended an additional sum of $2,000,000. This total of $4,635,000, including the federal funds, is in contrast to the sum of about $8,000,000 which is estimated as really needed to secure a reasonable protection of fire on the private lands of the country.

The Clarke-MacNary law provides further for a coöperative study of the problem of taxation of forest lands, designed to bring about a system of taxation which will not tend to discourage the growing of timber as is the case with the present general property tax. Other items in the law provide for extension work in forestry with farmers who own woodlots, for assistance in planting trees, for broadening the authority of the Government in purchasing lands for national forest purposes, and there are various other provisions not necessary to mention in detail in this article.

Government Forests.—One of the essential features of a national forest policy is the public forest. The National Forests now comprise some 157,000,000 acres of land. This includes about 2,000,000 acres of land purchased in the White Mountains of New Hampshire and Maine and in the southern Appalachians, under the authority of the Weeks law passed by Congress in 1911. It is of great importance to extend the system of National Forests to round out the purchase of areas where lands have already been acquired and to establish new units in the great timber belts of the Lake States and the southern pine region. The last Congress appropriated one million dollars for this purpose. It is very urgent to enlarge the funds available for this purpose. The National Forest Reservation Commission which approves all federal purchases of National Forest land has urged that the annual appropriations be increased to three million dollars.

Distinct progress has been made in the handling of the National Forests. The past year has seen a marked improvement in fire prevention, in spite of serious weather conditions. The development of airplane patrol has been a factor in the improved protective work, made possible by coöperation with the army and by a direct appropriation of $50,000. The local service of the National Forests continues to increase. About one billion feet of timber is now cut each year under forestry principles. Most of the reproduction is by natural means, but over 7,000 acres of formerly denuded lands are planted each year with thrifty forest trees. The forage on the forests is utilized under a system of regulated grazing, the total number of livestock thus allowed on the public property aggregating over eight million head. Each year an increasing number of persons use the forests for recreation. In 1923-24 the number of visitors had mounted to over ten million. The National Forests are now practically self-supporting as far as operating expenses are concerned. The receipts for the year 1923-24 amounted to $5,251,903.

A feature of national forestry of interest is the placing of the various military reservations, acquired for the most part during the war, in the hands of the Forest Service for the administration of the forests. These are located in fifteen states and aggregate about 350,000 acres.

State Forests.—The forest problem will not by any means be solved by the existence of National Forests and by other activities of the federal government. The central government must take the lead, but there is also a responsibility on the part of the individual states both in the matter of public forests and in securing good forest management on private lands. We look to the states to build up a system of state forests which will supplement those owned by the government, to direct the work of organized fire protection, to educate the people to greater care in the use of forests, to coöperate with private owners, and generally to look after the forest interests within their borders.

There are now thirty-one states which have a central forest agency of some kind. The work in forestry that is being done by the individual states varies greatly in amount and efficiency. As yet only a few states are giving to forestry the support it should have and which in the light of its economic importance they can well afford to give. Pennsylvania and New York lead in nearly all phases of state forest work. Each has a system of state forests and a well organized fire-protective system; each is making excellent progress in education through their technical forest schools, in planting waste lands, in extension work with farmers, in experiment and research and in developing a popular sentiment in favor of forestry. Pennsylvania has an aggregate area of 1,300,000 acres set aside as state forests and the legislature in 1923 authorized the presentation to popular referendum of a constitutional amendment that will permit a bond issue of twenty-five million dollars to extend the public forests by purchase. In New York a bond issue has been approved for fifteen million dollars for the purchase of forest and park lands. Of this sum five million dollars will be devoted to the extension of the state forest preserves.

Other states which have inaugurated the policy of building up a system of public forests are New Hampshire, Vermont, Massachusetts, Connecticut, New Jersey, Maryland, Louisiana, Kentucky, West Virginia, Virginia, Ohio, Indiana, Michigan, Wisconsin, Minnesota, South Dakota, Idaho, Montana, Oregon and Washington. A number of other states have acquired some areas for park purposes, as for example, California, but have no state forests. Altogether the states own about 8,700,000 acres of forest land of which about 75 per cent. has been definitely organized for permanent administration for public forest purposes.

State Forestry.—The chief activities of most states are devoted to fire protection and popular education in forestry. Several have enacted new tax laws, generally based on the principle of an annual tax on the land itself and a yield tax on the timber collected at the time of cutting, this to be applicable to areas of second growth and plantations. For the most part these laws are defective and have not been very successful. The new study of forest taxation now being inaugurated by the government should result in more effective legislation in this matter.

There are still some states where practically nothing is being done in the way of forestry. On not less than 150 million acres of land almost no effort is made to prevent forest fires. The most serious situation is in the Southeast. In 1923 over half of the forest fires of the country occurred in this group of states. The most backward states are Florida, South Carolina, Mississippi, Georgia, Arkansas, Oklahoma and Missouri. None of these states is qualified to receive federal aid in fire protection. There appears, however, to be an increasing interest in forestry in this region. Georgia, on August 12, 1925, passed a law providing for a state board of forestry and authorizing the employment of a state forester, but the appropriation was only $3,000, a sum far too small to make an effective beginning of work. Considerable public sentiment has been aroused in Arkansas but not enough to secure the passage of a constructive measure in the last legislature. Missouri has also passed a forestry law providing for a central agency in charge of the state interests, but the appropriation was vetoed by the Governor. A new law has been passed in Oklahoma providing for a forestry commission and a small appropriation of $5,000 given for its work. Efforts have been made in South Carolina to secure legislation for a forestry commission, but so far without success.

Private Forestry.—The most serious aspect of the present situation is the small amount of land under private ownership that is being handled under effective forestry methods. Excellent progress is being made in fire protection. A great many lumber companies are coöperating in this undertaking. Relatively few are, however, cutting their timber with a view to forest replacement. Probably over 95 per cent. of the lumber on the general market has been cut without any conscious effort to secure a new crop of trees. About 80 per cent. of the productive forest land of the country is in private ownership. Even with the most ambitious program of public forests the bulk of our future timber supply must come from private lands. The public is taking the lead and is assisting private owners in fire protection and many other ways.

It is hoped that a more liberal and a sounder system of taxation will be devised to prevent discouragement of forestry through the fear of burdensome taxation. The time is at hand when we may expect a more effective handling of forests owned by private individuals and companies. This together with a larger program of public forests should lay the foundations for a future service from our forests that will make them of great value in the economy of the Nation.

FISHERIES

By Lewis Radcliffe

Acting Commissioner, U. S. Bureau of Fisheries

General.—At the present time about 195,000 persons are engaged in the fisheries of the United States and Alaska; the investment exceeds $209,000,000, and the annual harvest amounts to 2,800,000,000 pounds, for which the fishermen receive about $92,000,000. These fisheries are highly important as a source of protein food and of products valued in the arts and industries. With rapid growth in population and limits on our acreage of tillable land, the products of the sea and the water products produced by water farming—aquiculture—will be in even greater demand than now.

Following the Great War the fishing industry passed through a period of acute depression. This was followed by a rapid recovery. Recently there has been a slowing down of this recovery and while the volume of production is greater, prices have been somewhat lower.

Canned Fish.—About 65 per cent. of our total harvest consists of food products; the balance being manufactured into products used in the arts and industries. Our food fishery products are sold fresh, frozen, canned, salted, smoked and prepared in other ways. In 1924 our canned fishery products were valued at $72,000,000. Canned salmon packed in the Pacific States and Alaska ranked first, with an output of 300,171,691 pounds, valued at $42,401,602. Other canned fishery products were valued as follows: sardines, $12,636,599; tuna and tuna-like fishes, $5,756,586; shrimp, $4,608,950; oysters, $2,478,044; clams, $2,161,389, and miscellaneous fish and shellfish, $2,121,419.

Of the total salmon pack 254,155,920 pounds, valued at $33,007,135 are credited to Alaska and the balance of 46,015,776 pounds, valued at $9,394,467, to the Pacific States. The pack of sardines in Maine, including one plant in Massachusetts, amounted to 47,498,125 pounds, valued at $7,191,026, an increase of 49 per cent. in quantity and 36 per cent. in value over the production in 1923. The California sardine pack was 65,622,672 pounds, valued at $5,445,573. The production of canned tuna and tuna-like fishes in California was 31,315,968 pounds, valued at $5,756,586, a decrease of 20 per cent. in quantity and 17 per cent. in value. The production of shrimp packed in the South Atlantic and Gulf States was 10,777,755 pounds, and of canned oysters, packed from Maryland to Texas, 6,712,215 pounds.

Frozen Fish.—In 1924 the quantity of fish frozen was 97,324,144 pounds as compared with 91,548,643 pounds in 1923. The more important species frozen were halibut, 14,650,787 pounds; salmon, 14,309,666 pounds; ciscoes, 13,195,023 pounds; herring, 8,695,698 pounds; whiting, 7,528,339 pounds; and mackerel, 5,457,696 pounds.

Fishery By-products.—By-products of the fisheries were valued at $10,000,000 and included 9,211,295 gallons of fish and whale oil, valued at $4,311,733; 76,254 tons of scrap and meal (used for fertilizer and as a feed for hogs, cattle and poultry), valued at $2,865,901; and 219,211 tons of crushed oyster shells (used for poultry grit and lime), valued at $2,019,254. Miscellaneous by-products include such items as fish scales from which is prepared fish-scale essence. This is used in the manufacture of artificial pearls. Shark hides are also included. These are used in the manufacture of leather used for novelty purposes.

New England Vessel Fisheries.—The landings of fish by American fishing vessels at the ports of Boston and Gloucester, Mass., and Portland, Me., amounted to 7,475 trips, aggregating 182,948,194 pounds of fresh and salted fish, with a value of $6,992,952 to the fishermen, representing an increase of 4.6 per cent. in quantity and a decrease of 0.8 per cent. in value as compared with 1923. The catch of cod and related species exceeded 157,000,000 pounds and of mackerel 15,300,000 pounds. The development of the market for filleted haddock, cod, etc. has been very helpful to the fishing industry of this section. The fillets are usually hardened in brine, wrapped in parchment paper, packed in tin containers and shipped in boxes with ice surrounding the metal container. In this form the housewife is assured of a sanitary, ready-to-cook product.

Condition of the Fisheries.—Many factors have contributed to the depletion of our interior and littoral fisheries. These include pollution, deforestation, reclamation, and irrigation projects, power dams and other obstructions to the free movement of fishes to their natural spawning grounds. Good roads and the increased use of the automobile have made accessible the remote lakes and streams and the number of anglers has increased with amazing rapidity. In several states the number of licensed anglers approximates 200,000 or more and the catch of the seven million or more anglers in the United States has become an important factor in the drain upon the natural supply. Improved methods of handling and merchandising have enabled larger numbers of our people to obtain and enjoy fish as food. Such conditions have brought about a reaction along two major lines. First, there is a growing demand for the conduct of biological investigations which shall supply the basic facts upon which wise legislation in aid of fisheries must be founded; and secondly, there is a greatly augmented demand for the conduct of fish culture on a much larger scale, to keep our waters adequately stocked as a source of food and for recreational purposes.

While there is scant evidence of depletion of our major sea fisheries, the evidences of depletion in the North Sea and around Iceland reveal the importance of assembling facts regarding our own offshore fisheries which will enable us to detect evidences of depletion before the capital stock is seriously endangered.

Biological Investigations. — Our people depend in large measure upon the Federal Bureau of Fisheries for the conduct of biological investigations. Its present program includes studies aimed to help in conserving and developing such important fisheries as those for salmon and halibut in the Pacific coast waters; the whitefishes and ciscoes of the Great Lakes; the mackerel, cod, haddock, and pollock of the North Atlantic; the blue crab of the Chesapeake Bay region; the mullet of the South Atlantic and Gulf coasts and the fresh-water mussel fishery of the Mississippi drainage which serves as the basis for the important pearl-button industry.

PERSONS, INVESTMENT, AND PRODUCTS OF THE FISHERIES BY GEOGRAPHICAL SECTIONS

Sections	Number of Persons Engaged	Capital Invested	Products	
			Pounds	Value
New England States (1919)	30,767	40,597,097	467,339,870	$19,838,657
Middle Atlantic States (1920 and 1921)*	55,244	38,774,431	863,681,626	24,407,785
South Atlantic States (1923)	16,298	8,505,225	228,747,930	5,087,340
Gulf States (1923)	17,793	10,535,905	160,324,042	8,096,650
Pacific Coast States (1922)	22,270	28,651,490	282,968,421	12,983,583
Mississippi River Division (1922)	19,122	7,345,034	105,733,734	4,503,521
Great Lakes (1922)	8,039	12,046,458	108,732,443	6,689,611

Alaska (1924)	25,194	62,660,637	583,425,000	10,400,000
Total various years (1918-1924)	194,850	209,256,232	2,802,373,838	$92,117,169

* Maryland and Virginia for 1920; other states, 1921.

Aquiculture.—For many years the Federal Government has artificially propagated many of our important food and game fishes on a very large scale, and especially in the case of our interior fisheries, has done much to offset the damage resulting from industrialization, in keeping these waters stocked with fish. In addition, important contributions have been made through the acclimatization of fishes. In this manner valuable fisheries for shad and striped bass have been built up in the Pacific States. The greater part of the eggs collected in fish-cultural work are secured from fish caught for market, which would otherwise be wasted.

The output of food and game fishes in the fiscal year 1925 exceeded 5,360,000,000. Winter flounder ranked first with 2,640,000,000, and cod second with more than one billion. These were propagated in the New England district. Pike perches, valuable food fishes of the Great Lakes section, were third with 238,000,000. The output of salmon exceeded 133,000,000; trouts, 92,000,000, and basses and sunfishes, 34,000,000. More than 167,000,000 fish eggs were allotted to State and Territorial fish commissions and 1,125,000 to foreign countries and the Canal Zone. More than 62,000,000 fish were salvaged from the overflowed lands along the Mississippi River, and before releasing these fish they were innoculated with 1,780,000,000 larval fresh-water mussels, thus contributing to the maintenance of supply of mussels. In addition to the work of the Federal Government, the States are now giving much greater attention to propagation and stocking of streams. During the past year greater progress has been made in North Carolina than in any other State.

The most important branch of commercial aquiculture in the United States is oyster farming. Our production of market oysters decreased from 25,000,000 bushels to 17,000,000 bushels in the decade beginning with 1912. In large measure this has been due to the depletion of the natural beds. For the restoration of this important industry we must depend primarily on oyster farming.

Survey of Wholesale Fresh and Frozen Fish Trade of New York.—New York City handles a larger volume of fresh and frozen fish and a greater variety of fishery products than any city in the United States. According to a recent survey, in 1924, eighty-seven wholesale establishments handled 394,000,000 pounds or in excess of 19,000 carloads of fresh and frozen fish, representing more than one hundred varieties. The wholesale value of these products approximated $40,000,000, and the investment exceeded $2,500,000. Direct landings by fishermen exceeded 50,000,000 pounds, chiefly cod, haddock, flounder, and mackerel. The per capita consumption of fresh and frozen fish in the Metropolitan Area was nearly thirty-two pounds per annum.

MARKETING

By A. W. McKay

Marketing Economist, Department of Agriculture

Problems.—The marketing of agricultural products presents a number of problems that in one phase or another are perennial. The growth of specialized producing areas, usually remote from consuming centers, has brought to the foreground problems of assembling, grading, processing, storing and transporting farm products economically and efficiently. The services demanded by consumers and the multiplicity of agencies that have arisen to perform these services have added to the cost of marketing. Some authorities claim that the farmer, on the average, receives no more than one-third of the consumer's dollar. One explanation of this is the small quantities and wide variety of food products which are bought by the average consumer.

Complaints.—A circular published in April, 1925, by the Port of New York Authority, states that the average purchase of lettuce is one head, or 1/7680 of a carload. Considering retail services only, it costs not far from $100 to sell and deliver a carload of lettuce in the 7680 lots in which it is sold at retail. The costs of the agencies that handle farm products between the producer and consumer, therefore, have been subject to serious consideration. The high cost of labor and material during recent years has increased the seriousness of the problem. Out of the consideration given to the subject some improvements and economies have been effected. It remains true, however, that there is little prospect of reducing the number of marketing services required and that the people who perform these services must be remunerated.

Costs of distribution have been increased by antiquated and inadequate terminal facilities in the large cities. Our cities in many cases have outgrown the railroad yards, warehouses and wholesale districts which were adequate 15 or 20 years ago. According to the publication quoted, it costs 42 cents to haul a 150-pound sack of Michigan potatoes 1120 miles to the terminal yards in Jersey City and 62 cents to haul the same sack to the store of the retailer, less than 15 miles, on the average, from the yards. Of the price the consumer in New York pays for Northwestern Winesap apples, 56.2 per cent. represents the cost of distribution within the city.

Fluctuations.—Furthermore, variations in yields and changes in general economic conditions have caused some violent fluctuations in the prices of farm products and have been responsible for heavy losses to the producers. The inflation of land values, high prices of labor, machinery, fertilizer and other supplies since the World War have made this situation all the more acute. Efforts to improve the situation by improving marketing conditions have been directed mainly toward raising and stabilizing prices of farm products.

Factors.—A brief discussion of the subject can deal only with the more important elements of the situation and the outstanding developments. Inasmuch as the marketing situation has changed since the appearance of the *American Year Book* of 1919, it is necessary, to some extent, to consider the subsequent period.

The outstanding factors in the marketing situation at the present time are (1) the development of coöperative marketing associations, (2) a realization of the close relationship between production and marketing, (3) the adoption of standard grades for many agricultural products, (4) efforts to bring about better methods of financing the marketing and production of farm crops and (5) the proposal of various plans for disposing of surpluses of agricultural products.

Coöperative Marketing Developments.—The shipping-point value of farm products sold coöperatively during 1925 was approximately $2,500,000,000. There are, in round numbers, 12,000 marketing associations in the United States at the present time, and 2,200,000 coöperating farmers, about one-third of all farmers in the United States. Approximately one-third of the coöperative business is handled by 100 large coöperative organizations, many of which have been formed within the last five years.

Agricultural coöperative associations are organizations of farmers formed for the purpose of performing marketing or other services at cost. Invested capital receives a return equivalent to a fair rate of interest, but no more. Profits or savings are returned to the members in proportion to their patronage. Control is vested in the members either in accordance with the one-man one-vote principle, or in proportion to patronage.

Whatever the future possibilities of coöperation in agriculture may be, its present accomplishments are important, though perhaps not susceptible to statistical measurement. It may be said, at the outset, that the coöperative leaders generally have abandoned the claim that a coöperative organization can secure immediately better prices for its members than can be obtained by farmers outside the organization. Coöperation, if it influences the price the farmer receives for his products, benefits the non-member as well as the member for the reason that private dealers usually are able to meet the competition of the coöperative.

However, it must be set down as the first achievement of coöperation that it introduces a new element of competition, and induces competing dealers to handle farm products on a smaller margin. Coöperation, also, has exerted an important influence in raising and stabilizing the grade and quality of farm products. The organized producers soon learn that their big opportunity to secure better prices than their unorganized neighbors lies in offering better products, uniformly graded and dependable in every respect. Standardization is one of the outstanding achievements of successful coöperative organizations. It has an effect on production practices. Undesirable varieties of fruit are eliminated, for example, and spraying, fertilization and cultural practices are improved in order to produce larger quantities of the desirable grades. It may make possible in time a better adjustment of the quantity produced to the demand.

Middleman Service.—A saving of the cost of middleman services, or the return of the profits of the middleman to the producers has been advocated as one of the great possibilities of coöperation. In general, the expectation of large savings from this source has not been realized. However, the concentration of a large volume of farm products in one organization does result in appreciable savings. Insurance and warehousing costs may be reduced. The actual cost of selling may be less. A part of such savings, of course, arise from the standardization of the product.

The number and nature of the private agences which coöperative organizations displace depend on the nature of the product and the strength and experience of the coöperative. In general, coöperation has begun with country assembling and packing or processing units. The distribution of products to the various terminal markets has followed the performance of these functions and the organization of terminal selling agencies is a later development.

A coöperative association may assume the functions of a number of such agencies in the same line of business, but there has been no general reduction in the number of middlemen services, though tendencies in that direction are in evidence. Some fruit and vegetable associations, for example, are selling direct to chain stores. A few milk marketing associations are engaged in the retail distribution of milk. Livestock shipping associations are selling to some extent, direct to meat packers, and grain marketing associations may sell direct to mills.

Relation of Coöperative Marketing to Production.—A stronger realization of the close relationship that exists between marketing and production has developed during the year. The Secretary of Agriculture has stated on more than one occasion that it is a function of the coöperative organizations to assist their members to adjust, as far as possible, the production of agricultural products to the probable demand. A sharp distinction is drawn here between the adjustment and limitation of production. Adjustment of production, in fact, may be brought about by a change in the kind of crops produced without an increase or decrease in the total production. What is sought, it is claimed, is a stabilization of production at a point which will permit a reasonable return to the producers and yet will furnish ample supplies to the consumers. It is argued that an undue limitation of production is undesirable from the point of view of both the efficient producer and the consumer. Inflated prices caused by inadequate supplies bring an inevitable reaction. Marginal land and marginal producers are brought into the business of growing the product, and a period of over-production and distressingly low prices follows. Many people consider it possible to maintain a balance of production which will bring adequate returns to the efficient producers, but which will not encourage marginal producers to enter the field and create large surpluses. It is admitted by those who take this view that natural hazards make an absolutely balanced production impossible. They contend, however, that the number of acres devoted to the growing of the crop is the most important factor and that it is possible to make definite progress in adjusting production to demand.

Crop Reports.—There are two supplementary methods advocated to bring about an adjustment of production. First, the extension of the crop reporting activities of the United States Department of Agriculture and the widespread dissemination of the Department's estimates and reports; second, the marketing of the product by strong coöperative marketing agencies. It seems essential to most students of this question that the statistical information collected by public agencies should be distributed and interpreted to the farmers by their coöperative organizations. There is the further suggestion that the organization engaged in marketing the product should have considerable influence in determining the acreage devoted to the production of this product by its members; and, in some quarters, it is advocated that legislation should be enacted enabling coöperative organizations to plan production programs with their members and with each other, and possibly to direct their members as to the production of the product. It is admitted, however, that any plans proposed for the purpose of adjusting production depend for their success on the understanding which the producers have of the problem.

Standardization of Farm Products.—Grades promulgated by the United

States Department of Agriculture are coming increasingly into use in the shipment and sale of farm products. As a result of the use of grade standards, it is possible to employ State or Federal agencies to certify the grade of certain farm products at time of shipment. Shipping point inspections of 131,087 cars of fruits and vegetables were made during the fiscal year ending June 30, 1925. By agreement with a large group of coöperative creameries in Minnesota, the State and the Federal Departments of Agriculture jointly inspect and certify the quality of the butter shipped under the organization's trade mark. Federal grades for grain, cotton and other products have been in operation for some time. Within the past year negotiations have been completed with all European Cotton Exchanges whereby the cotton standards of the United States are taken as the basis for trade in American cotton on those Exchanges.

Marketing Credit.—The marketing of agricultural products requires the use of large sums of money which must be made available during the harvesting season. For example, the cotton associations, marketing less than 10 per cent. of the cotton crop, require approximately $100,000,000. The ability of the small farmer, especially in the South, to control the marketing of his crops has been restricted by his obligations to merchants, bankers and others who furnish him production credit. It is impossible, therefore, to separate marketing and production credit in considering the influence of proper financing on marketing.

The requirements of the farmers for intermediate credit, that is, credit for periods extending from six months to three years, the length of time necessary to produce and market crops and livestock, have been met in part by the establishment of Intermediate Credit Banks, under the general supervision of the Federal Farm Loan Board. These banks are able to loan, on proper security to coöperative associations, or to discount the agricultural paper of local banks or credit corporations. On November 14, 1925, these banks had loans outstanding to coöperative associations totalling $47,305,845, and the total of their discounts was $26,277,385.

The formation of agricultural credit corporations has proceeded fairly rapidly. Such corporations are frequently fostered by coöperative marketing associations. They may make loans to farmers for production purposes up to ten times their total paid-in capital stock and surplus.

Warehouse Act.—The financing of marketing operations has been made easier by the operations of the United States Warehouse Act, which is administered by the United States Department of Agriculture. Provision is made under this Act for the issuance of Federal licenses to public warehousemen with a proper financial standing who agree to comply with the regulations issued under the Act. A coöperative association, an individual or corporation storing certain designated agricultural products in such a licensed warehouse receives a receipt which may be used as collateral for a loan. Federal supervision of the warehouses insures the integrity of the receipt. The marketing loans obtained by cotton and tobacco marketing associations are based largely on the security of receipts issued by Federally licensed warehouses.

Although the provisions of the original warehouse act were confined to wheat, cotton, tobacco and wool, it has been extended to cover other non-perishable and semi-perishable agricultural products, as broom corn, late potatoes, syrup and peanuts.

Proposals for Marketing Surpluses of Agricultural Products.—The most discussed proposal for disposing of temporary or seasonal surpluses of agricultural products has been the plan providing for a government financed and supervised export corporation. The governing board of this corporation would have authority to declare that an emergency existed in respect to any commodity, to take over the surplus, and sell it at such prices as it would bring in the world market.

Other proposals look to the encouragement of coöperative marketing as the most hopeful method of solving this problem. It is believed, on the one hand, that more effective distribution through coöperative associations will make it possible to market temporary surpluses without disastrous effects on prices. On the other hand, the better knowledge of market demands gained through coöperation should tend to prevent the production of burdensome surpluses.

Other Events of 1925.—Research in marketing problems was stimulated during the year by the passage by congress of the Purnell Bill, which provides an annual Federal appropriation to the state experiment stations for research in agricultural economics and related subjects.

Operating under the act providing for the regulation of the packers and stockyards by the Department of Agriculture, the Secretary of Agriculture dismissed a complaint filed earlier against the merger of the Armour and Morris companies, two members of the so-called "big five" in the packing trade. Under the authority of the Grain Futures Act, the Secretary ordered an investigation of conditions surrounding trading in grain futures on the Chicago board of trade, following violent fluctuations in prices during the spring.

AGRICULTURAL LEGISLATION

By J. Clyde Marquis

Director of Economic Information, Department of Agriculture

Sixty-eighth Congress.—The progress in national agricultural legislation in 1925 was confined to a few measures passed by the second session of the 68th Congress which adjourned March 4, 1925. Agricultural subjects were given relatively little attention in this session and the results in definite action were small in number, though at least one measure has rather far-reaching effect. The discussion reflected the first session of this same Congress when there had been an unusual amount of attention given to the agricultural situation centered on the several bills for agricultural relief and those designed to extend coöperation among farmers.

Purnell Bill.—The outstanding agricultural legislation of the year was the passage of the public law No. 458, known as the Purnell Bill, authorizing an increase of appropriations for research work as follows: for the year ending June 30, 1926, $20,000 is provided followed by increasing the amount $10,000 each year until in 1930 and thereafter $60,000 a year is authorized for each agricultural experiment station. These funds are to be applied to conducting "investigations or making experiments bearing directly upon the production, manufacture, preparation, use, distribution, and marketing of agricultural products and including such scientific researches as have for their purpose the establishment and maintenance of a permanent and efficient agricultural industry, and such economic and sociological investigations as have for their purpose the development and improvement of the rural home and rural life, and for printing and disseminating the results of said researches."

This legislation provides definitely for research by the state agricultural experiment stations in fields which have heretofore received relatively little attention. These funds are in addition to Federal funds already appropriated for the states under the Hatch and Adams' Acts.

Federal Farm Loan Amendment.—An amendment to the Federal Farm Loan Act and the Agricultural Credits Acts of 1923, public Law No. 599 was passed. This gave to agricultural credit corporations chartered by the United States Government the same privilege to rediscount paper with the Federal Intermediate Credit Banks as is now given to institutions chartered under State laws. This legislation was designed to foster the organization in livestock territory of livestock loan companies, thereby to improve the credit facilities in the livestock industry. Another Act was passed which authorized the Secretary of Agriculture in his discretion, to waive any part of or all requirements with respect to grazing fees for the use of national forests in drouth-stricken regions during the calendar year 1925.

Minor Legislation.—Other bills of minor importance provide for the extension of reforestation by the Forest Service; the transfer of certain war materials from the War Department to the Department of Agriculture; an extension of time when certain domestic animals that have crossed the boundary into foreign countries may be returned duty free; authorized the creation of game refuges in the Ozark National Forest in Arkansas, and the establishment of a forest experiment station in California. The second deficiency appropriation bill provided the funds to carry into effect the Purnell Act and also the continuation of several other activities of the Department of Agriculture. One important item provided $1,335,000 for fighting and preventing forest fires during the fiscal year 1925.

The President was authorized to create a Muscle Shoals Commission to study the facilities at Muscle Shoals, and to report to him before the next session of Congress.

STATISTICS OF AGRICULTURE

By Dr. O. C. Stine

Division of Statistical and Historical Research, Department of Agriculture

INCOME FROM AGRICULTURAL PRODUCTION IN THE UNITED STATES (1919-1924)

Item	Year Beginning July					
	1919	1920	1921	1922	1923	1924
	Million Dollars	Million Dollars	Million Dollars	Million Dollars	Million Dollars	Million Dollars
Current value of total capital invested in agriculture [1]	79,607	72,915	62,740	61,349	59,548	59,154
Gross income:[2]

Division of Statistical and Historical Research, U. S. Bureau of Agricultural Economics, Department of Agriculture. Compiled from reports of the Division of Crop and Livestock Estimates, U. S. Department of Agriculture.

---

[1] Values include land, buildings, livestock, implements, machinery, motor vehicles, and an allowance for cash working capital.

[2] Income as measured by the value of production less feed and seed requirements, in terms of weighted average crop-year prices paid to producers at the farm. This value includes products sold and products consumed on farms for family living. All farm products value includes other items in addition to those listed.

[3] Includes wages to hired labor, purchases of materials of production, taxes, rent paid on property rented from non-farmers, and interest paid on debts held by non-farmers.

[4] Net cash income plus value of food and fuel produced and consumed on farms.

[5] On the basis of 6,448,000 operators (owners and tenants). Farm operators' and family labor valued at wages paid to hired labor.

[6] As a reward for both management and use of capital.

STATISTICS OF AGRICULTURE

Division of Statistical and Historical Research, Bureau of Agricultural Economics, U. S. Department of Agriculture. Data for 1880-1920 compiled from reports of the Bureau of the Census. The production figures for census years are for the years preceding the census dates, i.e., 1879, 1889, 1899, 1909 and 1919. With the exception of the preliminary estimate of number of farms, horses and mules, reports of the Census for January 1, 1925, are not available, and figures for 1925 represent estimates *for that year*, subject to revision, of the Divisions of Crop and Livestock Estimates, and Dairy and Poultry Products, U. S. Department of Agriculture.

[1] Prior to 1890, asses and burros were included with mules.

[2] Dairy cows and heifers, 2 years old and over on the census date. The figures for 1910 are estimates of the Bureau of the Census for January 1, 1910. Jan. 1, 1925, estimate of dairy cows and dairy heifers over one year old.

[3] Calves and lambs included 1900-1925. Prior to 1900, census figures were nominally exclusive of calves and lambs.

[4] Figures for 1899, 1909 and 1919 include estimates of the Bureau of the Census for farms reporting cows, fowls, and sheep on hand, but no milk, eggs or wool produced. Figures for wool for 1879 are exclusive of the wool obtained from the fall clip of 7,000,000 range sheep.

[5] Production for 1924.

[6] Chicken eggs only.

[7] Production for 1924, chicken eggs only.

[8] Does not include pulled wool.

[9] Tame hay and wild hay not separately reported for 1879 and 1889.

[10] In 500-pound bales, gross weight.

[11] Louisiana only. Representing about 60 per cent. of total sugar cane produced.

WORLD PRODUCTION OF PRINCIPAL CROPS, AVERAGE 1909-1913, ANNUAL 1922-1925

DIVISION XIX
MINERAL INDUSTRIES

MINING AND ORE DRESSING

By Charles E. Locke
Massachusetts Institute of Technology

Good business conditions in general in America with a closer approach to normalcy following the war and its after effects, and also a further recovery of Europe, have been reflected in the mining industry during 1925 and have made it a satisfactory year without any of the features of a boom period. A good criterion is the iron ore shipments from Lake Superior ports, which, up to November first, amounted to 49,816,469 long tons. While this figure is not up to the high tonnages of some previous years it shows a marked improvement over 1924 with its 40,558,525 long tons over a similar period.

Prices.—Ranges in average monthly prices for the major metals have been 66.9 to 71.1 cents per ounce for silver; 13.3 to 14.7 cents per pound for copper; 8.0 to 10.2 for lead; 7.0 to 8.3 for zinc; and 51.4 to 60.5 for tin. All of these will show averages higher than in 1924. Lead stands out at the highest price for years, due to the uncertainty of a future lead supply sufficient to meet the demand. Copper has not kept up with the procession and many mines are operating at little or no profit on account of increased costs of labor and supplies and the overdevelopment of copper mines to a point where curtailment alone prevents an excess of production over consumption. The possibility of a further increase in the output of low-cost copper from the Katanga district in Africa is another big adverse factor. The price of basic pig iron ranged from $19.76 to $23.76 per long ton in 1925, making an average higher than in 1924. Other metals and metallic products had their various ups and downs during the year with perhaps more on the up side than on the down side. Arsenic showed a most decided slump because of a decreased demand. On the whole, the whole metal situation showed an encouraging tendency toward higher prices as the year came to a close. Gold mining continues to suffer under the handicap of a fixed price in terms of a dollar which has a lower value in terms of commodities.

Labor conditions have been exceptionally peaceful, the only major strike being that of the anthracite coal miners. Wages held at a satisfactory level and while slight labor shortage existed in some districts the supply in general about equalled the demand. The effect of a decreased supply of labor has been to force the operators to adopt more and more labor-saving machinery with the rather unexpected but pleasing result that the operators have found that efficiency was increased and costs reduced by the forced change. Other contributing factors to this improvement have been the various studies in standardization of apparatus and operations and the broad investigations of the U. S. Bureau of Mines in the many phases of mine work. Without gains such as these, many mines could not exist under the burden of heavy taxes from which they are suffering and for which they are begging relief.

Consolidation of the Industry.—The whole mining industry is undergoing a revolution. The day of the small mine is past. The number of mines is decreasing and new mines are discovered less frequently. Production to-day is coming more and more from large, low-grade deposits and the tendency is to consolidate into big units. Anaconda, in the copper industry, has come to hold a place similar to the U. S. Steel in the iron industry. Mining is becoming more like a manufacturing business. Increased production results not from new mines as much as from expansion of producing properties and from the ability to reopen and operate old mines at a profit under the stimulation of increased prices of metals and improvements in methods of treatment such as are referred to later under ore dressing and metallurgy. The only important discovery of new mines of recent date is that of the gold-copper deposits of the Rouyn district in Quebec.

Mining Technic.—Outstanding developments in present day mining technic may be summarized as follows:—Greater use of electrical power generated in central station units and for these central stations the Diesel engine is finding a place as the prime mover. Successful application of various methods of electrical prospecting and the adaptation of a sectional drill-rod system to the ordinary rock drill to enable it to penetrate up to 100 feet for prospecting purposes. Some installations of turbo compressors where the need of large units operating uniformly at full load allows their use, and an increased employment of small portable compressors driven by electricity underground or by either electricity or gasoline engine on the surface. The almost complete replacement of old style piston drills by the modern hammer drills with greater cutting speed up to a record of thirty-one inches per minute in granite under test conditions for one of the latest Gilman drills, and the limit is not set by the drill but by the ability of the manufacturers of drill steel to furnish a steel which will stand up under the powerful blows of the drill. Invention and use of the Gilman automatic heat-treating machine to insure proper uniform tempering of drill-steel bits for maximum cutting effect and minimum wear. Successful development of liquid oxygen as a commercial explosive for mining and general use of low freezing dynamites to avoid the necessity of thawing in cold weather. The advent of electrical shovels of the revolving type with long booms and mounted on caterpillar tractors in place of the old steam shovel on rails which had lower efficiency and higher operating cost. Machine loading underground by various types of mechanical shovels and scrapers to replace hand shoveling and thus speed up operations and reduce costs. The general use of electric locomotives of both the trolley and storage battery type in mine haulage with an increase in size of the storage battery type to put it more nearly on a par with the trolley type, and the greater field for gasoline locomotives in work on the surface where the exhaust fumes are not serious as is the case in the mine. The general adoption of electrical pumps of either the plunger or turbine types with the latter type gaining in favor. Electricity also coming more and more into vogue for hoists and supplanting steam and a beginning made in the installation of automatic hoists electrically operated without manual attention. A constantly widening field for systematic ventilation in metalliferous mines following the lead of coal mines. Electric lighting systems for the much-traveled underground places with the replacement of candles and open oil lights by the individual acetylene lamp at the working faces in all except the gassy coal mines where electric cap lamps are used for safety. A general improvement in living conditions together with more attention paid to the miner's welfare, safety, education and recreation.

Ore Dressing.—Just as the application of the flotation process revolutionized ore dressing ten years ago, so now the discovery of organic flotation reagents is revolutionizing flotation plants. The general tendency is toward larger and simpler mills and larger machines and higher efficiency with lower costs. Jaw crushers are in use with receiving openings as large as 66 by 84 inches, and rolls have diameters up to 78 inches by 24 inches face. In large plants the common practice is four steps of crushing using jaw or gyratory breakers to about 6 inches, gyratory breakers to about 4 inches, rolls or Symons disk crushers to 1 or 1½ inches and one or more steps of rod mills or ball mills below 1 inch to a final product of 1 mm. for tables or ¼ mm. for flotation. The rod and ball mills are firmly intrenched for fine grinding with divided opinion as to their relative merits. Gravity stamps are losing ground. Vibrating screens are being substituted for revolving and shaking screens. The new Fahrenwald classifier is a distinct advance in the art of wet classification. No important changes have been made in jigs and tables. Wilfley centrifugal sand pumps are driving out bucket elevators for handling wet pulp, while bucket elevators for dry ore are giving way to inclined belt conveyors which are less troublesome to operate.

A new process of separation based on dielectric constants is in the experimental stage and the Chance sand-flotation or heavy solution method which has worked so successfully on anthracite coal will undoubtedly expand to bituminous coal and then very likely to ores.

Flotation, Simplified Mill Practice.—The new organic flotation reagents, especially potassium xanthate, used in an alkaline circuit, usually lime, have in turn simplified and extended flotation. Oxidized ores of both copper and lead are now successfully filmed with a sulphide coating and floated just the same as natural sulphide minerals. Moreover, differential separation of two sulphides from one another is having far-reaching economic benefits. The copper man can eliminate much of the barren pyrite from his copper-sulphide concentrate and thus obtain richer concentrates and save on freight and smelting costs. The lead-zinc miner is now in the unheard-of position of being paid for both the lead and zinc in his ore or concentrates, because these can be separated by differential flotation into a lead product to the lead smelter and a zinc product to the zinc smelter. Formerly he had the option of shipping his entire product to the lead smelter and being penalized for his zinc or shipping to zinc smelter and paying penalty on lead.

Two specific examples will show the latest wonders accomplished by flotation. The Nevada Consolidated copper mill was formerly a combined gravity-concentration and flotation plant which in 1908 extracted 31 pounds of copper per ton from a feed containing 47 pounds per ton, and in 1919 extracted 22 pounds or 70 per cent. from a 32-pound feed at a cost of $1.075 per ton for milling and with a labor efficiency of 15.3 tons milled per man shift. With a new all-flotation mill in 1924 the extraction was 21 pounds or 87 per cent. from 24 pounds per ton in feed and the milling cost was $0.597 per ton and the efficiency 28.3 tons per man shift, and in 1925 from a feed containing 22 pounds of copper per ton the extraction was 20 pounds or 91 per cent.

The Cananea Copper Co. in 1923 operated with tables and flotation and did not eliminate any waste pyrite with the result that 2.5 tons of ore produced one ton of concentrate which analyzed about 4 per cent. copper, 15 per cent. insoluble and 35 per cent. iron. In 1925, on ore of the same grade (under 2 per cent. copper) an all-flotation treatment discarding pyrite with the gangue gave one ton of concentrates from about 10 tons of ore and the concentrates assayed around 19 per cent. copper, 7 per cent. insoluble and 30 per cent. iron. Moreover, the copper recovery was over 5 per cent. higher in 1925 than in 1923 and the net result of higher recovery and lower tonnage to pay for smelting in 1925 meant the difference between no profit in 1923 and a splendid showing in 1925.

COAL AND COKE

By R. Dawson Hall

Editor of the Coal Age

Bituminous Coal.—The year 1925 has shown that large tonnages can be obtained from the bituminous coal fields while the price remains at such levels as do not provide the operator a comfortable margin of profit. Throughout the year there was no car shortage and as a result, though many good mines remained closed, exceptionally large tonnages were produced, fully confirming the oft-repeated statement that there are too many mines and too many miners.

The year started with a good production, but the tonnage soon dropped to an extremely low level, the bottom being reached in the latter part of April when the output was only 1,251,000 tons per day. From that time on, the output began to improve, and the increase in tonnage has continued with slight pauses ever since, so that we have to go back to the hectic days of 1918, 1919 and 1920 to find tonnages as large. This sustained output at the close of the year was partly due to the winter season, partly to the prospect, and later to the occurrence, of the anthracite strike and partly also to the fear of the possibility of a general strike that would involve not only the anthracite but the bituminous fields also. Prices have been low. According to the Coal Age index they averaged in the first week of January $2.08, at the mine head; in the week of April 20 only $1.95; and in the last week of November $2.26.

Union and Non-Union Mines.—The larger part of the tonnage in the middle of the year, perhaps 70 per cent, was derived from the non-union areas where large wage cuts had been made. The union mines, which held to the Jacksonville scale of wages, were able to work only where freight differentials were sufficient to protect their local markets. Where there was less of such protection they were unable to work unless they were able to agree with a sufficient number of their men to accept a lower wage. This was the case in a number of areas such as the Pittsburgh, the Central Pennsylvania, the Fairmont and the Southwest. Several sections had become non-union in the year previous, having refused to bind themselves by the Jacksonville agreement.

Mechanical Devices.—The progress in mechanical loading so generally anticipated has not been made. With small cars such as served indifferently well with hand loading, general success with mechanical loaders seems dubious unless conveyors are installed, to obviate the need for placing cars one by one. Steady delivery of coal to a string of cars is an essential need of mechanical loading. Shuttling cars one by one to the point of loading involves too many delays where cars are small. With such small cars, conveyors without mechanical loaders may be an important advance; but loaders without conveyors are a less obvious success.

With large cars, however, and favorable roof conditions which permit of operation without a close set propping of the roof, loading has been very profitably performed with the aid of mechanical loaders without conveyors. Of course, many loaders have incorporated in their equipment some form of conveyor, but the reference in the foregoing is to conveyors that carry the coal beyond the machine itself and carry the coal to a point where it can be loaded into a string of cars moved steadily past the point of discharge. In Illinois the union has interposed difficulties, refusing to make a workable scale and requiring that the coal be shot only when no men but shotfirers are in the mine.

Types of conveyor that depend on the differential motion of a pan forward and back, have been introduced at a few bituminous plants during the past and preceding year. Their simplicity has much to recommend them, and they will doubtless prove themselves as efficacious here as in Europe, and as in the few anthracite plants that have been using them. They will operate on a down grade, on the level or even on a slight up grade.

The opposition of the union to any machines that reduce the need for labor is a difficulty to be met. Where men are scarce the introduction of machines is less resisted because there is no fear that the less competent men will be laid off.

Anthracite.—Many circumstances are restricting the output of anthracite. Among these are the activity of the oil-burner equipment companies, the progress of soft coal in the domestic markets of the West, the displacement of fine sizes of anthracite by bituminous slack, the increased output of by-product coke and even the activity of the gas companies. Nevertheless the anthracite companies shipped a goodly tonnage prior to the strike of September 1; and stocked also a large tonnage of all sizes, more, probably, than at any time in the history of the anthracite region.

At the beginning of July the United Mine Workers of America at the Tri-district Convention demanded that when a new contract be signed, the wages of day men be increased $1 and the tonnage rate of miners be raised 10 per cent. With these demands were others calling for pay for all manner of incidental services and for all kinds of special working conditions. Demand was also made for uniform scales for all classes of work as between miner and miner.

The operators were of the opinion that all these many advances and imposts would in aggregate raise the cost of coal 30 per cent. In addition the mine workers' union demanded that the coal companies collect from every employee the union dues, the collection of which is customary at union bituminous mines and is known as the "check-off." As such collections have been made partly with the purpose of swelling the union war chest with funds for use in unionizing non-union fields, this exaction was viewed not without reason as being unlawful.

The contending parties met at Atlantic City, and the operators declared that the present costs of production must be lowered to compete with the other fuels which have ousted anthracite in Western coal markets and were already severely jeopardizing the sales of anthracite in the Atlantic Coast cities where most of the anthracite now produced was being consumed. The National Industrial Conference shortly prior to the wage conference published a report on the increases of wages in anthracite mining as compared with those in other industries, showing that since July, 1914, anthracite wages had increased 192 per cent., manufacturing wages 129 per cent., railroad wages 141 per cent., illuminating gas plant wages 111 per cent., and electric light and power plant wages 121 per cent.

Discussion on the demands continued from July 9 to August 4 when John L. Lewis, President of the union, complaining that the operators were willing to concede nothing, withdrew from the conference with the other representatives of the mine workers. Sept. 1 the strike commenced and continued without marked incident till Nov. 28 when Gifford Pinchot, Governor of Pennsylvania, made a proposal which the mine workers accepted and the operators rejected without discussion.

The most important developments during the year other than those relating to labor were in regard to preparation. New standards were put into operation on April 1, which standards while bettering the company specifications that had come into effect since the war failed to equal in severity those private standards which had been in existence in earlier years.

Progress was made in a method of cleaning which depends on the sustaining quality of a quicksand maintained by agitation. In this quicksand, the purer coal floats and the rock and bone sink. About 22 plants are now in operation. A Belgian method of cleaning which depends on the old principle of sedimentation but provides more favorable means for reproving the sedimentary material is being introduced by two large companies and is now being employed by a third.

Fallen rock is being removed from old rooms most effectively by the use of loading machines that were originally devised for handling coal and ores, in this manner very greatly economizing in the recovery of old pillars.

PETROLEUM

By A. H. Hubbell

Managing Editor, Engineering & Mining Journal-Press

Year's Production.—Production of crude petroleum in the United States in 1925 established a new high record for the industry. A conservative estimate for the year, based on figures reported by producers up to the time of writing, places the total at 763,500,000 bbl. of 42 gal. each, or an average daily output of 2,091,780 bbl. Those who, in hope of better prices, had welcomed the drop in annual production from 732,407,000 bbl. in 1923 to 713,940,000 in 1924, the first decrease since 1906, were disappointed thus to see in 1925 an increase of about 7 per cent. compared with the year before. The Smackover field, in Arkansas, where new production, consisting chiefly of a heavy crude, was obtained from deeper sands discovered in February, thus reaching its peak toward the end of May, was chiefly responsible for this increase. As a result, Arkansas' output for the year, which it had been estimated would be about 45,000,000 bbl., ran as high as 80,000,000.

Oklahoma, Texas and California, which in 1924 produced about 540,000,000 bbl. or about 75 per cent. of the total domestic yield, accounted for 553,300,000 bbl. in 1925, a little less than 72 per cent. To this Oklahoma contributed 169,500,000, Texas 152,500,000, and California 231,500,000 bbl. The rest of the country produced, it is estimated, about 130,000,000 bbl., the Rocky Mountain region contributing 46,000,000, Kansas 27,000,000, Louisiana 22,000,000, and the Eastern area 35,000,000.

Conditions.—Events during 1925 helped bring about a clearer understanding of the domestic petroleum situation. The vigorous search for new pools and their rapid exploitation by competitive interests, when found, had in the several years preceding resulted in a flood of oil that continued throughout 1925, discouraging to those who needed better prices. Overproduction and unnecessarily rapid depletion of the country's oil resources were charged against the industry by some of the producers themselves. The real cause of this condition was, and is, the legal inability of operators to decide collectively to limit drilling and production, though some for selfish reasons would probably have refused to agree to curtail output even had the law permitted it. The so-called Doherty plan, proposed by Henry L. Doherty, for conserving oil, which to some seemed likely to put the industry under Government control, was first proposed in 1924. Before that year ended, the President appointed the Federal Oil Conservation Board to investigate conditions.

Federal Investigation.—In January, 1925, the directors of the American Petroleum Institute, the principal trade association, decided against the Doherty plan as a solution of the producing problem and appointed a committee to study the situation. The Federal Board, with Secretary Work as chairman, on beginning its conservation probe through the medium of questionnaires, soon found that the Government itself was an important factor in the current production of petroleum, the output from public lands, Naval reserves and Indian lands having amounted to 101,600,000 bbl. in the fiscal year 1923-24, or over 14 per cent. of the total domestic output. As a result Secretary Work recommended legislation to conserve the Osage oil lands in Oklahoma. Thus this recommendation became part of the Federal oil board's policy, and a step was taken in the direction of conservation.

Petroleum Institute Report.—Reporting in the fall, however, the Petroleum Institute's committee declared that exhaustion of domestic oil reserves was not imminent and that it was reasonable to assume that enough oil would be available for national defense and essential domestic uses until science should limit the demand by developing more efficient use of the oil, or substitutes for oil; or should displace its use as a source of power by harnessing a natural energy.

The logical deduction is that conservation is unnecessary. The report seems unwarrantably optimistic, however, based on hope rather than facts, and inspired by fear of Government control. Certain it is that the search for new production, whether from new pools or from deeper horizons in old fields, continues without regard for the condition of the market; and that the output of a pool, once found, quickly rises to its peak and then declines. When one considers that Oklahoma's 60,000 producing wells are averaging only about 8 bbl. per day, Texas' 20,000 about 18 bbl. daily, and California's 12,000 about 52 bbl. daily, the possibility of domestic shortage seems not at all remote.

Quantities.—With the low prices resulting from a glutted market and large stocks of oil in storage it is natural that wasteful uses should be made of crude petroleum. The demand for this commodity, all grades included, has exceeded the supply. In the first eight months of 1925 domestic consumption of crude oil (indicated) is estimated by the Petroleum Institute at 527,937,986 bbl. and exports at 74,016,858 bbl., making the total demand 601,954,944 bbl. To meet this 503,323,000 bbl. was produced, 57,046,017 bbl. imported and the balance drawn from stock.

The market for refined products was likewise weak throughout the year, in a state of collapse in fact, when gasoline consumption was at its peak. Excessive refining capacity, huge stocks of crude on hand, and the possibility of producing a synthetic gasoline by cracking whenever desired were evidently the causes of this condition.

Present Status.—Prosperity for the industry during 1925 is not indicated by a situation in which the principal factors were the following: a record output of crude petroleum in the face of prices already low; large stocks of both crude and refined oils carried over from the previous year; and the search for new production, at home and abroad, continuing with unabated vigor. Some control of drilling and production, either public or by private agreement, is necessary to prevent the obvious waste of this important natural resource. For 1926 the outlook is that the domestic industrial situation will continue much as it has been in 1925, with the chances in favor of a decline in output.

COPPER

By Leonard S. Austin
Mining Engineer, Los Angeles

Mining.—Many of the low-grade copper deposits, carrying 1.5 per cent. copper or less, are worked by open-pit methods. The deposit is blasted and loaded into railroad cars by steam or by electrically operated shovels of the caterpillar type, these showing a 10 to 20 per cent. economy of operation, because of the elimination of lost time; they show also increase of shovel output, and decrease of pit labor. Shovels of the revolving universal type are now made of about 50 tons weight, valued at $25,000, delivered, and operating at a cost, including interest and depreciation, of $3.50 to $4.50 per cu. yard. The method of drilling and blasting will depend upon the height of bank to be thrown down. Banks of 20 feet in height may be drilled by machine drills preparatory to blasting. Higher banks are churn-drilled, the holes sprung, and the ground thrown down by the larger charges. Finally, for banks of 100 feet it pays best to tunnel and chamber, to load these chambers with explosive, and to shoot down a great volume of rock together. The larger fragments are block-holed before loading.

It is to be noted that in mining the ore body at Jerome, where the steam shovel is used, a considerable overburden is removed. For smaller production the mill-hole or glory-hole system has proved to be quite as economical as removal by steam shovel, where for low cost of operation large quantity production is essential. The undercut system of caving accounts for a daily production of 40,000 tons of ore at present, and is therefore one of the most important of the mining methods applicable to low-grade copper deposits. The cost of such methods varies from 68 cents to $1.30 per ton.

The Price of Copper.—In terms of gold, new mining and metallurgical methods have united in the production of two pounds of copper to one in former years, and this technical efficiency is increasing, especially with large-scale operations. In prewar days, the average cost of producing copper was 8 to 9 cents, while cost in 1918 was 16 cents per pound. In cents of the 1925 dollar, this 1918 cost is reduced to 12.9 cents. This refers to the profitable mines, since there are always marginal properties in operation. However, some curtailment in production has been made during the past year, with a view of sustaining prices.

A factor in maintaining the price of copper is its increasing exportation, and the consequent reduction in the stocks available. This, with mine curtailment, is bound to increase the price and will encourage the large companies to resume full production.

The development of the electrical industry is chiefly responsible for the great increase in the demand for copper. Over half the copper used in the United States is thus used. Next to this comes the use for wire and rods and for automobiles.

Mucking and Loading.—The removal of the ore from stopes after breaking, where the ore was loaded to the tram car by hand shoveling, is now in many cases supplanted by machine loading, the broken ore being scraped up an inclined chute into the car, adding thus to the speed and efficiency of handling.

Copper Smelting.—The year 1925 notes the operation of many furnaces perfected in detail, especially in the line of side-charging the reverberatory furnace. This is performed by pipes leading down from the feed hoppers above, with a regulation of flow so as to maintain the furnace steadily filled where melting proceeds most rapidly. This way of charging has, it appears, been patented by Carson, who with a favorable decision, now feels at liberty to collect royalties due for many years. It seems probable this will stimulate charging methods which avoid such infringements. One example is the side-charging screw-feed by which the ore is propelled through the side walls into the furnace.

The Magma Smelting Works.—This is a reverberatory smelting plant of 450 tons capacity, now in successful operation on a mixture of custom ores and of flotation concentrates from the mill of the company, situated at the mine adit about a mile from the works. The watery concentrates are pumped by pipe-line to the smelter, and there de-watered on an Oliver filter. This product, mixed with the dry, crushed ore, is stored in bedding-bins, and thence sent to the roasters. All movement of ore is effected by conveying-belts to this point, while the calcine is trammed to the reverberatory furnace. The matte produced is converted and cast as blister copper for shipment to an Eastern refinery. The works merit close study as a well designed plant. (See *Mineral Industry*, 1924.)

Smelting versus Leaching.—Even as the blast-furnace is giving place to the reverberatory, so it may be expected that leaching and electrolytic precipitation will supersede smelting, since a high-grade product can be obtained, especially in the treatment of low-grade silicious copper ores, these latter being expensive to smelt. Nor are we to forget that flotation is destined to have its place in the concentration of mixed sulphides. In this connection, it is to be noted that many of the copper ores of the West carry an excess of unwanted iron, and this is to be eliminated by electrolytic precipitation, or more recently by differential flotation. Pyrite may be largely eliminated from an ore containing copper in form of chalcocite, covellite or bomite, irrespective of the presence of lead or zinc. This is done by the aid of sodium cyanide, which forms a coating of ferro-cyanides, which are in turn converted into hydrated oxide of iron.

The Katanga District, South Africa.—This region, extending for 300 miles, belongs to the Rhodesian Congo Border Concessions. Two of the properties there carry 3½ per cent. copper, but the paying mines are those of the *Union Minière*, the Star of the Congo and the Kambove. The cost of production at this leading property is 10 cents per pound, even on an ore that ranges from 6 to 16 per cent. copper, and with an output of 15,000,000 lb. per month. For all that, as the Union Minière opens up its properties, it may become one of the larger producers in the world, especially when rendered more accessible by rail, and with improved metallurgical methods, such as leaching in place of smelting, etc.

Leaching Practice at Ajo, Ariz.—The oxidized ore of the New Cornelia Copper Co. at this place, containing 1.5 per cent. copper, has been leached and electrolytically precipitated for the production of a high-grade electrolytic copper which is shipped directly to an Eastern refinery. Now sulphides are supplanting the oxidized material, and these are recovered by oil flotation in a 5,000-ton plant. The ore, crushed as heretofore in gyratory crushers and disk crushers to ¼-in. mesh size, is sent to the concentrating mill for final fine crushing in rod-mills of the Marcy type in closed circuit with Dorr classifiers. The overflow from the classifier passes first to the rougher flotation cells of the Callow-Inspiration type. Tar at the rate of a half pound per ton is added at the rod-mill; pine oil in quantity one-tenth of a pound just before the rougher cells. The rough concentrate passes then to cleaner cells, and finally to recleaner cells. From the flotation cells, the frothed concentrates go now to Dorr thickening tanks, 58 ft. dia. by 8 ft. deep, the thickened product to a collector tank, also 58 ft. dia., thence by gravity to an Oliver filter. The concentrate, carrying 12 per cent. moisture, is discharged on a 24-in. conveying belt to deliver to a 60-ton railroad car, being sent away to the Calumet and Arizona smelter for final smelting and converting to blister copper.

Refining.—The smelting plant and refinery of the Nichols Copper Co., at Laurel Hill near New York, incorporates many recent detailed improvements. The electrolytic refinery has a capacity of 25,000,000 lb. of copper monthly, operating on the series system. Ore and concentrates are received from domestic and foreign sources, some even from the Union Minière of South Africa. Since no reverberatory furnace is provided, all ore is crushed to sinter size, and agglomerated on a Dwight-Lloyd sinter machine for smelting. The furnace charge, taken from stock piles, is loaded into a car standing in a pit. When charged with coke, sinter and cold material, the charge-car is hoisted vertically, then transferred horizontally by an overhead rail system to the furnace charge-floor, and so to the furnace. The furnace, 39½ ft. long by 4 ft. wide at the tuyères, is blown with air at 20 to 40 oz. per sq. in., depending upon the speed that the furnace is desired to run. The oval settler, 14 ft. by 8 ft. in size, is lined with magnesia brick, and the outflowing slag stream from it is granulated with a water-jet and loaded into barges, which take it to sea and dump it, there being no dump room near the smelter. The matte is tapped into ladles, and transferred to one of the four small basic-lined converters. The converter-slag, carrying 7 per cent. copper, is sent back to the blast-furnace, while the blister is cast in blocks and sent to one of the ten anode-furnaces of 180,000 lb. daily capacity. Anode-casting is done at the rate of 15,000 pounds per hour. great care being taken to produce a smooth casting.

GOLD AND SILVER

By M. W. von Bernewitz
United States Bureau of Mines

Summary.—This short review of gold and silver is merely for the purpose of giving a general idea as to the status and indications of the mining industry. On the whole, the year 1925 was one of activity and increased operation. The year started favorably and ended better. This was also the case with our neighbors—Canada and Mexico. While our gold and silver mines had a good year, the production of the precious metals was enhanced by the greater production of base metals. The more activity in the mining and production of base metals the more gold and silver is produced, because approximately 10 per cent. of our gold and 70 per cent. of our silver are by-products of copper, lead, and zinc. There have been no serious labor troubles. The cost of supplies has remained at about the same level as in 1924, but with an upward tendency.

Reports from reputable engineers who recently have spent some time in the mining districts of the Western States are satisfactory and optimistic. More prospecting is evident in most of the larger producing States. Producers of all metals are busy and looking ahead. Market prices have been high for months and probably will continue so for the present.

American Production.—Figure 1 shows the production of gold and silver during the past twenty-five years, with prices for silver. This shows the trend at the end of 1925.

During the period 1905-1916, the yearly production of gold was relatively even, from 88 to 101 millions of dollars in 1915; it was well over 90 millions most of the time. Then, as will be seen from the curves, there was a fairly rapid descent to 49 millions in 1922, the result of economic conditions. Production picked up to 52 millions in 1924, and the indications for 1925 are that we may expect 55 millions. As to silver, we had been producing from 50 to 57 millions of ounces for twenty years to 1915, when it reached 75 million. Since then there has been a falling off, which was arrested in 1923, only to fall away again in 1924; but the year 1925 should witness an upturn, as shown.

Proportion in World Status.—The status of the United States as a gold and silver producer in relation to the remainder of the world may be shown as follows:

	Percentage of Total	
Year	Gold	Silver
1884	30	46
1889	27	42
1895	23	33
1900	31	33
1905	23	33
1910	21	26
1915	22	41
1920	15	32
1925 (estimate)	15	31

Briefly, the reason for our world standing in gold production dropping off from 30 per cent. to 15 per cent. is as follows:—The period 1900-1917 was one of high production, culminating in the record in 1915. The Boer War cut the Transvaal output to a fraction of what it was, but by 1905 it had picked up, and was ahead of the 1899 production. Australia, Canada, Mexico, and Siberia were at a high level. Still the American contribution was equal to 30 per cent. of the world. As Transvaal had more than recovered by 1905, the United States fell off to 23 per cent., although production was somewhat higher than before, and gained from then on to 1915, as did Canada, Mexico, and Siberia. Australia fell off meanwhile. As will be seen from the table above, America practically held its place from 1905 to 1915, inclusive. Then economic conditions affected mining in this country so that our record of 1915 was cut in half by 1921 and remained at about that point until 1924. Although Canada, Transvaal, and Mexico had slight setbacks, they continued to gain in production until the two first mentioned reported records for 1924; mining in those two countries was aided by the premium on the gold sold. Meanwhile Siberia fell off to a fraction of its former output, as did Australia to some extent, while Central and South America, India and Japan, and Rhodesia and West Africa practically held their own. As the result of these fluctuations America has fallen back to 15 per cent. of the world's total. The indications are that it will at least hold its present standing for a while, unless Canada and Transvaal continue to break records and Siberia returns to its old level; the former is likely but the latter not so for some time to come.

Future Prospects.—In discussing the gold-mining industry, A. B. Foote, president of the North Star mine at Grass Valley, California, stated in the November issue of *The Mining Congress Journal* that the high cost of labor and supplies is almost the only cause for the depression existing in the industry. Conditions can be expected to improve only if these costs become less. There has been a period of high prices after every great war, getting back to normal in 10 to 15 years; such a fall in production cost seems to offer the greatest hope for the future. The world-wide return to the gold standard and decrease in Federal taxes will help the present situation, but there seems to be no immediate prospect of a complete return to normal on account of the excessive cost of mining.

An extremely instructive analysis of the world's gold, and the status of the United States in production and holdings, is that of J. E. Spurr, editor of the *Mining Journal-Press* in that publication for April 25, 1925. As to the future, the general knowledge as a geologist-engineer enables Mr. Spurr to forecast that as the result of a thorough, aggressive, and scientific campaign of intensive exploitation, all over the world the relatively subordinate position of the United States as a gold producer will be permanent; and while the annual production may increase, it will not in the long run do so in proportion to the growth of wealth and trade.

Gold and Silver Movements.—Up to July, 1924, exports of gold from this country each month were only a few hundred thousand dollars, but in August over 2 millions was reported. Thence, the amount rose until 39 millions was shipped away in December. The year totaled 61 millions. In January, 1925, the amount was 73 millions, but it gradually fell off to 2 millions in August, and the first nine months of 1925 records 204 millions against 11 millions in the same period of 1924, according to the Bureau of Foreign and Domestic Commerce. Imports, on the other hand, have decreased from 269 millions in the first nine months of 1924 to 59 millions in the same period of 1925. However, the quantity of gold in the country amounts to 4¼ billions of dollars.

Exports of silver are practically the same to October, 1925, as in 1924—namely, 74 millions against 79 millions. Imports also are fairly close, 49 millions against 55 millions of dollars.

The net loss of precious metals in America through excess of exports amounted to nearly 170 millions for the first nine months of 1925. In 1924 the net gain was 235 millions in the same period.

Government Assistance to the Industry.—As the United States Bureau of Mines with the Mineral Resources Bureau of the United States Geological Survey was transferred from the Department of the Interior to the Department of Commerce at mid-1925, gold and silver producers are interested to know to what extent this Bureau, now under the control of a mining Secretary, will give them assistance in problems of mining and metallurgy. The general feeling is that Secretary of Commerce Herbert Hoover, more or less guided by his Advisory Committee, will see fit to expand the activities of the Bureau for safety and efficiency in mining of all types, as a basic industry (all mining) that contributes 5 billions of dollars annually to the country's wealth and half of the traffic of our railroads.

The Senate Commission of Gold and Silver Inquiry, created by Congress in March, 1923, expired by limitation in March, 1925. During this period the Commission made a fairly complete study of the industry and published thirteen reports of 6 by 9-inch size, covering a total of about 3,200 pages. Field hearings were held in ten States and one Territory producing gold and silver. The Commission was in close touch with all phases of the industry and eventually some tangible result may ensue from its recommendations.

Silver Market and Problems.—Silver averaged nearly 67 cents an ounce during 1924, but the current year will show an average of about 69 cents, judging by the market for the first ten months and the prospects. A gain of 2 cents an ounce does not seem much; but on a total of, say, 70,000,000 ounces it means additional revenue of $1,400,000 to American producers. The reasons for this strength in the silver market were firmness induced by events in China and their aftermath, purchases by India on account of a favorable season, and disinclination of America to sell freely. Europe was not a large factor in the market and was a small buyer. A curve of prices shows a depression from March to May, then an upturn to July, after which it was comparatively level to the end of the year. The higher price for silver has stimulated activity at all silver mines as well as at those producing the metal as a by-product, such as the copper mines in Arizona, Montana, and Utah, and the lead and zinc mines in Colorado, Idaho, and Utah.

As is probably known, producers of silver in 1924 organized the American Silver Producers' Association to protect and aid the industry by watching the market and any legislation that might be detrimental to producers. A second meeting was held at Salt Lake City in August, and production totaling 100 million ounces in North America was represented.

In discussing the outlook for silver, W. Mont Ferry in the *Mining Congress Journal* for November, 1925, believes that it may safely be predicted that it is encouraging and the price will have a strong upward tendency.

The re-valuation of fifty-four silver properties, by the Bureau of Internal Revenue, for purposes of computing invested capital and depletion allowance in connection with Federal income taxes was to have been discussed at Washington, D. C., on July 13. The principal question to be considered was the price factor to be used in determining property values as of March 1, 1913. The Bureau first used 65 cents an ounce for silver in estimating expected gross earnings, but proposed to use 57.78 cents, which would greatly reduce the valuations and increase the tax liability of the companies for 1919 and subsequent years. Naturally the producers objected, and the American Silver Producers' Association and American Mining Congress joined in defending them against the suggested re-valuation and increase of taxes. In September it was announced that no general re-valuation is necessary, but as errors were made in some of the original valuations, these should be corrected.

In order that the U. S. Treasury might save expense and waste in printing new, and calling in damaged, bills, an attempt was made to get 40,000,000 silver dollars in circulation in place of dollar bills. The silver money did not become popular; east of the Mississippi, at least, as fast as the coins were issued they were returned by the banks to the Treasury for currency that could be more easily handled. The campaign for extending the use of silver money was therefore abandoned for the time.

Gold and Silver Mining Compared by States.—The States might be designated in the following manner, in the order of their production:

Gold States	Silver States	By-Product Gold States	By-Product Silver States
California	Nevada	Utah	Utah
Colorado	New Mexico	Montana	Montana
Alaska	California	...	Idaho
South Dakota	Texas	...	Arizona
Arizona	...	...	...
Nevada	...	...	Colorado
Oregon	...	...	...
Idaho	...	...	...

Alaska.—Conditions in this Territory, particularly as to Federal control and development, were discussed at length by Governor S. C. Bone in *The Saturday Evening Post* for August 8, 1925, under the title, "Alaska from the Inside." No plausible argument in opposition to coordinated Federal activities in Alaska which would be conducive to the dispatch of business and general efficiency has ever been advanced. The ultimate remedy, Mr. Bone thinks, is full territorial form of government, preliminary to statehood at the earliest possible date. Curiously, in this analysis of Alaskan affairs, little mention is made of mining, but Mr. Bone says that Alaska is a land worth working for and living in. It has infinite possibilities and resources. Slowly, laboriously, surely, it is going ahead, and its outlook is bright with promise.

The U. S. Geological Survey did considerable field work in the Territory during the year and issued several bulletins of practical value on certain districts. The revival of gold dredging by a well-known company at Nome should result in an increased output or at any rate maintain the present scale.

One of our remarkable gold mines is the Alaska Juneau at Juneau. At present the monthly results are 300,000 tons of 65-cent rock mined. Of this, about half is discarded as waste and the remainder is milled. Costs are remarkably low—23 cents a ton for mining and 24 cents for milling. A surplus is now reported each month.

Arizona.—From the State Mine Inspector's latest report it appears that a number of companies that produce straight gold ores and silver ores or gold-silver and silver-gold ores are not shipping ore, although many are prospecting and developing. As usual, a third or more of the precious metals in this State came from copper mines. Mohave County contributes most of the gold ore. Two big mines shut down through exhaustion of ore reserves but three others have erected mills. The new sampler at Kingman has aided small producers considerably.

California.—In this State, gold is recovered by dredges and placer operations from ores from the Mother Lode district which is seventy miles long, from ores in the Grass Valley district, and from ores in scattered areas. Hydraulicking is restricted by the law which involves the construction of dams behind which the tailings or débris can be stored, but Major H. A. Finch of the California Débris Commission suggested in the *Mining Journal-Press* for May 16, 1925, that the Federal Government could provide a revolving fund for the erection of impounding dams, the cost of which could be met by payment for storage of tailings created by hydraulic operators.

In addressing the San Francisco Section of the American Institute of Mining and Metallurgical Engineers, J. M. Hill of the U. S. Bureau of Mines pointed out that much better mining, better metallurgy, and lower costs are necessary if the gold production of California is to be increased. Hydraulic and drift mining offer possibilities of considerable expansion. Operating costs are now at a high point and must be reduced. As adverse economic conditions are diminishing the production of gold, he advocates action to show a legitimate cause for a reduction of taxes, a central buying organization for mine supplies, and close contact between the metallic and non-metallic mining interests of California.

Regarding the taxation of gold mines in California, A. S. Howe in *Mining and Metallurgy* for April, 1925, discusses the present system employed by county assessors which he contends is not a logical one. An operating mine should not be taxed heavily and the idle mine taxed lightly; the former is of great public benefit and should be encouraged to continue its operations.

There are now nineteen dredges at work in California on six creeks and rivers. In 1913 there were seventy dredges. There is plenty of workable gravel available, but until the State and Federal restrictions are complied with these areas will not be worked. J. M. Hill of the U. S. Bureau of Mines forecasts gold dredging to be a thing of the past in about ten years.

Much of the silver and a little gold comes from the California Rand silver mine in Southern California, which has had a remarkable career since 1919. It is still going strong, and during the year ended June 30, 1925, the yield was 2,482,000 ounces of silver and 9,447 ounces of gold. Dividends continue to be paid and ore reserves are being developed at the rate of $2,500,000 in eighteen months.

From 1895 to date the Randsburg district of California has yielded $15,000,000 of gold, $10,000,000 in silver, and $11,000,000 of tungsten. The California Rand silver mine, already mentioned, is in the district, the geology and ore deposits of which are described by C. D. Hulin in Bulletin 95 of the State Mining Bureau, issued in 1925. This report of 152 pages is replete with maps and information of practical value. As to the future, the author of the bulletin does not believe that deep exploration of gold is justified unless an orebody is actually being followed or unless special structural conditions suggest such work, which conclusion also holds more or less for silver and tungsten.

In his description of the almost forgotten Calico silver district of Southern California, F. B. Weeks in the *Mining Journal-Press* for May 9, 1925, says that although it has produced 30 million or more dollars and is very close to two transcontinental railways and near a well-known part of California, few mining men know its locale. The drop in the price of silver to 63 cents in 1894, coupled with high costs and inefficient metallurgy, resulted in the cessation of operations a year later. There has been some desultory work since, more especially since 1920, but Calico is about the last of the old districts in which no attempt has been made to reopen and further develop the mines in depth below the rich ores, yet geologic and economic conditions warrant the expenditure of capital in resuscitating operations.

A bill for the regulation and control and licensing of persons, firms or corporations engaged in the business of sampling, concentrating, purchasing or receiving for sale ores, concentrates or amalgams bearing gold and silver, gold dust, silver or gold bullion, nuggets or specimens, to quote a State press bulletin, was passed by the last Legislature and became effective July 24, 1925. An annual license fee of $100 is issued only to bona fide residents of California, and then with a bond of $3,000. Records must be kept and be open to State inspection. Violations of the act may lead to fines and imprisonment.

Colorado.—According to reports of four District Inspectors to the Commissioner of Mines, the State as a whole registers more activity than in some time and the indications for 1925 to maintain this rate or increase were good. By September, many inactive silver producers in Colorado were reported as about to be reopened.

The Cripple Creek district is promising well at depth, to 3,000 feet, and the output is at the rate of nearly $5,000,000 per annum. The Portland mine reports very satisfactory developments at its 2,700-ft. level and is now pushing work at a depth of 3,000 feet. The company is treating $5 to $34 ore, mostly the former grade, but the cost of production, capital expenditure, and development do not leave much profit at present. The Cresson is doing better all the time and is making a profit equal to $700,000 a year. The orebodies under the seventeenth level are proving larger than expected. Some old properties in the district are to be reopened.

In the Telluride district the Smuggler Union and Tomboy, and in the Eureka district the Sunnyside mines, continue to treat about 18,000 tons of ore each per month. Gold and silver are produced as well as copper and lead. At Leadville the Jonny mine continues to produce rich gold ore and the Derry Ranch dredge is in operation.

Idaho.—Gold is found in practically all parts of this State, according to the State Inspector of Mines. It occurs commonly in quartz, also associated with base metals. A large proportion of the gold is recovered by placer operations, but most of the gravels that could be hydraulicked are exhausted, though considerable dredging ground remains. Silver is also widely distributed in Idaho, but mostly associated with base metals, so its production fluctuates with the production of the latter. The State also published several instructive bulletins on mineral deposits and the relation of mining districts to certain geologic conditions.

Nevada.—Conditions and production in this State were satisfactory and should continue so, aided by base-metal producers. Of the precious metals the silver districts of Comstock, Rochester, and Tonopah were busy. Tonopah is an important silver district, and also produces a little gold. The annual rate of production is $3,000,000 and is likely to be continued. Development is generally satisfactory, to a depth of below 2,000 feet in one mine. Early in 1925, gold was found at Gilbert, twenty-nine miles west of Tonopah, and a mild boom started, but little is heard of the place at this writing. Several small shipments of rich ore were made. The ore is described as a quartz breccia, in rhyolite.

New Mexico.—Press dispatches early in the year reported the discovery of great quantities of placer gold near Hillsboro in Sierra County, but nothing has been heard of it since.

South Dakota.—In this State the Homestake company continues its gold yield to $6,000,000 a year and is one of the world's leading producers. The company is expanding its operations and acquired quicksilver and antimony claims in the state of Idaho.

Utah.—This State in particular of the Western States is prospering as the result of the higher prices for all metals, and the Fall meeting of the American Institute of Mining and Metallurgical Engineers, which was held at Salt Lake City and attended by more than 400 representative engineers, was a happy and instructive convention.

Washington.—According to a graph accompanying a paper by L. O. Howard on metal mining in northeastern Washington in the *Mining Journal-Press* for June 13, 1925, the production of all metals, including gold and silver has steadily increased since the post-war slump of 1921. The silver is mostly recovered as a by-product. The straight gold mines are in the Republic district of Ferry County. Mr. Howard concludes that in spite of the difficulties of lack of capital, lack of adequate transportation, lack of correctly designed plants, and incorrect and illogical geologic prognostications, some fine results are being obtained in this region, which justifies the belief that some day it will be a steady and profitable metal producer. It has also been stated that if the mines of the Republic gold and silver district of Washington were consolidated and more capital were available, with cheaper power and the metallurgical problems solved, the district should respond. It has produced nearly $10,000,000 in gold and silver and three mines are being operated to-day.

References.—In addition to the publications issued by State and Federal Governments on various phases of gold and silver, several textbooks made their appearance during 1925. Brief notice of these is as follows:

American Institute of Mining and Metallurgical Engineers, Vol. 72, is devoted to mining and sampling. A number of papers describe the mining and sampling of gold ores, gold-silver ores, and silver ores, and these are summarized and conclusions drawn therefrom.

Richards, R. H., and Locke, C. E., with Bray, J. L.—*A Text-book of Ore Dressing.* A revision of the work of the same title published sixteen years ago.

Spurr, J. E., and Wormser, F. E.—*Marketing Metals and Minerals.*

The first work published on this subject. Among the chapters covering all metals, ores and nonmetallic minerals of industrial importance, are two devoted to gold and silver.

IRON AND STEEL

By Edwin F. Cone
Associate Editor of the Iron Age

Iron and Steel Output.—Early last year, when the usual estimates of the probable trend for the year were being made, predictions were to the effect that the steel output for 1925 would probably stand at a figure half way between the 1923 and 1924 totals. The 1923 steel ingot production at 43,485,665 tons was a record for all peace time years—and not far from the war record of 43,619,200 tons in 1917. Actual data for the 1925 production will not be available until later this year, but conservative estimates place the total ingot output at 44,100,000 gross tons, exceeding any previous war or peace time years. If the steel casting production is added to this, the country's total steel output for 1925 will approximate 45,400,000 tons.

Pig Iron.—A different story must be related regarding pig iron. The 1925 production will in no way parallel that of steel. Conservative estimates place last year's total of coke pig iron, as collected by *The Iron Age* each month, at 36,550,000 tons. In rank among the years, both war and peace-time, this total including charcoal will be about sixth. The record year was 40,361,146 tons in 1923. In the order of relative magnitude the six years stand as follows:

1923	40,361,146
1916	39,434,797
1918	39,054,644
1917	38,621,216
1920	36,925,987
1925	36,750,000 *

Scrap in Steel Making.—The gradual decline in the country's pig iron output with reference to steel is explained in only one way. Ever since the war there has been an increasing use of scrap iron and steel in steel furnace charges. The large accumulation of such material during the war was an incentive. As the years since the war have passed and as it has been found that scrap steel can be used in place of a certain amount of pig iron in the furnace charge—thus reducing the cost—the practice has expanded until today it is quite universal in all open-hearth steel making plants. Before the war the pig iron output was close to or exceeded the total steel; today there is a wide difference, that for 1925 of approximately 9,000,000 tons being the largest on record.

Steel for Building.—In building of all kinds, last year broke all records. According to the leading authority in this field, the Engineering-News Record, "the greatest building year in history" drew to a close with December, 1925, "without evidence of a let-up in the boom." The trend since 1924 has been definitely upward. Total construction for the year 1925 will approximate $7,490,000,000, breaking all records for the construction industry. Of the total $1,880,000,000 represents construction other than buildings. Steel, in greater or less degree enters into most of this work. The 1925 total of $7,490,000,000 compares with $3,621,000,000 in 1920—a gain of over 100 per cent.—and with $5,483,000,000 in 1923 and $6,012,000,000 in 1924. At least a $7,000,000,000 year is indicated for 1926, says the same authority. Buildings contemplated already amount to $5,500,000,000, with another $1,500,000 likely for work other than buildings.

Tin Plate.—In tin plate American output and consumption made a new record in 1925. Indications at the close of the year were that the heavy production of 1924 could be surpassed by at least 10 per cent. With exports less than in 1924, the American consumption was therefore strikingly larger. More and more has the canning industry expanded with new fruits and vegetables included in the program.

* Estimated.

Pig Iron Imports.—Lower relative production of pig iron with reference to steel is not entirely explained by the greater use of scrap in steel making. A large factor last year was the gradually expanding receipts of foreign pig iron, particularly along the Eastern seaboard. The 1925 imports approximated 400,000 tons or about double those of 1924. Most of this iron came from India, but England, Scotland, Germany and Holland contributed large quantities. At the close of the year only 10 out of 44 merchant furnaces along the Atlantic seaboard were active. These conditions constitute a menace to the American pig iron industry on the Eastern seaboard.

Iron and Steel Exports.—Signal as has been the achievement of the American steel industry at home both last year and during the last two or three years, its record in international trade has not been one to be proud of. Ever since 1920, when American steel exports reached the largest volume in their history because our market was the only one which could then supply the world's needs, sales to foreign consumers have been gradually declining. Last year total exports of American iron and steel were the smallest since the war—in the face of record making production at home. The following table presents the picture clearly in gross tons per month:

1925	137,600 *
1924	145,900
1923	162,100
1922	161,500
1921	181,000
1920	392,400
1913	242,300

The story of imports is also interesting as well as unfavorable economically—namely too much foreign steel and iron entering the country. The record for 1925 established a new one since the war for large volume of foreign iron and steel used by American consumers. As the year drew to a close, with data for 10 months available, the estimates were that the total steel imports for 1925 would approximate 70,000 tons per month.

Alloy Steels.—In 1909 almost no alloy steel was made in the United States. For every ton of alloy steel produced in that year, 131.6 tons of total steel was made. Increase in demand for alloy steel since then has been steady but rapid until in 1924, the latest data available, for every ton alloy steel made only 18.7 tons of total steel was produced. In other words in 1909 the country's alloy steel output was only 0.75 per cent. of the total, but in 1924—a lapse of only 15 years—this percentage had increased to 5.35 per cent., the largest on record. For the second year in succession over 2,000,000 tons were produced. The expansion since 1909 was seven-fold—"a truly notable achievement."

To-day the wonderful properties of alloy steels, as well as the discovery of new properties of plain carbon steels, has been made possible by the perfection of heat-treating processes and equipment. Only a few years ago a few American steel treaters and metallurgists formed a small society in Chicago and held a convention and exhibition. This was in the fall of 1919. To-day that society, now known as the American Society for Steel Treating, has expanded to a membership of over 3,500 and to an influence hardly second to some of the oldest scientific societies in the country. Heat treating methods have been put on a scientific basis and the benefits to industry are manifold.

Iron and Steel Capacity.—One of the interesting developments of the year just closed is the question of our steel making capacity. During the year a prominent head of one of the large companies questioned the published estimates of our capacity which vary according to their source. That of the American Iron and Steel Institute was pointed to as altogether too high while the objector's own figure was criticized as too low. The estimate of The Iron Age at 54,000,000 tons per year for ingots is about half way between the two extremes mentioned.

The result of this discussion and

* Estimated.

difference of opinion has been a decision by the board of directors of the American Iron and Steel Institute to investigate thoroughly the capacity of the country. A committee has been appointed which is to report on not only steel ingots but also steel castings and pig iron.

Prices.—Financially, the past year has not been as prosperous as others. The price levels of leading commodities have been relatively low so that, despite a year of large production, the companies' profits have not been heavy. This is particularly true of pig iron, especially that made by merchant furnaces. Competition from foreign iron as well as the sales of steel-making companies having excess pig iron capacity in times of lean order books for steel have been cogent factors in holding down prices. As the year drew to a close pig iron prices had advanced measurably, due partly to better demand and to higher-priced coke, caused by the anthracite strike. In finished and rolled steel, prices had also improved by the end of 1925. These advances, however, had little effect on the year's profits, since they applied mostly to this year's business. With price advances conservatively made in the closing weeks of 1925, the new year started out with favorable prospects for better profits than in the preceding one.

Electric Steel.—This somewhat disconnected but general review of the industry would not be satisfactory unless some mention were made of the American electric steel industry. From small beginnings about 15 years ago, when almost no steel was made in electric furnaces, the industry has developed very rapidly until today the American stands preëminent among the nations recognized as leaders in the industry.

Stainless Steel and Iron.—Probably the most outstanding development of a technical nature from both a practical and metallurgical standpoint, has been the progress in stainless steel and rustless iron. Stainless iron has limitless applications because of its lower carbon content, under 0.10 per cent., rendering it exceedingly malleable. Also, called rustless iron, it can be made into sheets, wire, plates and countless other forms and can be substituted for any material which soon fails because of rust. The only drawback to its general use is its price. It is now too expensive, as made by processes developed up to this time, but its ultimate cheapness is sure to materialize. It has the appearance of nickel plating but it never changes. It requires but little imagination to picture the possibilities of its general use.

Electrolytic Iron.—An interesting commercial development of 1925 was the establishing of a new plant at Niagara Falls, N. Y., for making electrolytic iron. The process was described in *The Iron Age*, September 10, 1925. It uses an anode of cast iron, cast directly at the blast furnace, and a cathode in the form of a grease-coated steel mandrel which revolves rapidly while deposition is proceeding. The electrolyte is ferrous chloride. The capacity of the plant will ultimately be about seven tons per day. The pure iron will be used for oil cans, cartridges, door knobs, grease cups, vacuum bottles, disks, etc., etc., and particularly iron tubes and sheets.

Nickel.—An outstanding feature of the past year has been developments in the nickel industry. When the naval disarmament program was adopted, the demand for armor plate vanished and with it about 60 per cent. of the sales of nickel per year. A new research department was organized, which, after intensive work, has developed new uses for the metal. The result has been a resuscitation of the industry.

Permanent Molds.—Mention should also be made of the progress in permanent molds in the foundry industry and of centrifugal casting. Quite rapidly are schemes developing for making iron and some other castings in permanent or metal molds, without the use of sand. A large future is opening up in this field. In centrifugal castings, large quantities of iron pipe are now being produced by the DeLavand and the sand-spun processes, both comparatively recent developments.

ZINC

By Walter Renton Ingalls

Consulting Engineer, New York

Ore.—The outstanding feature of the world's zinc industry in 1925 was the scarcity of ore. Australian production having been diminishing, and having been preëmpted by the Electrolytic Zinc Co. of Australia and by the smelters of Great Britain, Belgian smelters were constrained to look elsewhere for their ore supply, and bought largely from British Columbia, from Mexico, and even in the Tri-State district of the United States, where they entered into direct competition with American smelters. The supply of spelter in Europe has been insufficient for several years and America has been exporting a large quantity in that direction. From the standpoint of American industry it is preferable to export spelter rather than ore; but Belgian smelters, in their desire to keep their plants going at full capacity, could afford to buy American ore at no profit, relying upon other ores for their proper margin, and thus they were able to present a competition that American smelters could not easily meet.

Smelting.—Meanwhile the American zinc smelting industry continued to suffer from the over-built condition in which it has been since the war. At the middle of 1925 there were in the United States six zinc smelteries idle, with an aggregate of 20,984 retorts. Twenty-three were in operation, with an aggregate of 118,906 retorts, with an average of 69 per cent. of their capacity then in use. The American capacity for electrolytic zinc production was then about 90,000 tons per annum, which will be increased to 120,000 tons soon after the end of this year. The total capacity of active plants in the United States at the middle of 1925 was for the production of 780,000 tons of zinc per annum, soon to be about 800,000 tons. The actual production in 1925 was about 47,000 tons per month. Such partial operation, of course, produced an adverse effect on the cost quotient in respect of overhead, which is equivalent to saying that the American zinc industry as a whole is overstaffed.
